The Office of Production Management in Nov. 1941 had in itself 11 subdivisions. Outside the OPM stood the Office of Petroleum Co-ordinator (responsible to the secretary of the interior); the Board of Economic Warfare (*q.v.*); The Co-ordinator of Information; the Office of Facts and Figures; the Permanent Joint Board of Defenses of the United States and Canada; and the Office of Agricultural Defense Relations.

Of those named, the Office of Production Management, created Jan. 7, 1941, had the greatest bearing on defense projects. The success of its operations depended upon its ability (1) to divert production facilities to necessary war material production; (2) to keep the big companies from monopolizing defense work; (3) to bring every idle machine into use by subcontracting and farming out as much work as possible; and (4) to get and keep control of all needed raw materials and regulate their outward flow in finished form. To do the job, OPM in 1941 carried 3,000 people on its pay roll, which was budgeted at $10,000,000 a year.

It was early recognized by OPM that shortages were imminent in certain strategic raw materials. This was especially true in the case of seven essential metals—tin, tungsten, mercury, manganese, chrome, nickel and antimony. Every means, even to financing individual prospecting, was resorted to in order to assure a supply of these. Like shortages were realized in the supply of rubber and aluminum. Prompt measures were taken to curtail sharply nondefense use of such strategic materials, and, by the end of 1941, many substitutes were beginning to come on the market for formerly familiar articles. Cellophane, tin foil, lead foil, all forms of zippers had become taboo for ordinary civilian use. A drive was made in the summer of 1941 for the collection of household utensils made of aluminum, and old newspapers and magazines no longer found their way into trash cans or furnaces. Early in Jan. 1942 the Office of Price Administration banned the production of new automobiles; the sale of new tires had already been rationed.

When OPM was created, considerable demand was made through the press for the appointment of William S. Knudsen (*q.v.*) as the one-man boss of the new office. Instead, President Roosevelt named Sidney Hillman (*q.v.*) as his associate. The idea back of this arrangement was that there were three elements in the production picture—management (Knudsen), labour (Hillman), and the buyer (Stimson and Knox of the army and navy, respectively).

The new machine did not function any too smoothly, and critical-minded commentators continued up to Jan. 1, 1942, to insist on the vesting of control in one man, as had been done in the appointment of Bernard Baruch in 1917–18 as head of the War Industries board.

Recognizing the need for reorganization of the OPM, President Roosevelt appointed Samuel I. Rosenman, New York supreme court judge, to draft a plan. The ultimate result of his efforts was the creation on Aug. 28, 1941, of a new authoritative body called

the Supply Priorities and Allocations board (SPAB), with Vice-President Wallace (*q.v.*) as its chairman. Since Wallace had already been named chairman of the Economic Defense board, he stood in a rather commanding position in production matters. Donald Nelson (*q.v.*) was named as executive director of the newly created SPAB, and the remainder of the board's membership included Stimson, Knox, Knudsen, Hillman, Hopkins and Henderson. The latter's connection with SPAB did not interfere with his duties as price administrator. SPAB was set up (without pay roll or employees) to referee the continual points of difference between the price administrator and the priorities division of OPM. The former was concerned with controlling prices to combat inflation and protect the citizen consumer; the latter had only in mind getting necessary goods to the places where they could be quickly manufactured for military needs.

(*See* also PRIORITIES.)

The realization in 1941 that inflation menaced the U.S. economic and industrial structure even more than did strikes, made necessary the setting up of some form of price-control machinery. On April 12 the Office of Price Administration and Civilian Supply was established, with Leon M. Henderson (*q.v.*) as its head. The name of this agency was later shortened to Office of Price Administration.

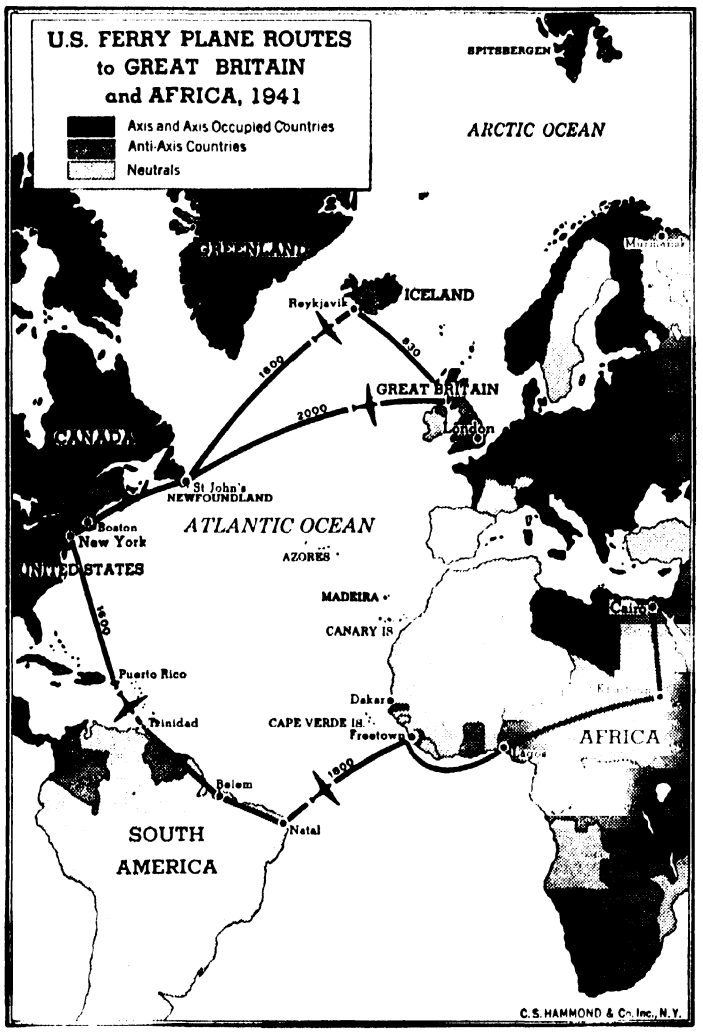
Price control was a necessary adjunct to stabilization of economic policy, but it was only one item. Paramount was the determination of how the mounting costs of war were to be met. Three plans presented themselves: (1) borrowing; (2) some form of inflation; (3) increase in taxes with a view to reaching a pay-as-you-go basis. The danger of inflation is such as to need no specific comment. The danger in borrowing is that it places too much power in the hands of small groups of the country's population. The solution in 1941 appeared to lie in putting the burden on the shoulders of all the people. As an aid to forestalling inflation, considerable money was taken out of circulation by the sale of defense bonds issued by the government. These were offered to the public in May. On Dec. 31, 1941, the president announced that thenceforth they would be referred to as "war bonds."

All financial matters connected with national defense insofar as they related to the OPM were closely correlated with other government agencies. War department contracts had first to be cleared through OPM, and in instances such as were produced by the acute shortage of aluminum, the OPM was compelled to seek the financial help of Jesse Jones (*q.v.*), head of the Reconstruction Finance corporation, in financing the erection of new plants to produce aluminum.

The Office of Civilian Defense (*q.v.*) was created to: (1) translate defense needs to states and towns; (2) co-ordinate civilian effort, and (3) boost national morale. The organization was headed by Mayor Fiorello La Guardia (*q.v.*) of New York city and included such prominent volunteer assistants as Mrs. Franklin D. Roosevelt and Mrs. Henry Morgenthau.

Labour.—During 1941 labour trouble, manifest in strikes, interfered seriously with production schedules for army and navy needs. The plant of the Allis-Chalmers company was struck for a long period, and termination of the strike through the efforts of William Hammett Davis as mediator was a matter of long-sustained effort to arrive at some basis of settlement. Trouble of the same character occurred in the Ford plant; in the Todd drydocks in Galveston, Tex.; and in great logging camps in the northwest. The North American Aviation corporation, Inglewood, Calif., suffered from a strike, as did shipyards connected with marine construction on both coasts; in Jersey City, the National Bearing Metals corporation lost time on contracts by reason of strikes; in August it was necessary for the president to order that the shipyard at Kearny, N.J., be taken over and operated by the navy because the Federal Shipbuilding and Drydock company had repeatedly refused to accept strike settlement measures offered by the National Defense Mediation board; the Bendix company incurred U.S. governmental displeasure in connection with labour troubles in its plant; the Buffalo Forge company and the Fairfield Steel works at Birmingham, Ala., settled their several differences and went back to work in October; in the coal mining industry, the captive mine strike in soft coal mining provoked near pitched-battle relations between President Roosevelt and John L. Lewis, C.I.O. president of the United Mine Workers. Speaking before the National Association of Manufacturers in the Waldorf-Astoria, New York, the chief of OPM, William Knudsen,

U.S. CARIBBEAN DEFENSES, showing existing naval bases and the bases leased from Great Britain in Sept. 1940



stated: "I can't for the life of me understand how in a declared unlimited national emergency, such foolishness as strikes can go on.... We have all kinds of work to do and then we have to stop and argue about jurisdictional disputes, organizational disputes and God knows what." The closed shop issue caused more trouble than the matter of wages and hours in 1941. The year closed on a hopeful note, however, when workers on the west coast requested the privilege of working overtime, free, to catch up time lost on production schedules because of strikes. (*See* also LABOUR UNIONS; STRIKES AND LOCK-OUTS.)

"The Atlantic Charter."—For 13 days in Aug. 1941, President Roosevelt dropped from sight in Washington, D.C. A veil of secrecy shrouded his movements, and it was not until his return that the incidents of his trip were made public. Somewhere in the North Atlantic he had met Prime Minister Winston Churchill (*q.v.*). The two exchanged ship visits and held frequent conferences from which emerged a document which came to be known as the "Atlantic Charter," an attempt to arrive at a definition of the aims of Great Britain and the United States as they concerned each other and as they involved other countries. The so-called charter contained eight points; viz.:

1. The U.S. and Great Britain seek no aggrandizement, territorial or other.

2. They desire to see no territorial changes that do not accord with the freely expressed wishes of the people concerned.

3. They respect the right of all peoples to choose the form of government under which they will live; and they wish to see sovereign rights and self-government restored to those who have been forcibly deprived of them.

4. They will endeavour, with due respect for their existing obligations, to further the enjoyment by all states, great or small, victor or vanquished, of access, on equal terms, to the trade and to the raw materials of the world which are needed for their economic prosperity.

5. They desire to bring about the fullest collaboration between all nations in the economic field with the object of securing, for all, improved labour standards, economic advancement, and social security.

6. After the final destruction of the nazi tyranny, they hope to see established a peace which will afford to all nations the means of dwelling in safety within their own boundaries, and which will afford assurance that all the men in all the lands may live out their lives in freedom from fear and want.

7. Such a peace should enable all men to traverse the high seas and oceans without hindrance.

8. They believe that all of the nations of the world, for realistic as well as spiritual reasons, must come to the abandonment of the use of force. Since no future peace can be maintained if land, sea or air armaments continue to be employed by nations which threaten, or may threaten, aggression outside of their frontiers, they believe, pending the establishment of a wider and permanent system of general security, that the disarmament of such nations is essential.

Later in the year, Churchill visited President Roosevelt in Washington, D.C., and addressed members of both houses of congress on Dec. 26, 1941, stressing the need of cementing the aims of Great Britain, the U.S.S.R. and the United States to the end that Hitlerism should be obliterated. Defense Communications Board.

The Defense Communications board,

created by President Roosevelt in 1940, co-ordinated plans in 1941 to utilize and safeguard U.S. radio and wire services under any emergency. A planning agency without operating or procurement functions, the board comprises representatives of various federal departments and agencies concerned with electrical communications. Its members are Chairman James Lawrence Fly of the Federal Communications commission; Assistant Secretary of the Treasury Herbert E. Gaston, in charge of the coast guard; Major General Dawson Olmstead, chief signal officer of the army; Rear Admiral Leigh Noyes, director of naval communications; and Breckinridge Long, assistant secretary of state in charge of the division of international communications. Advising the board are committees representative of labour, industry, amateurs, aviation, cable, domestic broadcasting, international broadcasting, radio communications, telegraph, telephone and government, state and municipal facilities, with civilian defense and priorities liaison committees. (*See* also FEDERAL COMMUNICATIONS COMMISSION.)

Defense Mediation Board, National. The National Defense Mediation board was created by U.S. executive order March 19, 1941, to adjust labour disputes in defense industries. Three steps were set forth for the board to follow in settling these controversies: (1) collective bargaining between the parties before the board; (2) if that failed, voluntary arbitration; and (3) if both of these failed, findings of fact and recommendations, which might be made public. Disputes were to reach the board only through certification by the secretary of labour, after the United States Conciliation service had been unable to settle them.

The board was originally composed of 11 members—four management, four labour and three public. Labour's representation was equally divided between the American Federation of Labor (*q.v.*) and the Congress of Industrial Organizations (*q.v.*). As the pressure of work increased, alternates from all three groups were added to the board, which reached a top membership of 41 during 1941. The first chairman, C. A. Dykstra, was succeeded July 1 by William H. Davis. Cases were heard by panels of the board, representing the three groups, which had the same authority as the full board. Only three cases were brought before the full board.

During 1941, 113 cases were certified to the board, involving a total of 1,190,789 men. Of these, 80 cases, involving 852,347 men, were settled at the year's end. Starting with a large backlog of unsettled defense strikes, the board gradually acquired the confidence of labour and management in its ability to settle disputes, so that it was able to postpone threatened strikes or bring an end to existing strikes merely by promising the parties a swift and impartial adjustment of the controversy. This voluntary method was working so well by the close of 1941 that during the whole month of December there was not a single stoppage of production in any of the 30-odd cases, involving nearly 350,000 men, still awaiting settlement.

The most important controversies handled by the board were those involving 7,500 employees of the Allis-Chalmers Manufacturing company, of Milwaukee, 160,000 employees of General Motors, 400,000 bituminous coal miners and 225,000 trucking employees in 12 midwestern states. Only four times did the board fail to settle controversies and have to refer them to the president for further action. The first involved North American Aviation, Inc., where the union called a strike during mediation, in violation of an agreement with the board; the second and third, involving Federal Shipbuilding and Drydock company, and Air Associates, Inc., where the companies refused board recommendations; and the fourth, the captive coal mine dispute, where the union rejected a board recommendation, and the C.I.O. members of the board resigned. By executive order the president ordered the army to take possession of the first and the third plants, the navy, the second. In the fourth case, the president's suggestion of arbitration was accepted.

Shortly after the United States declared war, a national conference of labour and management, convened by the president Dec. 23, 1941, agreed to settle disputes for the duration without resort to strikes or lock-outs, and recommended the setting up of machinery for peaceful settlement. This machinery was to supplant the National Defense Mediation board early in Jan. 1942. (W. H. Ds.)

The National Defense Mediation board was abolished by President Roosevelt Jan. 12, 1942, and all its duties, records, funds and employees were transferred to the National War Labor board, created by executive order on that day with William H. Davis as chairman and with 12 members representing industry, labour and the public. (*See* also LABOUR UNIONS.)

Defense Research Committee, National: *see* SCIENTIFIC RESEARCH AND DEVELOPMENT, OFFICE OF.

De Gaulle, Charles: *see* GAULLE, CHARLES DE.

Delaware. A state of the middle Atlantic seaboard, first to ratify the federal constitution (Dec. 7, 1787), popularly called the "Diamond state." Area, 2,057 sq.mi. (land, 1,978; inland water, 79). Pop. (1940), 266,505, of which 139,432 were urban and 127,073 rural. Native white numbered 215,695; foreign, 14,913; Negro, 35,820. Capital, Dover, 5,517. The only larger city is Wilmington (112,504).

History.—As 1941 ended, volunteer aeroplane spotters scanned the skies, retired blacksmiths were back at their forges, tire retreading firms were swamped with business, and in Wilmington B milk went up to 14 cents a quart. The general cost of living in Wilmington was 8.8% higher than in the preceding December; foodstuffs were up 17.4%, house furnishings 14.4%, housing 2%. But business was better (according to Babson, 20%), and in this area expansion in defense industries was expected to more than offset decline in other lines. Records were broken for Wilmington postal receipts (1941, $1,423,461; 1940, $1,307,625) and New Castle county marriage licences (1941, 6,614; 1940, 4,444).

The legislature passed 1,205 pages of laws, including: (1) a Fair Trade act permitting manufacturers to fix minimum resale prices for trademarked commodities; (2) acts for permanent automobile registration, and increasing highway speed limits up to 55 mi. per hour; (3) repeal of the ancient "blue laws" prohibiting worldly labours and amusements on the Sabbath; (4) an improved workmen's compensation law; (5) new regulations governing registration and election officials. The governor, in 1941, was Walter W. Bacon; the lieutenant governor, Isaac J. MacCollum.

Education.—In 1941 there were 175 elementary and 44 secondary schools with a total enrolment of 43,948 and a teaching staff of 1,720. The University of Delaware (Newark) had an enrolment in Dec. 1941 of 936 and a teaching staff of 128. The only other state institution is the State College for Colored Students (Dover); enrolment, 132; staff, 23.

Communications.—There were 3,930 miles of highways in 1941, all state, including about 1,000 miles of dirt roads, mostly in Sussex county; expenditures for the fiscal year to June 30, were $4,468,017.68, including federal aid amounting to $737,421.76. Railroad mileage (1938), 297. Water-borne commerce (1938), 564,430 tons. Airways, mileage (1941) about 10 (across northwestern corner of state); number of airports (est.), 8. Number of telephones (Nov. 1, 1941), 57,379.

Banking and Finance.—In 1941 there were 30 state banks with assets of $298,652,069.70 and deposits of $250,244,519.23. The 15 national banks in Delaware had assets of $25,659,786.17 and deposits of $19,916,903.44; 43 building and loan associations had assets of $13,645,917.31.

Agriculture.—The value of all crops in 1941 was $11,653,000; acreage was 348,980. Cash income from crops and livestock in 1941 was estimated at $22,125,000; from government payments, Jan.-Oct., $482,000. An extremely dry crop season reduced the yields of potatoes, sweet potatoes, hay and alfalfa. (*See* table on page 228.)

Manufacturing.—The value of products in 1939 was $114,753,652; salaries and wages of $30,210,159 were paid to 28,162 persons. The prin-

Leading Agricultural Products of Delaware, 1941 and 1940

Crop	1941	1940
Corn, bu.	3,925,000	3,800,000
Apples, bu.	1,794,000	1,900,000
Hay, tons	90,000	91,000
Wheat, bu.	1,332,000	1,272,000
Tomatoes, tons	39,000	37,000
Strawberries, crates	207,000	400,000
Lima beans, tons	8,930	5,650

cipal industries in 1939 were chemicals and allied products, valued at $20,350,136; iron and steel and products, $12,619,290; and leather, $11,784,718.

Mineral Production.—The value of all minerals produced in 1939 was $401,333.

Democracy is not only a technique of government, based upon freely elected representative institutions, and upon an executive responsible to the people; it is based upon the belief of the equality of all individuals and in the equal right of all to life, liberty (including the liberty of thought and expression) and the pursuit of happiness. The denial of this equality and of individual liberty, the proclamation of authoritarianism and of the inequality of men and races as a "new order," is characteristic of fascism, which arose as a conscious and aggressive world-wide opponent of democracy.

The world-wide threat to democratic freedoms and institutions brought with it a reassertion of the faith in democracy and of the determination to maintain the liberties of the democratic peoples even in the face of a most determined aggression. At the same time the awareness which the involvement in war brought with it produced in Great Britain an unprecedented intensification of the democratic spirit. The old class barriers which had maintained themselves as a survival of old England were waning, the workers accepted an increasing part of leadership and responsibility, and a spirit of national unity and of a common destiny embraced all groups of English society as never before. The continental European nations, suffering in an unprecedented way under the fascist regime imposed upon them by German conquests, reasserted their will to democracy, in spite of mass executions and the terrorism of the Gestapo. A wave of unrest swept Norway, the Low Countries, France, Czechoslovakia, Serbia and Greece in the fall of 1941. A similar new vigour of the democratic state was noticeable throughout Latin America where, influenced by the growing strength of the United States and the successful British resistance, many governments declared their increasing readiness to co-operate with the United States in the defense of hemispheric liberties and of democratic institutions. In the United States the declarations of war by Japan and Germany brought the nation to a united realization of the world-wide threat against democracy. (*See* also COMMUNISM; EDUCATION; FASCISM; FRANCE; GERMANY; GREAT BRITAIN; ITALY; JAPAN; PACIFISM; UNITED STATES; UNION OF SOVIET SOCIALIST REPUBLICS.)

Democratic Party. Following the re-election of President Roosevelt for a third term, the Democratic party, as it entered 1941, continued in control of the executive and legislative branches of the national government. When the 77th congress convened on Jan. 3, the Democrats held 66 senate and 267 house seats. Edward J. Flynn of New York remained as chairman of the Democratic National committee. In the house, Representative Sam Rayburn of Texas held office as speaker, with Representative John W. McCormack of Massachusetts as floor leader. In the senate, Alben W. Barkley of Kentucky continued as majority leader.

With the war already engulfing three continents, and moving ominously nearer the western hemisphere, the Democrats, as the party in power, faced heavy responsibilities in 1941. The country was too absorbed in watching the unfolding of the grim international drama, and in debating the future role of the United States in the fight against the axis, to take much interest in domestic politics. Compared with other years, there was little activity on the political front at home.

The war emergency strengthened the president's leadership in congress. Measures to expand the army and navy received quick approval by members of both parties in house and senate. Despite strong Republican opposition, congress voted to extend until June 30, 1943, the $2,000,000,000 stabilization fund, and the president's power to alter the gold content of the dollar. Early in the session congress also authorized an increase in the statutory public debt limit from $49,000,000,000 to $65,000,000,000.

With large Democratic majorities in both houses, the administration had little difficulty in securing prompt enactment of the bulk of its legislative program. Among the important measures approved were the 1941 Revenue act, to raise an additional $3,553,400,000 annually to defray part of the costs of the expanding defense effort; a bill to increase by $1,500,000,000 the borrowing authority of the Reconstruction Finance corporation, and the lend-lease bill, approved by the house on Feb. 8, 260 to 165, and by the senate on March 8, 60 to 31.

Though the Democrats supported most of the administration measures, on several issues the majority found itself divided. Fifteen Democrats in the senate and 53 in the house voted against the administration proposal to amend the Neutrality act to permit the arming of U.S. merchant ships and to authorize their entry into combat zones.

As a defense measure, the administration asked congress to extend for 18 months the military service of citizens called to the colours under the Selective Service act. The house passed the draft extension bill in August by the narrow margin of 203 to 202, with 182 Democrats and 21 Republicans recorded for the bill.

The wave of strikes in defense industries drew the fire of many Democrats, and created a demand for legislation to prevent work stoppages. On Dec. 3, the house passed a drastic defense strike bill, 252 to 136. Senate action was expected early in the 1942 session.

Many Democrats took the administration to task for its failure to take the lead in reducing nondefense expenditures, which amounted to approximately $6,500,000,000 in the budget for the fiscal year 1942. To explore possible economies, congress created a joint Congressional-Treasury Committee on Non-Essential Expenditures. Late in December this committee, whose chairman was Senator Harry Byrd of Virginia, submitted a report recommending a reduction of more than $1,000,000,000 in the nondefense budget, with cuts in agricultural aid, relief and public works appropriations.

In an exchange of telegrams with Representative Joseph W. Martin, Jr., head of the Republican National committee, Chairman Flynn, on Dec. 10, announced that the two political organizations had agreed to work together in the sale of defense bonds and stamps, in the recruiting of volunteer workers for civilian defense and in other war activities.

The arrangements for collaboration made by the two party leaders constituted the "most complete adjournment of domestic politics since the formation of the two-party system" the Democratic committee declared in a statement issued following the release of the telegrams.

On Dec. 21, Chairman Flynn announced the appointment of Edwin W. Pauley of Beverly Hills, Calif., as secretary of the Democratic national committee, to succeed Lawrence W. Robert, Jr., of Atlanta, Ga., who had resigned in Oct. 1940.

Responsibility for directing U.S. participation in World War II, as in World War I, rested with a democratic administration.

(O. McK.)

Denmark. A monarchy of north central Europe. Area, 16,575 sq.mi.; pop. (est. 1940) 3,844,312. Capital: Copenhagen (890,130). Other principal cities: Aarhus (99,881); Odense (85,521); Aalborg (55,652). Religion: Lutheran Christian. Ruler in 1941: King Christian X (*q.v.*); prime minister: Th. Stauning. On April 9, 1940 Denmark submitted to German military occupation.

History.—Denmark was in a better position than were most of the German-occupied countries in 1941; she had her king, her laws and no general destruction. King Christian still rode daily in the streets of Copenhagen, and he staunchly refused to sanction the introduction of Germany's racial laws. Yet Danish independence had been "modified" in many ways. Many Danes had been jailed for insulting or molesting the German soldiers who were "protecting" the country. Jewish co-operative society directors were ousted, and a nazi representative was put on each board. Because of the large proportion of business done by the co-operatives, this control was especially important. Danish agriculture was deprived of fodder and fertilizer, and was forced to sell livestock in return for German goods and credits.

Outside Denmark, some 244 of the nation's best ships escaped nazi capture. Most of these vessels, amounting by July 1941 to some 750,000 tons, were sailing directly or indirectly for Britain, flying the British "red duster" but with the Dannebrog at the foremast. Twelve new tankers had been of great use. On March 30, 1941, the United States took into "protective custody" 39 Danish ships, along with many German and Italian vessels. The United States Maritime commission soon took title to 15, and in July to 16 more, refitting them and putting them into service. Some 53 Danish ships were sunk by the Germans from the beginning of the war to July 1941; but so far as was known, none was sunk by the British. In Feb. 1941 news came via Stockholm that the Germans had requisitioned 10 naval torpedo boats from Denmark.

As ships disappeared, so also did the colonies which Germany could not reach—the Faeroes, Greenland and Iceland. On April 9, 1941, the United States signed an agreement with the Danish minister, Henrik de Kauffmann, assuming a practical protectorate over Greenland (*q.v.*). De Kauffmann was dismissed and Berlin stormed, but the minister was convinced he had acted for the best interests of his king and his people, and he stayed on in Washington. On July 7 the United States announced military occupation of Iceland (*q.v.*), but that action caused no legal change with respect to Denmark.

Danish resentment of the nazis showed itself mostly in a hostile correctness of attitude, and in refusal to associate with the Germans except in necessary business dealings. On Waldemar's day in June, R.A.F. flyers dropped leaflets encouraging patriotic hopes. A Danish council in London worked for the day of liberation, as did a group organized as "Free Denmark" in the United States. A unit of Danish soldiers fought with the British, and 5,000 seamen helped keep the life lines of the sea open.

Education.—In 1940 there were 407,355 students in the elementary schools and 67,064 in the middle and secondary schools. In the two Danish universities 6,474 students were enrolled. The entire budget of the ministry of education (including expenses for museums, libraries, etc.) provided 86,160,000 kr. for 1941–42.

Defense.—Budgets for purely military expenses were as follows: 1938–39, 33,635,000 kr.; 1939–40, 84,494,000 kr.; 1940–41, 62,663,000 kr.; 1941–42, (est.) 28,855,000 kr.

Finance.—The monetary unit is the kron (=20.346 U.S. cents in 1939). Government revenues in 1939–40 were 647,987,000 kr.; (est. 1940–41, 853,262,000 kr.); government expenditures in 1939–40 were 638,703,000 kr.; (est. 1940–41, 845,039,000 kr.). The national debt on Dec. 31, 1940, was 1,337,755,000 kr. Bank deposits were 1,541,200,000 kr. in 1939, and total bank funds were 3,362,000,000 kr.

Trade.—In 1940, exports amounted to 1,517,362,000 kr.; imports were valued at 1,376,836,000 kr. The chief articles of export were dairy products, eggs, poultry (485,498,000 kr.); meat and meat products (362,682,000 kr.); and live animals (chiefly for slaughter) (288,557,000 kr.; up spectacularly from 88,085,000 kr. in 1939, as the other chief items were about 15% down). Chief articles of import were coal, electricity, oil, etc.; foodstuffs, iron and steel, paper, grain and fertilizers. In 1939 exports went chiefly to the United Kingdom and Germany; imports were also supplied principally by these two countries. In 1940 and 1941 the overseas countries dropped out of Danish trade, but exact statistics by country were lacking.

Communication.—In 1940 there were 2,998 miles of railroads, carrying 64,244,000 passengers, and 9,056,497 tons of freight; 4,874 miles of improved and 20,870 miles of unimproved highways. By April 1, 1941, the number of automobiles had declined to about 32,000 and of motorcycles to 82. National airways carried 29,867 passengers in 1940. There were 390,065 subscribers to telephones in 1940–41, and 792,118 licensed radio listeners in March of that year.

Agriculture.—The area cultivated in 1940 was 8,045,000 acres. Leading crops and production (1939, in short tons) were as follows: barley (1,376,662); fodder (27,322,269); oats (1,114,315); potatoes (1,348,995). Livestock in June 1940 included the following: cattle, 3,279,300; pigs, 3,269,400; horses, 574,700; poultry, 33,296,200 (1939); sheep, 147,100.

Manufacturing.—The total value of production in 1939 was 3,719,329,000 kr. Chief manufactures were foodstuffs (1,002,363,000 kr.); transportation (ships, etc., 424,865,000 kr.); chemicals (368,509,000 kr.); wood and paper (264,170,000 kr.); clothing (230,994,000 kr.); metals (224,221,000 kr.); textiles (218,332,000 kr.). There were 178,425 employed workers in 6,320 establishments. The wholesale price index (based on 1935=100) rose rapidly from 118 in 1939 to a high of 207 in Aug. 1941.

(F. D. S.)

Dentistry. Figures released by government officials in 1941 showed that dental ailments headed a list of physical and mental defects leading to the rejection of men for military service. While 10% were turned down because of educational deficiencies, 20.9% or 188,000 cases, were rejected because of dental neglect.

Dental caries, the starting point of most of the dental ills, in the light of these figures again loomed large as a problem of major importance in public health. In the New England states there was improvement.

Reissner attacked the problem of dental caries from a systemic point of view and developed the organotherapeutic approach to its treatment.

Barrett approached the problem from an entirely new point of view: He related dental caries to the science of semantics. In his paper on "Semantogenesis and the Control of Dental Caries" his general thesis is that if dental caries and the management of the carious patient are approached from the standpoint of semantics, dental caries can be controlled.

One prominent theory regarding tooth decay is that it comes from the rapid growth and activity of the lacto bacillus in the mouth. The amount of activity has been determined, in part, by bacteriological counts. Marshall Snyder devised "a simple calorimetric method for the diagnosis of caries activity." He maintained that this simple calorimetric test, based on acid production in a selective carbohydrate medium (pH5.0) can be used as a means of diagnosing caries activity. In a group of 63 young people it was possible to select very accurately the caries active and caries negative cases, as established by clinical examination.

Fosdick and Starke, who have studied the matter of carbohydrate degradation by mouth organisms, felt that other factors entered into the problem besides the lacto bacillus, and made the statement that "On the basis of theoretical speculation, it is suggested that the presence of other organisms, in conjunction with yeast and the L. acidophilus, may augment the rate of decalcification of tooth enamel."

The role of calcium and phosphorus in developing sound tooth structure, and also maintaining it, has been a matter of considerable study. Becks and Furuta studied the effects of magnesium deficiency diets on oral and dental tissues and believed that "It can be generally concluded that magnesium is an essential mineral for enamel formation in rats, and that its lack represents another important factor to be considered in disturbances of enamel formation." Evidence has been accumulating for a number of years that the role of nutrition plays an important part in this whole matter of healthy dental structures and that deficiencies of various kinds are responsible for some of the dental disturbances. The dental effects experimentally produced by Howe, Bessey and White have been brought about chiefly by deficiencies in the organic elements calcium and phosphorus and the vitamins A, C and D. In vitamin C deficiency they found the bones and teeth markedly affected, and they outlined a desirable basis for daily food for the preschool child, through the adolescent period, for the adult and for pregnant women and nursing mothers. These authors believe that "In the mouth is the handwriting of individual physiologic activities. We can interpret comparatively little of what is written. Nevertheless, oral diagnosis has had a beginning, and little by little we are adding to our store of knowledge. The next step in dentistry is to open the portfolio of the facts relating systemic to oral states."

In May the president of the United States called the first National Nutrition Conference for Defense. In connection with this conference a subcommittee of the National Research council submitted a compilation of recommended allowances for special nutrients.

Dr. Lydia Roberts, a member of the Council on Foods and Nutrition, translated the daily food allowances, expressed in laboratory terms, as follows: "One pint of milk for an adult and more for a child; a serving of meat, and cheaper cuts are just as nutritious; one egg, or some suitable substitute such as navy beans; two vegetables, one of which should be green or yellow; two fruits, one of which should be rich in vitamin C, found abundantly in citrus fruits and tomatoes; breads, flour and cereal, most or preferably all whole grain or enriched; some butter or oleomargarine with vitamin A added; other foods to satisfy the appetite." A child or an adult on this regime should have protection against rampant dental caries.

With the lack of exact knowledge regarding the cause and cure of caries, one must be content with what is called control, and in areas like New York city and Hawaii where there are fine dental programs, the incidence of dental caries has been cut down in extraordinary percentages. Savage stated that "A remarkable degree of control of caries may be obtained by the practical application of certain broad principles which, somewhere between them, seem to contain the secrecy of its aetiology. These principles are, first, the consumption of a diet physiologically well balanced and accompanied by the reduction of its refined carbohydrate content, and, second, the cleansing of the teeth by natural or artificial methods." To this statement should be added that early attention, by the dentist, to breaks in the enamel surfaces, and the prompt filling of small cavities are also important parts of the control program.

The large amount of dental disease existing in the United States, as evidenced by the percentage of rejections for dental defects, has been claimed to be due in part to economic reasons—the inability of large groups of people to pay for the right kind of food and inability to pay for dental service. The economics committee of the American Dental association published in 1941 "A Study of the Dental Needs of Adults in the United States." This was a complete study of the whole problem. The average cost of dental care, based on the application of the fee schedule of the United States veterans administration to the average dental needs, was found to be $48.96 for males 15 years of age and over, and $45.43 for females in the same age range. Analysis of the effects of regularity in visiting the dentist, based in this study on the length of time elapsing since last visiting the dentist, revealed a definite relationship between length of time and the average dental need. The report stated, "This study positively demonstrates that with adequate dental care, including both daily dental hygiene and regular visits to the dentist, the dental health of the nation can be raised to a much higher level. Improvement of dental health on a national scale can and must be brought about by a vigorous and continuous program for dental care and dental education."

A book published in 1941 by Saunders, *Dental Education in the United States* by John T. O'Rourke and Leroy M. S. Miner, brings together in one volume the historical background of modern dental education, its aims and objectives and the needs for modification of the dental curriculum. The book also deals with some of the social aspects of dental service and its relation to dental education.

Dentz, Henri (1881–), French army officer, was born Dec. 12 in Roanne, France. He entered St. Cyr military academy at the age of 19, completing the course as no. 1 man in his class, and became a lieutenant in a Zouave regiment. He graduated from the Ecole de Guerre in 1910 as a general staff officer. Cited three times in World War I, he was promoted to the rank of major and after the armistice, he served in occupation posts in Mainz, Germany, and at Constantinople (Istanbul). He was then sent to Syria, where he won recognition for his services as the head of the intelligence department. He was made a colonel in 1927, promoted to brigadier general in 1934, and was given command of an army corps in 1939. In Dec. 1940, he was made high commissioner of Syria and Lebanon by the Vichy government and was placed under direct orders of General Maxime Weygand (*q.v.*). On June 8, 1941, British near east armies invaded Syria after Vichy had rejected British demands to oust axis agents there. General Dentz's French armies resisted the British drive, but they were cut off from supplies by the British fleet. Dentz's position soon became hopeless and he concluded an armistice July 12, 1941. Interned Aug. 8, 1941, by the British on a charge of violating the armistice agreement, he was released in Sept. 1941 in an exchange of prisoners.

Dermatology. An outstanding contribution was made by Peck, Chargin and Sobotka showing that keratosis follicularis (Darier) is due to deficiency in vitamin A. Four patients, while on a normal vitamin A-containing diet, showed a decided decrease in the vitamin A content of the blood serum. The carotene content of the blood was normal. Vitamin A in doses of 200,000 U.S.P. units was given by mouth daily to three patients, and was followed by gradual disappearance of the eruption. There was a coincidental restoration of vitamin A content of blood serum to normal levels. The authors suggested that the disease was possibly a physiologic nevus with an hereditary weakness in vitamin A absorption or in conversion of provitamin A to vitamin A.

In a spectrographic study of patients with chronic disseminated neurodermatitis, MacCardle, Engman Jr. and Engman Sr. found a decided decrease in magnesium in every active lesion and in every area of unaffected skin. No reduction of magnesium was apparent in 13 other cutaneous diseases. The same authors made an extensive study of the histologic structure of the skin in 33 cases of chronic disseminated neurodermatitis and compared it with that of normal persons of similar age and patients with other cutaneous diseases. Although the structure could not be considered an anatomical entity, sections were easily distinguished from 13 examples of psoriasis and 8 of contact dermatitis.

In discussing the poison ivy plant and its oleoresin, Shelmire said that the three forms of rhus with three leaflets and white berries, when grown under similar conditions, indicate that poison ivy in North America is represented by a single polymorphic species, with certain variations according to habitat. The irritative properties of the fresh saps and the ether extracted oleoresin of the various so-called species of poison ivy and poison sumac are biologically identical.

Osborne, Jordan and Campbell, in a report of 100 cases, found nail lacquer to be the most common cause of dermatitis about the eyelids of women. They said it should be considered a possible cause of dermatitis of the face, neck, cheeks, ears, ear canals, shoulders, chest and lips. Less common sites were the thighs, arms, axilla, anogenital area and legs and the general surface of the body. The eruption was usually of a patchy erythematosquamous type. Patch tests were found to be of doubtful value.

Histologic studies of the uninvolved skin in psoriasis were reported by Madden. Three hundred biopsies from 77 patients were studied. Characteristic changes of psoriasis were found in uninvolved skin at sites of election for psoriasis. This indicated that the skin as a whole took part in the disease. Typical histologic changes were also found in a pigmented residue of a lesion which had been healed for more than three months. The author thought that this might account for the necessity at times of treating psoriasis long after clinical lesions had disappeared.

Balanitis xerotica obliterans, a disease little known in the United States, was discussed by Freeman and Laymon on a basis of a study of 18 cases. They concluded that it may occur at any age in adults and that its development does not depend on previous operations on the genitalia. The authors concluded that the disease was identical with kraurosis penis and that it was at least closely allied to lichen sclerosus et atrophicus.

Jamieson and McCrea studied reinfection of ringworm of the feet from shoes and slippers. Positive cultures of scrapings from shoes of persons with ringworm of the feet showed that footwear may harbour pathogenic fungi and cause reinfection in many persons and primary infection in others. Detroit. Fourth largest city of the U.S.A., in Wayne county, southeastern Michigan, on the Detroit river; the metropolis of the state. Area, 137·9 sq.mi.; population (1940), 1,623,452. Foreign-born, about 400,000. Canadian and British predominated, greatly exceeding in numbers the Polish group, which was second in size. Assessed value, $2,525,250,760; gross bonded debt as of Dec. 31, 1941, $354,068,239, which included $96,325,739 of self-supporting utility debt; gross city appropriation, $143,223,158, including utilities; tax levy, $68,977,224; tax rate for city and school purposes, $27.32. Mayor (Jan. 1, 1942), Edward J. Jeffries, Jr.

A highly industrialized city, Detroit was keenly affected by the curtailment of automobile production and the speed-up of defense activities in 1941. The forepart of the year was characterized by a "boom" in automobile manufacturing, pay increases and shortage of housing facilities. The complete elimination of automobile production for private purposes was in part offset by new defense industries and some manufacturing for the war department, but during the period of transition to complete war production the city suffered substantial unemployment.

The initial upsurge in industry was disturbed by numerous minor unauthorized strikes and by a major strike in the Ford plant. The company had refused to enter into any contract with the C.I.O. but eventually reversed its position completely and granted the union shop and "check-off."

Other important labour difficulties developed in the city government which culminated in a brief jurisdictional strike in the municipally owned street railways. Following an election, the A.F. of L. union was in substance granted a contract and sole bargaining rights. Threatened strikes among other municipal employees were cancelled as a result of the declaration of war, but demands for wage increases continued.

The local governments, both city and county, provided major political scandals during the year. As the result of revelations incident to a minor police case, a grand jury brought graft indictments against a former mayor, and then the incumbent prosecutor, sheriff and numerous police officials. The three former were convicted with 22 police officers. The jury then turned its attention to the city council, and three councilmen were convicted of bribery in connection with federal housing projects.

In spite of public indignation at graft charges and convictions, the city government, under a new executive, operated effectively. The refunding of the public debt, with substantial savings in interest, continued, budget limitations were observed and the deficit was reduced. (L. D. U.)

Devaney, John Patrick (1883–1941), U.S. jurist, was born June 30 in Lake Mills, Ia. One-time leader in the Democratic party in Minnesota, Devaney was a friend and political adviser of the late Floyd B. Olson, Farmer-Laborite governor from 1931 to 1936. Devaney was chief justice of the Minnesota supreme court, 1933–37, and was chairman of the Minnesota Crime commission, 1934-41. In 1940, he was appointed by President Roosevelt to the Emergency Board in Settlement of Labor Disputes. Devaney died in Milwaukee, Sept. 21.

Diabetes. Diabetes ranked eighth as a cause of death in the United States in 1940, 35,015 cases, 26·6 per 100,000, the highest mortality yet attained. Under the age of 25 there were 975 deaths and 805 above the age of 85. Most of the deaths occurred between the ages of 65 and 69, which is five years less than the peak period for all deaths. In New York city the rate was 41·6. Diabetic coma, once the leading cause of death in diabetes, dropped to 3·6% of 929 fatal cases in one clinic which also reported no deaths in the treatment of 43 successive instances of actual coma.

The use of insulin has increased yearly since 1923. The addition of protamine in 1936 doubled the duration of its action to 12 or 14 hr and the subsequent insertion of zinc lengthened its effect to between 24 and 48 hr., which quite likely accounts for the recent prolongation of life of diabetics. Although protamine zinc insulin is satisfactory alone for one-half of all diabetics, its initial slowness of action and delay in lowering the blood sugar make it advisable to supplement it with the original regular or the similar but purer crystalline insulin, which act immediately. To obviate two injections, several new insulins were devised which combine the properties of regular and protamine zinc insulin. They did not, however, up to the close of 1941, appear to be enough superior to the older insulins to warrant cumbering druggists' shelves and confusing patients' minds with their distribution. Two of these newer insulins are histone zinc insulin and globin zinc insulin. They act promptly and for about 24 hours. Histone is obtained from the thymus gland and globin from the red blood corpuscles.

The demonstration by the Toronto school that the experimental diabetes caused by the injection of an extract of the anterior pituitary gland into a dog can be prevented by the simultaneous injection of insulin or dietary modifications and by the Philadelphia investigators that the diabetes similarly produced in a cat can be similarly cured even after it has continued five months stimulated aggressive clinical attempts to prevent and cure human diabetes or at least halt its progress. Prevention was not proved and cures were not reported up to Jan. 1, 1942, but clinicians were constantly confronted with near-cures. These remarkable experiments with animals provoked a renaissance of orthodox diabetic therapy.

Monographs, manuals, state and city publications upon the disease appeared in growing numbers. An insurance company concentrated upon diabetes in its health advertising propaganda. Children's diabetic summer camps numbered 20 or more. The American Diabetes association, a counterpart of the English Diabetic association, was incorporated in 1941.

Experiments discredited concepts of the relation of fat metabolism to acidosis (ketogenesis). Hurtley's hypothesis of multiple alternate oxidation of the fatty acid chain replaced Knoop's theory of successive beta oxidation. These new concepts, together with related evidence in the literature, were admirably summarized by Stadie. "The diabetic who by reason of insulin lack is unable to utilize carbohydrates to the full measure of his metabolic needs must fall back on fat for his energy requirements. Part of this need is met by the initiation and completion of fat oxidation in the muscles themselves. However, a considerable fraction estimated as one-third to one-half of the total caloric needs from fat is obtained by a preliminary oxidation of fats in the liver to ketone bodies only. Neither acetic acid nor glucose is formed by this oxidation. These hepatic ketone bodies are freely utilized for energy by the periphery without insulin and without the necessity of simultaneous carbohydrate oxidation. This reserve mechanism, however, appears to be incapable of fine regulation so that when the demand for fat calories exceeds a certain level, approximately 2·5 gm. of fat/kg./day for the resting state,

ketone bodies in excess of needs are formed by the liver. The excess is excreted as ketones in the urine. If this excessive fat catabolism continues unchecked, ketosis and coma follow."

Lack of insulin is the primary but not the only hormonal abnormality in diabetes. In childhood one sees evidence of a complex disorder in the deviations of growth and development. Their acceleration characterizes juvenile diabetes at onset whereas retardation may characterize the disease when of long duration. These abnormalities are susceptible to appropriate endocrine therapy.

Another example is the abnormal hormonal pattern found in half the patients when pregnancy complicates diabetes. Progestin failure early in pregnancy is associated with spontaneous abortion, which destroys 20% of the foetuses. Progestin-oestrin failure with rise of chorionic-gonadotropin and probably other hormonal disturbances are associated with premature deliveries, toxaemia, stillbirth, and neonatal deaths. These accidents bring the deaths up to 50%.

Continuous progestin therapy apparently prevents the foetal wastage early in pregnancy.

Continuous oestrin and progestin substitutional therapy, when indicated, according to some authors, corrects the foetal wastage in the later part of pregnancy so that the diabetic foetal mortality is not more than 10% compared with 5% for nondiabetics.

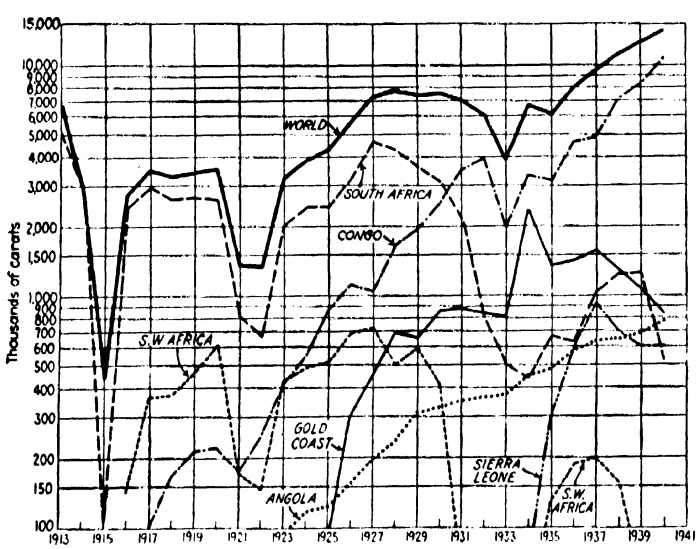
Diamonds. World production of diamonds during recent years is shown in an accompanying chart. Few actual figures were reported for 1940, and the estimates used in the chart are those of S. H. Ball, in *Minerals Yearbook*.

The main feature of the year was the large increase in output from the Belgian Congo, which produced three-quarters of the 1940 output on a weight basis, though much less on a value basis, as the larger portion of the Congo stones are of industrial grade.

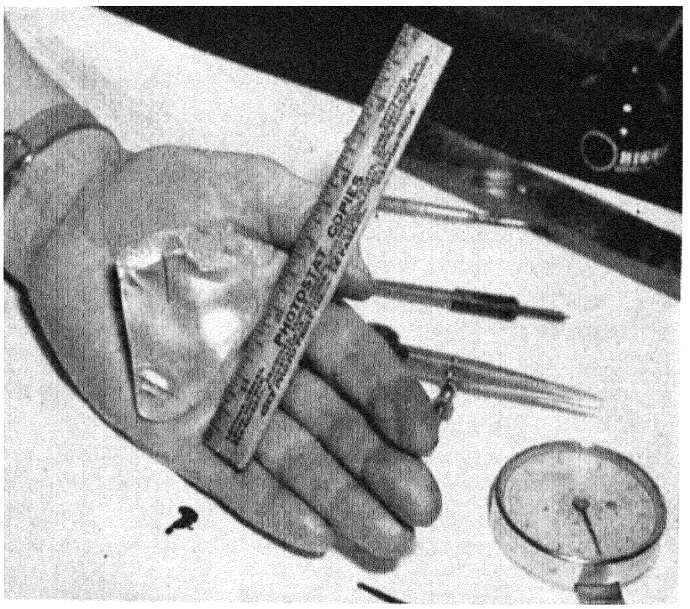
Production in South Africa and South-West Africa is predominantly gem stones, and for this reason work has been curtailed; in South Africa mine operation was discontinued in Sept. 1940, but alluvial work there and in South-West Africa was continued on a reduced scale.

In other areas, especially where industrial stones predominate, production is being pushed.

During World War I diamonds were considered primarily a luxury product and output was greatly restricted, but in World War II the larger portion of the output by weight, though not by value, was a highly important industrial raw material, especially useful in munitions manufacture and automotive work, and demand increased accordingly.



DIAMOND PRODUCTION OF THE WORLD and the major producing countries *(The Mineral Industry)*



THE PRESIDENTE VARGAS DIAMOND, third largest ever discovered, as it appeared before cutting operations began in New York city April 9, 1941, after a year of study by diamond experts

With the German occupation of Belgium and the Netherlands, the two chief diamond cutting centres of the world, Antwerp and Amsterdam, fell into German hands, but most of the accumulated stocks of cut and rough stones had previously been removed to safety in England or the United States. For a time the cutting industry was in a state of collapse, but later it was reorganized under German control, and was operating on a reduced scale, since there was no adequate supply of rough stones available except from British territory.

Imports of diamonds into the United States increased in 1940, but the character of the imports changed radically from that of preceding years.

Cut stones have been less available since the European cutting industry collapsed, and more rough was imported, to be cut in the establishments already in operation, and in new ones that were being started by refugees from cutting centres of Europe.

Imports of rough stones increased 48% over 1939 to 227,900 carats, while cut stones dropped 34% to 321,500 carats. Imports of industrial stones were already exceptionally heavy in 1939, and increased only 7% to 3,810,900 carats. Imports increased still more in 1941, the total for the first eight months being 2,647,400 carats, or at a rate of 3,971,100 carats for the year, although the rates for both rough and cut stones decreased. (G. A. Ro.)

Diatomite. World production of diatomite is estimated to be of the order of 300,000 long tons, of which the United States contributes somewhat more than one-third.

The output of Denmark has been almost as large as that of the United States, and the remaining third of the total has been furnished by a long list of small producers, of which only Japan, Algeria, France and probably Germany have outputs in excess of 10,000 tons. (G. A. Ro.)

Dietetics. Nutrition trends indicated official interest in nutrition in many countries, whether it was the daily ration of less than 1,250 calories in France, the committee to supervise the provision of the country with vitamins in Sweden, the establishment of a department of nutrition in Mendoza, Argentina, the organization of a national program for adequate nutrition in Britain, or the recommended dietary allowances of the National Research council of the United States.

Research continued on many phases of the nutrition problem. Some new techniques increased understanding of vitamin A. Through fluorescent microscopy Popper found it in human tissues, tracing its absorption and path in the body.

While chiefly concentrated in the liver, significant amounts are found in other organs, even in the body fat of well nourished adults. Dark adaptation studies showed marked differences between English and French school children in Quebec, as reported by Goss.

Other eye defects responding to vitamin A, observed by Kruse, were Bitots spots, conjunctival changes, photophobia, lachrymation. Sandels found follicular conjunctivitis in groups of Florida school children to be their expression of vitamin A deficiency.

Since whole grain cereals and dried beans are rich sources of thiamin, evidence of its retention in cooking is welcome.

A maximum of 9% was destroyed when cereal was boiled five minutes over a direct flame followed by one hour in the double boiler. Somewhat less vitamin B_1 was found in baked than in boiled beans.

In spite of the discovery of the food deficiency responsible, pellagra continued to develop due to ignorance usually reinforced by the deprivations of poverty or war. Sydenstricker emphasized the aetiologic effect of high carbohydrate diets, reduced availability of nicotinic acid in the absence of gastric acid, and of failure of liver function under conditions of metabolic strain.

Ocular manifestations of human riboflavin deficiency reported in the United States were confirmed by Hou in China. Hou observed and treated 40 cases in three months, and while some cases also had cheilosis, the two sets of symptoms were not always found in the same patient.

Dietary "Pattern" to Meet the Recommended Allowances

Milk, adults 1 pt., children 1½ pt. to 1 qt.
Egg, 3 or 4 times per week.
Meat, 1 serving (1 oz. at 1 yr. up to 3 oz. for adults).
Vegetables, 2 servings. One green or yellow.
Fruit, 2 servings. One citrus or tomato and one other, as apple, prunes, etc.
Potato, one or more servings.
Butter or fortified oleo (100–500 calories).
Whole grain or "enriched" cereal and bread, at least half of the intake.
Sugar, fat, etc., to complete calories.

It was generally agreed that humans require pyridoxin (B_6). Its low toxicity facilitates its continued experimental use. Animal products, especially muscle meat, are usually good sources of this vitamin. Wheat germ is an equally rich plant source.

As the result of analysis, Sweany reported that humans saturated with vitamin C contain 5 mg. per 100 g. or 3–5 g. total. Active, severe tuberculosis cases contained less than 10% of this. Aged persons also usually had a low reserve. (*See* also VITAMINS.)

Dimension Stone: *see* STONE.

Dinsmore, Charles Allen (1860–1941), U.S. educator and clergyman, was born Aug. 4 in New York city. He graduated from Dartmouth college in 1884 and received a D.D. degree from Dartmouth in 1905 and a similar degree from Yale in 1916. In 1888 he was ordained in the Congregational Church and thereafter served in a number of New England pastorates.

In 1920 Dr. Dinsmore became lecturer on the spiritual content of literature at Yale Divinity school with the rank of professor. He was the author of biographical and critical works on Dante, among which were *The Teachings of Dante* (1901), *Aid to the Study of Dante* (1903) and *Life of Dante* (1919). In later years he wrote *The English Bible as Literature* (1931) and *The Great Poets and the Meaning of Life* (1937). Dr. Dinsmore died at New Haven, Conn., Aug. 14.

Recommended Daily Allowances for Specific Nutrients*

	Calories	Protein, grams	Calcium, grams	Iron, mg.	Vitamin A,‡ I.U.	Thiamin (B_1), mg.†	Riboflavin, mg.	Nicotinic acid, mg.	Ascorbic acid, mg.†	Vitamin D, I.U.

Source: Committee on Foods and Nutrition, National Research Council.
*Tentative goal toward which to aim in planning practical dietaries; can be met by a good diet of natural foods. Such a diet will also provide other minerals and vitamins, the requirements for which are less well known.
**Allowances are based on needs for the middle year in each group (as 2, 5, 8, etc.), and for moderate activity.
†1 mg. thiamin equals 333 I.U.; 1 mg. ascorbic acid equals 20 I.U.
‡Requirements may be less if provided as vitamin A; greater if provided chiefly as the provitamin carotene.
§Needs of infants increase from month to month. The amounts given are for approximately 6–8 months. The amounts of protein and calcium needed are less if derived from breast milk.
¶Vitamin D is undoubtedly necessary for older children and adults. When not available from sunshine, it should be provided probably up to the minimum amounts recommended for infants.

Diplomatic Services: *see* AMBASSADORS AND ENVOYS.

Disasters.

During 1941 loss of life and property in accidents and disasters included the following:

Aviation

Jan. 4 — Near San Diego, Calif. Entire crew of 11 in navy transport plane killed in crash on Mother Grundy peak; victims included 4 men who had parachuted from another navy plane in distress Jan. 2.

Jan. 16(?) — Near Morton, Wash. Army bomber crashed into hillside; 7 killed.

Jan. 23 — St. Louis, Mo. Airliner crashed near municipal airport; pilot and another killed; 12 injured.

Feb. 6 — Kwangtung province, China. Admiral Osumi and 6 other Japanese naval officers killed when their plane crashed on Huanyangshan mountain near the Si-kiang river.

Feb. 6 — Near Lovelock, Nev. U.S. army bomber smashed into Ragged Top mountain, killing crew of 8.

Feb. 6 — Near Armstrong, Ont. Nine passengers and crew of 3 killed when Canadian passenger plane crashed a mile from Armstrong airport.

Feb. 22 — Near Musgrave Harbor, Newfoundland. Sir Frederick Grant Banting, co-discoverer of insulin, and 2 other men killed when plane crashed in snow wastes; pilot survived crash.

Feb. 27 — Near Atlanta, Ga. Seven killed, 9 injured in crash of passenger airliner; Capt. Eddie Rickenbacker was injured.

March 17 — Pacific ocean. Six U.S. navy fliers killed when 2 planes manoeuvring in Pacific area crashed in mid-air.

March 28 — Cape province, Union of South Africa. Plane crash killed 10, including British admiral.

April 8 — Machipongo inlet, near Virginia coast. U.S. navy patrol bomber crashed and sank; 10 aboard killed.

April 16 — Near San Diego, Calif. Three navy fliers killed when torpedo bomber crashed into sea.

May 16 — Near Nelsonville, Ohio. Five occupants of a twin-motored army bomber were killed when the plane crashed during a storm.

May 19 — Rains, S.C. Four army fliers were killed when 2 army bombers collided in mid-air.

June 2 — San Diego bay, Calif. Four U.S. airmen were killed when a 4-motored bomber crashed into San Diego bay.

June 10 — Near Lyman, Wyo. U.S. army bomber, missing for 4 days, found wrecked on plain; 6 army pilots were killed.

June 11 — El Valle mountains, near Balboa, Canal Zone. U.S. army bomber crashed 70 mi. southwest of Panama City, killing 4 occupants.

June 24 — Mount Haleakala, Maui island, Hawaii. Three U.S. Marine fliers killed when their plane crashed on a mountain slope.

June 25 — Near Lima, Peru. U.S. bomber crashed into the Pacific, killing 3 occupants.

July 24 — Cardington, Ohio. U.S. army bomber destined for shipment to Britain crashed, killing both the pilot and co-pilot.

Aug. 1 — Near Fort Ord, Calif. Three army pilots were killed when 2 military planes locked wings in mid air.

Aug. 14 — England. Twenty-two were killed, among them 11 American ferry pilots, when a ferry plane crashed at an unnamed airport; Arthur B. Purvis, chairman of the British supply council in North America, was among the dead.

Aug. 18 — Near São Paulo, Brazil. Eight were killed and 5 were injured when a Brazilian transport plane crashed on a mountain peak near São Paulo.

Aug. 19 — Florida. Seven naval aviators based at various training schools in Florida were killed in a series of 4 separate plane wrecks over a 24-hour period.

Aug. 29 — Near March field, Calif. Four army pilots were killed when 2 army planes locked wings in a practice flight.

Sept. 1 — United Kingdom. Ten were killed when a transatlantic ferry transport plane crashed on the west coast.

Sept. 2 — Hempstead, L.I. Three children were killed when a plane that caught fire in mid-air plummeted into their midst. The pilot who bailed out suffered slight burns.

Oct. 2 — Near Flagstaff, Ariz. All 6 occupants of an army bomber killed when plane crashed into Mt. Agassiz.

Oct. 12 — Near Beaumont, Calif. Five army men killed when bomber crashed during rainstorm in San Gorgonio pass.

Oct. 13 — Batavia, Netherlands Indies. Lt. Gen. Berenschot, commander of Dutch East Indies army, and 11 others killed in a plane crash.

Oct. 21 — Near Balboa, Canal Zone. Three U.S. air force officers, each piloting a plane in a squadron flight, were killed when their planes crashed into a mountain.

Oct. 24 — Near Hamilton field, Calif. Five army pilots died when their twin-motored bomber crashed on mountain peak.

Oct. 28 — Near Vaughn, N.M. Five army fliers killed when their trainer plane crashed.

Oct. 30 — St. Thomas, Ont., Can. New York-Chicago airliner crashed in flames, killing all 20 occupants.

Oct. 30 — Near Fargo, N.D. Fourteen died when airliner crashed in a fog near Fargo airport; pilot was only survivor.

Nov. 1 — Near Findlay, Ohio. Five killed when army bomber crashed into a cornfield.

Nov. 3 — Atlantic ocean. All 12 occupants of a U.S. navy bomber killed when plane crashed in Atlantic while on patrol duty.

Nov. 12 — Near Nimes, France. Gen. Charles Huntziger and 7 others returning from North Africa killed when their plane crashed.

Dec. 13 — Balboa, Canal Zone. Five killed and 10 injured when army bomber crashed into barracks.

Fires and Explosions

Jan. 14 — Brooklyn, N.Y. Six men killed, 10 injured, in fire which destroyed box factory.

Feb. 4 — New Haven, Conn. Fire destroyed plant making army blankets; 10 workers killed, 3 injured.

Feb. 8 — Dallas, Tex. Ten homeless transients killed when flames destroyed Salvation Army refuge.

Feb. 11 — Chicago, Ill. Giant pressure drum exploded in chemical plant near "Loop," killing 3 employees and injuring 6.

Feb. 14 — Near Du Quoin, Ill. Seven men were killed in blast at liquid oxygen plant of coal mine.

March 10 — Brockton, Mass. Twelve firemen killed in collapse of roof of burning theatre.

March 14 — Seville, Spain. Fifteen killed, 300 injured and 3,000 left homeless when powder plant blew up.

April 11 — Belvidere, N.J. Powder plant blast killed 2, injured 3.

April 20 — Eastern U.S. Forest fires swept over drought-stricken areas in N.Y., N.J., Md., Mass., W.Va., and Pa., destroying many homes and woodlands.

May 15 — Philadelphia, Pa. A $2,000,000 blaze destroyed a lumberyard damaged a shipyard building and razed a number of dwellings; 2 were killed.

May 23 — Sewaren, N.J. Explosion of a gasoline tank in an oil plant caused the death of 5 workmen.

May 31 — Jersey City, N.J. Waterfront fire destroyed $25,000,000 in defense materials and razed grain elevators and nearby stockyards.

June 5–6 — Smederevo, Yugoslavia. At least 1,500 persons were killed and 2,000 seriously injured when an ammunition dump exploded in the Smederevo fort, near Belgrade, a Berne dispatch said.

June 30 — Near Indiana, Pa. Blast in coal pit killed 6 miners and injured 21 others.

Aug. 10 — Near Doylestown, Pa. Five children perished in a blaze that destroyed an ancient highway tollhouse in which they lived with their parents.

Aug. 14 — Japonski island, Alaska. Five were killed in an avalanche of rock loosened by blasting at a construction camp.

Aug. 18 — Brooklyn, N.Y. A fire that started on a Brooklyn pier and wrecked the freighter "Panuco" took a toll of 31 dead.

Aug. 18 — Near Grange, Pa. Six children died in a blaze that destroyed the home of a WPA worker.

Sept. 24 — Whiting, Ind. Fire which started in naphtha plant of large refinery destroyed several buildings and tanks; one person was killed and five were injured.

Oct. 11–12 — Fall River, Mass. A 14 hr. fire swept through 4 buildings of large rubber plant, causing damage estimated at $12,000,000; no deaths were reported.

Oct. 12 — Sitka, Alaska. Six U.S. soldiers killed by blast in underground dynamite magazine at Sitka naval air base.

Oct. 27 — Nortonville, Ky. Fifteen men trapped in a coal mine explosion were found dead.

Oct. 28 — Montclair, N.J. Twelve Negroes were burned to death when fire swept through a flimsy house.

Oct. 31 — Huddersfield, Yorkshire, England. Forty one died in fire at clothing factory.

Oct. 31 — Nordegg, Alberta, Can. Twenty-seven miners were killed by a blast in a colliery

Nov. 24 — Seward, Alaska. Fire destroyed half of Seward's business district and left 400 persons homeless, damage estimated at $1,000,000.

Dec. 12 — Burlington, Iowa. Nine workmen killed and 20 injured in blast which destroyed TNT melting unit in ordnance plant.

Dec. 16 — Schenectady, N.Y. Eight aged persons burned to death in convalescent home.

Dec. 28 — Harco, Ill. Seven men were killed in coal mine blast.

Marine

Jan. 21 — Off Boston, Mass. Fishing boat sank in shallow water after collision near Boston harbour; 19 were drowned, most of them after clinging 3 hours to protruding mast.

March 25 — About 80 mi. south of Cape Lookout, N.C. Explosion followed by fire on 9,000-ton oil tanker, "Cities Service Denver," cost lives of 20 seamen.

March 26 — Off Halifax, Nova Scotia. Canadian navy patrol vessel destroyed by fire at sea; 19 seamen were drowned or died of exposure.

May 18 — Near Little River, S.C. Explosion aboard the excursion boat "Nightingale" killed 7 passengers and injured 14; the blast occurred as the boat was 12 mi. out.

June 20 — Near Portsmouth, N.H. U.S. navy submarine "O-9" failed to come up from a 402-ft. test dive; crew of 33 was lost.

June 20 — Near Bailey island, Me. Thirty-six died when a cabin cruiser exploded.

Sept. 17 — Near Stockholm, Sweden. Three Swedish destroyers were blown up in a mysterious blast in Haorsfjaerdens naval yard; 31 sailors were killed and 12 were injured.

Motor Traffic

Jan. 26 — Dalton, Ga. Six killed when their motor car was hit by train.

Aug. 10 — Near Waynesville, Mo. Eight Negro soldiers were killed and 6 were injured when army truck burst into flames following a crash with a civilian truck.

Aug. 24 — Near Waldwick, N.J. Eight were killed and 15 were injured when a bus crashed into a line of motor cars waiting at a traffic light.

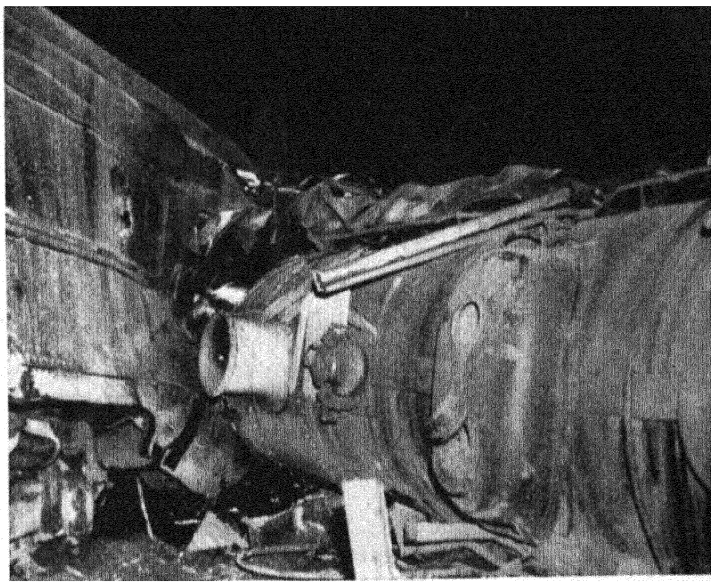
Sept. 13 — Highland, Ind. Seven in one family were killed when their car was struck by an express train.

Oct. 26 — Near Clanton, Ala. Fifteen were burned to death when a bus crashed into concrete bridge and burst into flames.

Nov. 15 — Near Rushville, Ind. Nine burned to death and 10 others injured when passenger bus plunged over a 25-ft. embankment and burst into flames.

Dec. 5 — Americus, Ga. Head-on collision between school bus and automobile caused death of 7 and injuries to 12 others.

Dec. 25 — St. Louis, Mo. Ten died and 22 were injured when bus collided with automobile and caught fire.



Above, left: MORE THAN 1,000 FAMILIES of Salina, Kan., were homeless in Oct. 1941 when the flooded Smoky Hill river overflowed into the residential section of the city

Above, right: THE WORST U.S. TRAIN ACCIDENT of 1941 took the lives of 12 persons on the night of November 9, when a Chicago-New York express train struck a cylinder-head blown off the locomotive of a passing freight train and crashed into a signal tower at Dunkirk, Ohio. The picture shows the train's locomotive smashed into one of the coaches

Below: SPARKS CARRIED BY WIND from burning swampland set fire to 325 cottages in the Ocean Bluff section of Marshfield, Mass. April 21, 1941 and destroyed them within three hours

Motor Vehicle Accidents in U.S.A.—1941

Number of deaths (est.)	40,000
Number of deaths (1940)	34,501
Number of non-fatal injuries (est.)	1,400,000
Deaths per 100,000,000 vehicle miles	12.0

Natural Disasters

Feb. 16–18	Spain and Portugal. Violent hurricane lashed ports along Bay of Biscay and Atlantic coast, killing 145 persons and starting a fire in Santander which left 30,000 homeless.
Feb. 19	Yugoslavia. Floods in northern Bačka and Banat inundated 50,000 ac., ruined crops and left 1,000 peasants homeless.
March 1	Northern Greece. Earthquake rocked town of Larissa in Thessaly, leaving thousands homeless.
March 16	North Dakota and Minnesota. Blizzard, sweeping along at 85-m.p.h. pace, killed approximately 60 persons.
April 15	Colima, Mexico. Earthquake followed by tidal wave and eruption of Colima volcano brought death to at least 174 persons, injured 175 and caused heavy damage.
May 25	Ganges delta, India. Five thousand persons were reported drowned in a storm that struck a number of villages in the Barisal district.
June 5	Pennsylvania. Heavy floods in western Pennsylvania caused the death of 4.
June 8	Near Wichita, Kan. Tornado killed 8 on farms north of Wichita.
June 27	Luzon island, Philippines. At least 5 were killed in a typhoon.
July 22	Ashikaga, Shizuoka prefecture, Japan. A typhoon following a week of heavy rains caused the death of 35 persons and left 26,000 homeless in the region.
Sept. 22–24	Texas Gulf coast. Hurricane gales killed at least 3 and caused damage estimated in millions.
Oct. 6	Kansas City, Kan. Three were killed and 40 injured by tornado.
Oct. 7	Southeastern U.S. Tropical storm swept through Florida gulf coast and Georgia, causing 9 deaths and heavy destruction.
Oct. 26	Arkansas. Two tornadoes, 6 hours apart, killed 17 and injured scores more.
Dec. 13	Huaras, Peru. Landslide wiped out entire residential section; more than 500 died.

Railroads

March 16	Near Baden, Pa. Passenger train plunged into Ohio river, killing 5 and injuring 50.
March 18	Windham, Ohio. Freight train crashed into passenger train carrying 700 construction workers to jobs in arsenal, injuring 300.
April 28	Near Claypole, England. Six boys, including the 2 sons of former Belgian Premier Hubert Pierlot, were burned to death when trapped in a blazing railroad coach.
Sept. 23	Wichtrach, Switzerland. An express train plowed through waiting local train, killing at least 15 and injuring 50.
Oct. 7	Sault Ste. Marie, Mich. A lift bridge over St. Mary's Falls canal collapsed under weight of a freight train, blocking transit of ships carrying ore needed for defense; 2 trainmen drowned when the train plunged into the canal.
Nov. 2	Paris, France. Twenty killed and 48 injured when a passenger train and freight train crashed at entrance of Austerlitz station.
Nov. 9	Near Dunkirk, Ohio. Twelve were killed and 40 others injured when a Chicago-New York express jumped the rails and plowed into a control tower.
Nov. 19	Van Nuys, Calif. Locomotive burst into flames in Hasson tunnel; engineer, fireman and 3 other trainmen killed.

Miscellaneous

Aug. 5	Near Yuma, Ariz. Seven in a party of 9 died of heat and thirst when their motor car stalled on the Sondra desert road.
Dec. 4	Hartford, Conn. Collapse of span across Connecticut river at Hartford killed 8 workmen; 6 others were missing.

(*See* also ACCIDENTS.)

Disciples of Christ, a religious body having its chief strength in the United States and Canada, which received its initial impulse in 1809, dates its separate existence from 1830, and its nationally organized work from 1849. It is also well represented in Great Britain, Australia and many mission fields. Local churches are generally known as Christian churches or as Churches of Christ. The familiar designation, "Campbellite," derived from the name of the earliest leaders, Thomas and Alexander Campbell, is resented. The headquarters of the United Christian Missionary society and other promotional and educational agencies are at Indianapolis, Ind. The National Benevolent association has headquarters at St. Louis, Mo. The annual international convention (United States and Canada), usually held in October, met in May 1941, at St. Louis (H. B. McCormick, president). The 1942 convention is scheduled to meet Aug. 12 at Oakland, Calif. A North American convention, a mass assembly not related to the organized missionary agencies, has been held annually in recent years. Disciples of Christ co-operate in all interdenominational activities, are members of the federal council and are participating in the formation of the World Council of Churches. World membership, as of June 30, 1941, was 1,834,562 (gain for the year, 5,097); churches, 8,886 (loss 38). In the United States and Canada there were 1,671,966 members (gain 2,744); 8,012 churches (loss 58); ministers 7,580 (gain 79). Receipts of national and state missionary, benevolent and educational agencies reporting to the international convention were $4,259,026 (gain $214,376). Receipts for local church maintenance, $11,839,565 (gain $774,285). There were many independent missionary agencies not reporting.

Dog Racing. The sport of dog racing in the United States developed into a vast industry, embracing about forty race tracks, with an annual turnover of nearly $100,000,000. The big business aspect of the sleek greyhounds centred largely in two of twelve states, Massachusetts and Florida; in the former eight tracks account for nearly $10,000,000 a year in parimutuel play, and in the Miami area four tracks claim over $8,000,000. In Miami about 500 owners and trainers cared for 2,000 fleet-footed canines with a collective value of more than $1,000,000. The dogs were valued at from $50 to $1,000, some of the champions worth as much as $5,000. (J. B. P.)

Dog Shows: *see* SHOWS: *Dogs.*

Dominica: *see* WEST INDIES, BRITISH.

Dominican Republic, a West Indian republic occupying the eastern two-thirds of the island of Hispaniola. Area, 19,326 sq.mi.; pop. (1935 census) 1,479,417. Aside from 73,070 aliens, there were 13% white, 71% "mixed," 16% Negroes. Official estimate of population in 1940 was 1,656,219. Chief cities (1935 pop.): Ciudad Trujillo, the capital, formerly Santo Domingo, oldest European-founded city in America, (71,091); Santiago de los Caballeros (34,175); San Pedro de Macoris (18,617). The population, fourth densest in Latin America, was nearly five-sixths (82.2%) rural. President in 1941: Dr. Manuel de Jesús Troncoso de la Concha.

History.—Important in Dominican history during 1941 was conclusion of a treaty with the United States abrogating the latter's right to supervise Dominican customs (in effect since 1905). On April 1, the Dominican government formally took over the collection of customs. Further evidence of cordial relations with the United States was given in December by declarations of war against all the axis powers. The authorization, in March, of a $300,000 loan from the U.S. Export-Import bank, supplementing a $3,000,000 credit of Dec. 1940, and continued activities aiming at establishing a rubber industry in the Dominican Republic, were other signs of close co-operation with the U.S.

Development of European refugee settlements was advanced when ex-President Trujillo gave another 50,000 acres of land to the settlers, largely German Jews, at Sosua. Other colonies did not fare so well, however, as did Sosua. Of eight established for Spanish republican refugees, five failed and the other three were in a serious state because of a lack of funds.

Concurrent with announcement of a project to revise the Dominican constitution to provide a six-year term for the president, it was freely predicted that ex-President Trujillo would be a candidate in the May 1942 presidential elections.

Education.—In 1939, there were 848 primary, 11 secondary, 46 vocational and 17 adult night schools (enrolment 115,703).

Finance.—The monetary unit is the peso, equivalent to the U.S. dollar. In October a central bank (established with a capital of $1,000,000 sub-

scribed by the government) took over the five branches of the National City Bank of New York, and became depository for all government revenues. Private banking was left solely in the hands of two Canadian banks.

Foreign Trade.—In 1940 imports (chiefly foodstuffs and manufactured goods) totalled $10,511,403 (1939: $11,592,166), with the United States supplying 66.37% (1939: 59.19%), Japan 8.3% (9.6%), British India 5.21% (3.68%), Curaçao, 3.92% (2.62%), Great Britain 3.88% (3.11%), Canada 2.53% (1.2%). Exports valued at $18,330,000 (1939: $18,643,302) went chiefly to Great Britain, 34.5% (1939: 31.5%), United States, 24.7% (27.1%), Canada, 15.5% (0.2%), Eire, 7.2% (4.6%), France, 6.2% (11.9%), French Morocco, 4.1% (7.6%), Curaçao, 2.8% (2.5%), Puerto Rico 1.8% (1.2%). The leading exports were sugar products, 74.4% (1939: 65%), cacao 8.8% (10.8%) and coffee 4.2% (9.3%).

During the first quarter of 1941, 69% of imports were supplied by the United States (56% in 1940). Exports declined 27% in the first seven months. Concern over disposal of the 1941–42 sugar crop was dispelled when Great Britain contracted to take the entire crop at better than 1940 prices.

Communication.—External communication is by air, with frequent Pan American airways service, and by sea. There were approximately 3,000 mi. of main highway in the republic in 1941, of which some 900 were motor roads. In 1939 there were 2,816 motor vehicles operating. There were 268 km. of railway in 1941; in addition, sugar and other estates maintained 982 km. of railroad. (L. W. Be.; L. C. Dea.)

Donations and Bequests. More than $10,500,000,000 was contributed to philanthropic purposes by the United States public between the years 1922 and 1938, inclusive. Income tax data reported by the U.S. treasury department and the reports of philanthropic foundations yield these figures. Since many contributions are not reported in income tax returns, it is obvious that the foregoing are minimum figures. Small but numerous contributions to churches, community chests and local charities are made by many persons who are not in even the lowest taxable brackets.

If all such unreported gifts were to be estimated, how great a total they would aggregate is a matter of conjecture. Careful studies have been made, but their estimated totals on annual giving have varied from $500,000,000 to five times that amount. Of the definitely known $10,500,000,000 contributed between 1922 and 1938, $7,105,958,000 was in individual gifts, $2,598,781,000 was in charitable bequests and $816,385,000 was in grants by philanthropic foundations. Included also is $62,695,000 of corporation gifts for 1936 and 1937, the only two years for which government figures are available.

The annual trend is shown by the following:

1. Government figures for individual contributions rose steadily from 1922 to 1928 when they amounted to $532,893,000. Subsequently they fell sharply and recovered so that in 1937 these contributions amounted to $440,010,000. In 1938, the latest available year, they fell off slightly but preliminary figures for 1939 indicate that the upward trend was resumed.
2. There is no well defined trend for charitable bequests. The high for the period 1922–38 was $226,708,000 in 1925; the low was $65,928,000 in 1923. In 1938 the total was $178,616,000.
3. A continuing study by the John Price Jones corporation of publicly announced gifts and bequests in seven large cities (New York, Chicago, Washington, Philadelphia, Baltimore, St. Louis and Boston) gives a more up-to-date view of the trend. While these figures are far from complete, since they include only the larger newsworthy gifts, they do serve as an index. Gifts in 1941 were $71,386,773 as compared with $61,997,707 in 1940, and $58,058,032 in 1939. Bequests in 1941 were $58,473,657; in 1940, $15,723,127; and in 1939, $22,661,863.

The 1942 philanthropic picture would unquestionably be dominated by defense emergency appeals. The response to these appeals were forecast as follows:

1. During the 24-month period—Sept. 1939 through Aug. 1941—a total of $43,209,757.51 was reported to the secretary of state as having been contributed by the people of the United States for relief in foreign countries.
2. During World War I (April 1917 through Nov. 1918), $537,000,000 was given by the U.S. public to major campaigns for war services, an 18% oversubscription of their combined objectives. In the summer of 1941, prior to U.S. entrance into the war, the United Service Organizations for National Defense, Inc. raised $14,626,817, achieving an oversubscription of its goal of 35.8%.

The demands upon United States generosity during 1942 were expected to be great. The response was expected to be generous. Donovan, William Joseph (1883–), U.S. lawyer and soldier, was born Jan. 1 at Buffalo, N.Y., the son of a railroad yardmaster and a school teacher. He worked his way through Columbia university, and received his law degree in 1907. In 1916 he organized a cavalry troop in the national guard and served on the Mexican border under Pershing. He saw active service in World War I with New York's famous "Fighting 69th," rising to colonel. He won the nickname "Wild Bill" for his daring and was decorated by the United States, French and Italian governments. In 1924 he was appointed assistant to Harlan Fiske Stone, then attorney general, and was renamed to that post by Pres. Coolidge, 1925–29. In 1932 he ran unsuccessfully for governor of New York on the Republican ticket. He was a military observer in the Spanish Civil War and in the Ethiopian campaign. In July 1940, he went abroad on a "special mission" for Secretary of Navy Knox; on his return he reported on nazi fifth column activities in Europe. He set out on another mysterious mission in Dec. 1940 that developed into a 30,000-mile tour of Europe and African battlefields; this trip was described as a search for facts on the status of Allied resistance to the axis. On July 11, 1941, Pres. Roosevelt named Donovan co-ordinator of defense information at the head of a new intelligence agency designed to filter information and propaganda pouring into the U.S. capital via the press, radio and publications.

Dormoy, Marx (1889–1941), French politician, was named after Karl Marx by his father, a militant French Socialist. Marx Dormoy, also a staunch Socialist, had been deputy from Montluçon since 1931. After the suicide in 1936 of Roger Salengro, interior minister in Leon Blum's popular front cabinet, M. Dormoy took over this key post, which he held until 1938. In Jan. 1940 he voted for expulsion of those French communists in parliament who still adhered to the Communist International, and in July 1940 he opposed giving Marshal Pétain dictatorial powers and protested vigorously against the abolition of parliamentary rule.

Because of his outspoken opposition to Vichy's fascist rule, he was interned after the German occupation. Released early in the spring of 1941 under police surveillance, M. Dormoy was killed when a time-bomb exploded in his hotel room near Montelimar, July 26.

Driesch, Hans Adolf Eduard (1867–1941), German biologist and philosopher, was born Oct. 28 at Kreuznach, Germany. An internationally known philosopher, Dr. Driesch lectured in China, Japan and the United States, was awarded honorary degrees by many universities, and was a member of many scientific societies of Europe. During a visit to Harvard university in 1926 he advocated "an eventual United States of the world." But in 1934, a year after Hitler's rise to power, he was won over to the ideas of national socialism and incorporated them in his philosophic teachings. He died in Leipzig in April. (See *Encyclopædia Britannica.*)

Drought. Droughts generally are characteristic of the outer portions of the humid climates where near-by arid conditions sometimes are transported by shifts in the prevailing weather pattern. Less frequently, the heart of a humid area is

affected by serious dryness. Both types of climatic regime were affected by drought in different parts of the world in 1941.

In the subhumid areas, the most serious drought of 1941 was the extension of the 1940 drought in Australia well into the new year. The wheat crop of that country was the smallest in 21 years mainly because of the serious moisture deficiency, and the 1941–42 crop had a poor start as drought continued in many areas. Most of the wheat region was without sufficient rain until midwinter (June, July and August). Dust storms developed in some of the drier areas and soil losses by wind erosion were reported.

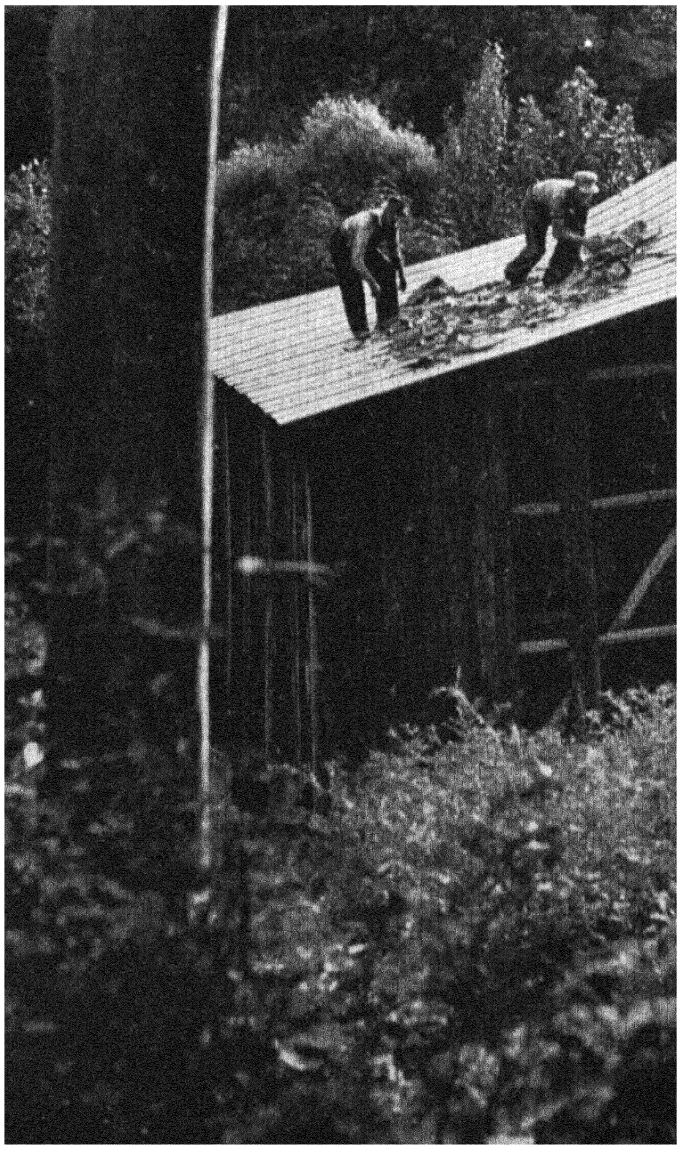
Southern Rhodesia, another subhumid area of the southern hemisphere, experienced a moisture deficiency in cereal-producing sections, although 22% of the wheat acreage is irrigated and therefore less subject to drought risk.

In the United States, the normally very humid east and south suffered from drought conditions while the great plains and other interior parts of the country had adequate rains. There were two periods of drought, in the spring and again in the fall. The spring drought was severe in nearly all regions south of the Potomac and Ohio valleys, lasting from midwinter until early June. May was the driest month, with only 13% of the normal precipitation in South Carolina, 26% in Georgia and Tennessee, 27% in North Carolina, 29% in Virginia and less than 35% in large sections of Kentucky and Alabama. Crops developed poorly and some planting was abandoned on account of the extreme dryness of the soil. Pastures became so poor that a considerable amount of stall feeding was necessary. Water available for hydroelectric plants was critica... ...N. (*See* also METEOROLOGY.)

The fall drought visited these same areas again and included also southern New England and the Middle Atlantic states. In New York city, only 3% of the normal precipitation occurred in September, while Baltimore and Philadelphia each had 15% of their normals. At Asheville, N.C., there was only 9% of the normal in September, and figures covering the entire state of Tennessee indicated only 24% of normal. A considerable fire hazard developed in the upper Appalachians, and some of the woods in New England were closed to the public. The most serious consequence was a shortage of hydroelectric power in the southeast. This also affected the great Tennessee valley power project. Reservoirs were reduced in depth by 15 to 20 feet or more. To conserve power for defense industries, some cities and towns had partial peacetime blackouts.

A midsummer dry period, accompanied by high temperatures, affected the Canadian prairies and the valleys of the Red river of the north and upper Mississippi in the United States. The drought was relatively short-lived, however.

Drought and dust storms were reported in North Africa, figuring prominently in the fighting of British and Italian-German troops there. The inadequate winter rainfall affected the wheat crop of Tunisia. (*See* also AGRICULTURE; IRRIGATION; SOIL EROSION AND SOIL CONSERVATION.) (H. R. B.)



DRYING PINE BARK, an ingredient of cough syrups, on a barn roof in the Great Smoky mountains, N.C., in 1941. Production of U.S.-grown herbs rose sharply during the year as foreign sources of supply were cut off

Drugs and Drug Traffic. In the United States, June 30, 1941, marked the end of the first year of operation of the Food and Drug administration as a unit of the federal security agency, after a third of a century of food- and drug-law enforcement under the department of agriculture. It marked, also, the first complete year of enforcement of all provisions of the Food, Drug and Cosmetic act of 1938.

Emergency measures of a nation-wide scope were the removal from the market of sulphathiazole tablets seriously contaminated with phenobarbital, a highly potent sedative, and seizure of all outstanding lots of a poisonous permanent wave solution. Significant developments of a less spectacular nature were: increased activity against filthy and otherwise unfit foods, made possible through more accurate laboratory methods of detecting contamination and also as a result of the 1938 act declaration that food manufactured or handled under insanitary conditions is adulterated; more regulatory attention to dangerous drugs to prevent indiscriminate sales to lay users; economic cheats resulting from war conditions that have shifted sources of production; and the promulgation of standards for various types of cheese, flour, cream and processed milk, jams and jellies and oleomargarine.

Samples of 31,713 domestic foods, drugs, devices and cosmetics were collected and examined during the fiscal year ending June 30, 1941. Seizures were made of 2,016 interstate shipments of products found in violation of the act, as contrasted with ...,697 in 1940.

Criminal prosecution was instituted against individuals or firms responsible for 1,155 alleged violative shipments, as compared with 337 shipments in 1940. Five injunctions to restrain violations of the act were procured. Of 15,434 import shipments inspected, 2,605 illegal lots were refused entry. Manufacturers submitted 1,376 new drug applications to the administrator during the year. Coal-tar colours certified totalled 2,249,302 lb.

(W. G. CA.)

League of Nations.—In the midst of an ever-extending war, the international control organs—the Permanent Central Opium board (P.C.O.B.) and the Drug Supervisory body (D.S.B.)—

were able to carry through the essential obligations entrusted to them under the various opium conventions. Their activities continued at the headquarters in Geneva, Switzerland with branch offices at Washington, D.C., established there in Feb. 1941 in order to overcome some difficulties of communication with certain countries. With few exceptions governments furnished statistics and information. Of the 65 parties to the conventions not one had denounced because of the war.

On Dec. 1, 1941, the D.S.B. transmitted to governments the "Statement of Estimated World Requirements of Dangerous Drugs in 1941." This statement, covering 177 states and territories, is the basis on which the machinery of international control of the manufacture of and the trade in drugs functions, and indicates the limits within which states are under an obligation to restrict manufacture and trade in drugs. In respect of five principal drugs the limits of the world manufacture and trade in 1941 were estimated at 43·9 tons for morphine, 30 tons for codeine, 4·6 tons for cocaine, 2·9 tons for dionine and 0·8 tons for heroin. In Dec. 1941 the P.C.O.B. issued its report on the work of the board during 1940. Covering information was received from some 150 countries, colonies and dependencies.

Both boards noted that the importance of the national and international control of drugs is not diminished in wartime; on the contrary, as the experience of World War I showed, it is accentuated by conditions which affect the entire world.

The Drug Control service of the League of Nations carried on from Geneva. It distributed to governments all the official information, such as the annual reports, new laws and regulations, seizures in illicit traffic, etc.

Because of restricted trade routes in wartime, the illicit traffic in drugs had considerably diminished. The illicit market, however, was still being supplied mainly from the far east. There was hope that the change in the Iranian administration would put an end to the shipments of Iranian opium to the far east.

The situation in respect of the illicit trade in drugs did not improve in the parts of China which were under Japanese military occupation.

All the vigilance of the national and international controls will be required to prevent a recurrence on a large scale of drug addiction and smuggling, which occurred after World War I, and which moved governments to set up, after the war, the control system which continued to function throughout 1941.

Dubois, Eugene (1858–1941), Dutch physician and geologist. In 1891 Dr. Dubois discovered skeletal fragments in Java of what he then believed was the "missing link" between the apes and man. The fragments consisted of a skull top, thigh bone, three teeth and part of a lower jaw. These fossilized remains, which were allegedly 500,000 years old, were named by Dr. Dubois *Pithecanthropus erectus*. At first he claimed that his find was an ape-man, but he changed his views several times, and in 1937 he reported that the Java fragments were really those of an ape and not a man. He died at his home in the Netherlands in February.

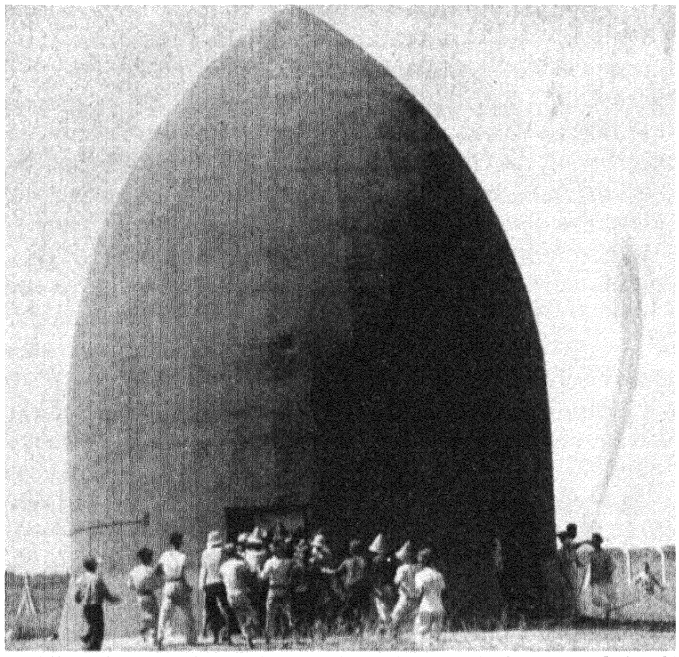
Dutch East Indies. The largest colonial possession of the Netherlands and the main centre of Dutch participation in World War II against the axis powers, the Dutch East Indies consists of a huge archipelago, with several large islands, Java (*q.v.*), Sumatra (*q.v.*), Celebes, Borneo (*q.v.*) and New Guinea (part of Borneo is British and part of New Guinea is Australian) and many smaller ones. The archipelago is located near the equator from 6° north latitude to 10° south latitude. It is south of the Philippines, southeast, east and west of the Malay peninsula and north of Australia. Capital, Batavia. Governor general in 1941 (appointed in 1936): Jonkheer Dr. A. W. L. Tjarda van Starkenborgh-Stachouwer. Area, 733,681 sq.mi.; pop. (1930), 60,731,025; estimate (1940), 70,476,000. More than two-thirds of the population of the archipelago lives in densely populated Java and in Madura, a small adjacent island. The Dutch East Indies is administratively divided into Java and Madura and the so-called Outer Islands, which are much less developed and less thickly populated. The official estimate of 1940 credited Java and Madura with a population of 48,416,000, and the Outer Islands with 22,060,000. In 1930 there were 8,238,570 inhabitants in Sumatra, 2,194,533 in Borneo, 4,226,586 in Celebes. Largest cities: Batavia (437,000); Surabaya (313,000); Bandung (167,000).

History.—The generally placid history of the Dutch East Indies, broken only by a few native uprisings, became decidedly stormy after the German occupation of the Netherlands in May 1940. A state of chronic tension developed in the relations between Japan and the East Indies. There were official and semi-official statements in Tokyo that claimed the East Indies as part of the greater east Asia in which Japan's interests should predominate—a claim that was firmly rejected by the Dutch authorities. An economic mission, headed by Minister of Commerce Kobayashi, was sent to Batavia in Sept. 1940. The negotiations initiated by this mission led to no definite results, and Kobayashi returned to Japan in December. Japan's desire for larger shipments of oil from the East Indies was satisfied to some extent, however, when the big Mitsui firm concluded an agreement with the Royal Dutch and Standard Vacuum interests, providing that Japan's import quota of petroleum products should be raised from 494,000 tons to 1,800,000 tons. However, high-octane aviation gasoline was excluded from the scope of this agreement. Early in 1941 a new Japanese delegation, headed by the veteran diplomat, Kenkichi Yoshizawa, arrived in Batavia. Japanese demands expanded until they included permission to explore the Outer Islands, concessions, the establishment of an air line from Japan and mining and fishing rights. The Dutch showed little disposition to accede to these demands, and Yoshizawa left the Dutch East Indies in June 1941.

In the following month the general imposition of sanctions on Japan by the United States, Great Britain and the Netherlands Indies brought all trade to a standstill. Although the Dutch East Indies are more remote from Japan than the immediate objects of the Japanese onslaught, Hongkong, the Philippines and Malaya, their economic wealth was undoubtedly one of the main objectives of the Japanese southward drive, and Japanese landings in Tarakan island, off Borneo, and in the northeastern part of Celebes took place on Jan. 11, 1942. The Dutch navy and air force had already been in action against the Japanese, co-operating with the British and Americans; and it was reported that Dutch submarines had sunk a number of Japanese transports and cargo vessels. (*See* WORLD WAR II.)

Education and Religion.—There were 21,440 schools of all types in the Netherlands Indies, with 49,622 teachers and 2,324,505 pupils, in 1939. Government expenditure on education in 1939 was 31,267,100 florins. In 1930, 7.2% of the population of the archipelago was literate. The great majority of the native population are adherents of the Mohammedan



NATIVES of the Dutch East Indies . . . into a new beehive type of air-raid shelter in 1941 during a drill

religion, although in some of the islands Hindu and pagan rites are mixed with the doctrines of Islam. There are about 2,500,000 Christians, about 1,000,000 Buddhists and a considerable number of primitive Animists.

Defense.—The Netherlands East Indies army at the time of the Japanese invasion was estimated to possess a strength of 125,000 men. All able-bodied Netherlanders between the ages of 18 and 46 were conscripted for military service after the invasion. Conscription was applied in some degree to the native population. The navy, according to reliable estimates, consisted of 3 cruisers, 8 destroyers, 18 submarines and 42 torpedo boats. The air force had been considerably reinforced by purchases from the United States and was supposed to number between 500 and 1,000 planes, including Glenn Martin, Curtiss and Brewster Buffalo types, Dutch Fokker fighting planes and Dornier flying boats.

Finance and Banking.—The Dutch florin (53.1 cents U.S. in 1941) is the unit of currency. The Java bank is the central banking institution and controls the note issue, and there are several other Dutch and foreign banking institutions in the archipelago. The amount of currency in circulation increased from 198,921,000 florins on April 1, 1940 to 215,885,000 on April 1, 1941. The budget for 1941 anticipated 509,000,000 florins of revenue and 644,200,000 florins of expenditure. The long-term debt of the Netherlands Indies is negligible, only 1,212,000 florins at the end of 1940. Outstanding treasury paper, on the other hand, increased from 122,600,000 florins at the end of 1939 to 206,000,000 florins at the end of 1940.

Trade and Communication.—Imports in 1940 were 444,300,000 florins and exports were 873,500,000 florins. During the first four months of 1941, imports were 118,900,000 florins and exports were 287,500,000 florins. There was a substantial increase in the export trade of the Netherlands Indies with the United States, exports to the U.S. rising from 146,900,000 florins in 1939 to 290,900,000 florins in 1940, while imports from the U.S. increased from 63,700,000 florins to 102,800,000 florins over the same period of time. There was a strong demand in the United States for such strategic raw materials as rubber, tin, bauxite and cinchona (the source of quinine), while the Netherlands Indies purchased planes and munitions in the United States. There was a considerable shift in the character of Netherlands Indies foreign trade under the impact of the war. There was a booming market for the following commodities (export figures for 1940 in parentheses): rubber (581,941 tons); crude tin (22,388 tons); tin ore (30,000 tons); petroleum (9,343,700 tons); bauxite (237,554 tons); coal (792,657 tons); cinchona (8,587 tons). Sugar and coffee exports, on the other hand, were down by 40% in 1940, by comparison with 1939, and coffee and sugar, along with pepper, copra and tobacco, were reckoned among the "weak products" in export trade because of closed markets and lack of cargo space.

The Dutch East Indies in 1940 contained 43,450 mi. of highways and 4,620 mi. of railways, of which 3,387 were in Java and 1,233 in Sumatra. There were 85,620 motor vehicles of all types in the archipelago in 1940. About 10,870 steamers, with a tonnage of 12,456,664, cleared from East Indian ports in 1939, together with 3,203 sailboats, with a tonnage of 167,675. The Royal Netherlands Airways was formerly one of the main routes of air communication between Europe and the orient, with its terminus at Batavia. The European connection ceased after the German occupation of the Netherlands; but an island service was maintained, connecting the principal cities of Java and Sumatra. There were also air routes between Surabaya and the oil ports of Balik Papan and Tarakan and between Java and Macassar, north Celebes and New Guinea. (*See* also JAPAN; NETHERLANDS COLONIAL EMPIRE.)

Dyestuffs. World War II directed particular attention to the indispensability of an integrated chemical industry to the welfare and security of the United States. The great value of a U.S. organic chemical industry in the existing emergency was duly significant since it supplied large quantities of vital materials for the manufacture and colouring of all types of textiles, paper, leather, paint, rubber and other diversified products. Many organic chemicals and intermediates normally required in dyestuff synthesis were utilized in the defense program. Despite this, however, dyestuff production reached a peak never before attained. The latest available figures for coal-tar dyes manufactured in the United States were for 1940. These show production of 127,834,000 lb., being an increase of 6·4% over the preceding year while sales were 8·8% higher than in 1939 and valued at $76,432,000. Production of fast vat colours increased slightly and represented 14·8% of the total.

The activity in both sales and production in 1940 was due largely to improved business caused by increased civilian consumption and indirectly by military requirements. Production for strictly military use, however, did not constitute a substantial portion of the 1940 output of synthetic organic chemicals. Other factors which influenced production were the building up of inventories by producers and consumers and an increase in exports together with a decrease in dye imports. In 1940, 1,800,227 lb. of coal-tar dyes were imported into the United States representing a decrease of 65% over the preceding year. Importations again covered colours which were not manufactured in the U.S. because of patent restrictions and specialty colours whose sales volume was not sufficiently large or important to warrant expenditures for manufacturing equipment.

Preliminary figures for 1941 indicated that consuming industries were supplied with a greater quantity of dyes than during any previously known period in the history of the United States. It was estimated that production was 30%-40% higher than for 1940 with dye plants working on a 24-hour schedule.

Processors recognized the advantages of colour durability in merchandising textiles, and the utilization of vat colours in a wide variety of fibres and constructions continued to increase. As a result, the quality and fastness of the dyed materials reaching the ultimate consumer were better than ever before. For military purposes also, vat colours played an important part. Because of their outstanding fastness, certain vat colours were almost exclusively reserved for the production of olive drab and khaki shades on cotton uniform cloths.

Constantly changing conditions, the increasing demand for textiles of all descriptions for both civilian and military needs and the shortages of necessary materials brought with them new and complex problems. The emergency compelled the dye and textile industries to derive the utmost value from available raw materials. This required the closest co-operation between producer and consumer and called for concerted action on the part of textile, machinery, chemical and dye manufacturers. (A. G. BN.)

Ear, Nose and Throat, Diseases of.

Lipid Pneumonia.—More than fifteen years ago Laughlen called attention to a type of pneumonia caused by the aspiration into the lungs of oily medicaments administered either intranasally or by mouth. Several names have been applied to this condition, such as lipoid pneumonia, pneumoliposis, paraffin pneumonia, lipid pneumonia, steatosis of the lungs, lipoid cell pneumonia, but the term "lipid pneumonia" as suggested by Graef seems to be the most appropriate.

Extensive studies of this subject have been undertaken by many investigators, and to attempt even the most superficial review

would not give adequate credit to the many deserving workers. With this thought in mind, the essayist has drawn largely from the writings of Paul R. Cannon of the department of pathology of the University of Chicago, who has so thoroughly reviewed this problem.

Briefly the entrance of foreign lipids into the lungs produces varying degrees of inflammatory changes in the lungs ranging from a simple congestion and oedema to necrosis, and these effects may be acute, chronic, localized or diffuse. More so has it been found that animal oils, especially cod-liver oil, are highly irritating, though the vegetable oils such as olive oil, cotton-seed oil, sesame oil and poppy-seed oil are relatively nontoxic, the latter, as iodized poppy-seed oil, has been very useful in bronchography. Even liquid petrolatum, though less damaging, still is far from bland, and many pathologic changes have been found experimentally in the lungs of animals, when purified liquid petrolatum was instilled intranasally.

These points are of extreme importance because of the widespread use of various oily preparations marketed by manufacturing chemists and advertised so widely by the press, radio and other sources and recommended as harmless "nasal oils."

Many patients have been carefully studied by every possible method of precision to determine the actual cause of a persistent chronic cough and review of the history of such cases, in many instances, proved that the patient had been using drops or spray of a "nasal oil," many for considerable periods of time.

In order to prevent lipid changes in the lung from this source, it is only necessary to eliminate the use of such preparations.

The safest preparations for nasal spray or instillation are those of a watery base, either isotonic saline or dextrose.

Photographic Study of the Larynx by Mirror Laryngoscopy.—All laryngologists admit that accuracy in the evaluation of the laryngeal image is necessary; exactitude in the diagnosis is secured, proper prognosis and therapy follow. Louis H. Clerf, professor of broncho-oesophagology, Jefferson Medical College of Philadelphia, after reviewing in moderate detail some of the photographic studies of the larynx by distinguished laryngologists in 1860, continued in 1941 the discussion of some of the procedures used by others, bringing the subject down to date. He also presented his own contribution of a photographic unit embodying the principle of the Garel camera. All the details can be found in the original presentation as noted in the bibliography.

This simple apparatus for photographing the larynx by mirror laryngoscopy may be readily employed because it requires no additional personnel to operate and gives uniformly good results in a majority of patients whose larynges can be visualized by mirror laryngoscopy.

Economic Defense Board: *see* ECONOMIC WARFARE, BOARD OF.

Economic Warfare, Board of.

The Board of Economic Warfare was established under the name of Economic Defense board by President Roosevelt, in an executive order dated July 20, 1941, for the purpose of developing and co-ordinating policies and programs intended to strengthen the international economic relations of the United States.

Vice-President Henry A. Wallace was made chairman of the board; and the secretaries of state, treasury and war, and the attorney-general, and the secretaries of the navy, agriculture and commerce were also named in the initial order as members. The chairman was authorized to appoint other members, and each member was authorized to designate an alternate. Other departments and agencies of the government were directed to designate officers to represent the department or agency in its continuing relationships with the board.

As defined in the executive order, the functions and duties of the board were to advise the president on essential economic defense measures; to co-ordinate the policies and actions of the several departments and agencies carrying on activities relating to economic defense; and to develop integrated economic defense plans and programs for co-ordinated action by the departments and agencies concerned. The board also began immediate investigations of the relationship of economic defense measures to post-war economic reconstruction.

Soon after being formed, the board named Milo Perkins as executive director.

The first move for expansion of the board's authority came on Sept. 15, 1941 when the president signed an executive order placing the Office of Export Control under the then Economic Defense board. Brigadier General R. L. Maxwell, who had been administrator of export control, was assigned to duty in the war department.

The executive order of Sept. 15 also designated the board as the agency to obtain, develop and determine over-all estimates of materials and commodities required for export purposes in the interest of the economic defense of the United States, exclusive of lend-lease operations, and to advise the Supply Priorities and Allocations board (*q.v.*) of such estimated requirements.

When the Office of Export Control came under the Economic Defense board, the division of controls of the department of state was also put under the board as the commodity licensing division of the Office of Export Control.

One of the activities carried on by the Office of Export Control had been a clearing service, to which exporters, manufacturers and foreign importers submitted proposals for the export of materials and commodities. This was reorganized under the board to expedite such clearances through the several federal agencies concerned with the control of exports and related financial transactions.

Another responsibility was given to the board in the executive order of Oct. 28, 1941, which established the Office of Lend-Lease Administration (*q.v.*) and authorized the administrator to make appropriate arrangements with the then Economic Defense board for the review and clearance of lend-lease transactions which affected the economic defense of the United States.

In recognition of the growing importance of the government's economic program in the western hemisphere, the vice-president announced on Nov. 22, 1941, that, with the approval of the president, he had appointed the co-ordinator of Inter-American Affairs as a member of the then Economic Defense board. At the same time the board began a reorganization of its units into four regional divisions under the direction of a chief of operations, Lieut.-Col. Royal B. Lord. The divisions were: the European and African, of which Morris S. Rosenthal was appointed chief; the far eastern, with Charles B. Rayner, chief; the British empire, with William F. Stone, chief; and the American hemisphere, with Carl B. Spaeth, chief. The combined personnel of the commercial

and financial division of the co-ordinator's office and the divisions of the board engaged in western hemisphere matters became the American hemisphere division of the board.

Subsequently, the facilities of the tariff commission, and the bureau of foreign and domestic commerce of the department of commerce, were placed at the service of the board for the duration of the war.

The title of the board was changed from the Economic Defense board to the Board of Economic Warfare, by executive order, on Dec. 17, 1941.

A statistical summary of the work of the Office of Export Control during 1941 follows:

The total number of commodity licences granted, from Jan. through Nov. 1941, was 214,771. The dollar value of these commodities licensed for export, excluding arms and ammunition, was $956,012,413. The value of arms and ammunition licensed for export during this period was $1,920,388,433. The technical data licence division, between April 15, 1941, and Dec. 22, 1941, received 16,771 applications for export licences. During this period, 11,271 special licences and 758 blanket licences were granted. Up to Dec. 11, 1941, the requisitioning division had executed 257 requisitions. Of these, 225 cases had been referred to the Compensation board. A total of 95 cases, representing a value of more than $10,000,000, had been heard by the board. Pending, as of Dec. 20, 1941, were 130 cases of an estimated value of about $18,000,000.

A total embargo on exports to Japan and its occupied territories, by revoking all licences for the shipment of U.S. goods to those countries and to all Japanese nationals anywhere in the world, was established immediately following the attack on the United States by the Japanese armed forces. Export control was extended, as of Dec. 23, 1941, to cover all articles and materials not previously brought under control. Even before that date, approximately 90% of all U.S.-produced commodities was under licensing regulations.

Continued flow of articles and materials to American republics and other friendly destinations under broad general licences was encouraged under policies of the board. (*See* also DEFENSE, NATIONAL [U.S.].)

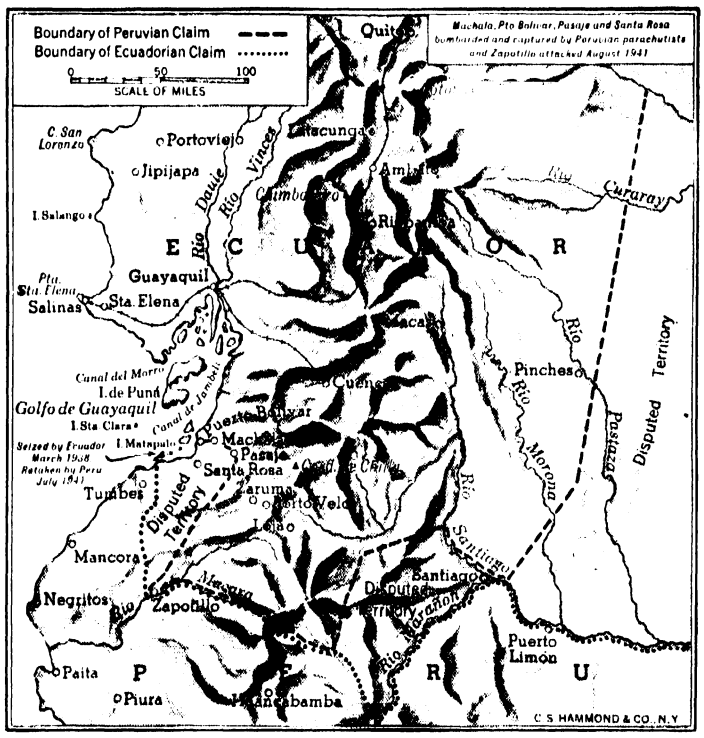
(H. A. WAL.)

Ecuador, a South American republic, located on the Pacific coast, astride the equator and the Andean plateau; the area (including the Galápagos islands, 2,400 sq.mi.), according to Ecuadorian claims, was 337,392 sq.mi. in 1941, but a third of this was disputed with Peru. The population was estimated in 1941 at around 3,500,000. Chief cities: Quito, the capital (140,000); Guayaquil (120,000); Cuenca (42,000); Riobamba (21,200). President in 1941: Dr. Carlos Arroyo del Río.

History.—During 1941, political unrest and uncertainty, underlaid by the acute boundary dispute with Peru (*q.v.*) which at times broke into open hostilities, dominated Ecuador's history as the World War II crisis steadily increased its threat. Disorders were frequent, and many observers felt that only divided opposition permitted Pres. Arroyo's continuance in power. The delicate political balance prevented acceptance of proposed border settlements with Peru or consummation of any agreement with the United States permitting a naval or air base on the strategic Galápagos islands, lest the opposition be given political ammunition. At the same time, the situation gave openings for pro-axis propagandists, who were active throughout the year. Upon Russian entry into the war, nazi agents were active in propaganda among conservative, strongly Roman Catholic elements. Earlier, one German diplomatic attaché was expelled. Anti-Japanese feeling was strong, especially after alleged Japanese military aid to Peru. Following formal entry of the United States into World War II, Ecuador accorded that country nonbelligerent rights and interned a number of Japanese.

Defense.—The army has a peacetime strength of 7,500, with 12,500 reserves. The small air corps, formerly Italian-trained, was supervised by United States army aviation officers after March 1941. The navy comprised one training ship in 1941.

Finance.—The monetary unit is the sucre (value: 6¾ cents U.S. in 1941). The 1942 budget called for receipts and expenditures of 130,800,000 sucres (1941: 125,902,000). National defense was allotted 18.8% of the grand total, education 15.4%.



MAP OF TERRITORIES disputed by Ecuador and Peru. Fighting between the two countries broke out in July 1941

Trade and Resources.—In 1940, imports amounted to $11,155,000 (1939: $10,184,000), with the United States supplying 59.4% (1939: 48.7%), Japan 10.5% (5.3%), Great Britain 7.5% (5.5%), Italy 4.1% (3.1%), France 3.6% (4.9%), Germany 2.0% (18.1%). Latin American countries supplied 5.5% (1939: 6.9%), with 1.4% each from Colombia and Chile. Exports, $10,549,100 (1939: $11,514,000), not including $753,487 gold (all to the United States), went largely to the United States (59.9%; 1939: 49.1%). Other Latin American countries took 27.3% (1939: 19.9%), with Uruguay 8.2% (entirely petroleum), Peru 4.7%, Colombia 3.6% and Chile 3.0%, leading. Japan (3.3%; 1939: 3.9%) and Great Britain (2.1%; 1939: 3.7%) were the largest non-American customers. Continental European countries took only 5.0% (1939: 22.8%).

In the first nine months of 1941, imports declined 20.3%, with the United States supplying 74%; exports increased 14.7% (73.6% to the United States), with especially sharp rises in mineral shipments except petroleum, which declined more than a third. The leading export commodities in 1940 were: cacao, 28.3% (1939: 36.9%); cyanide precipitates, 28.1% (26.2%); petroleum, 24.6% (24.9%); coffee, 15.8% (15.1%); rice, 14.1% (6.4%); copper and lead concentrates, 10.5% (none in 1939); tagua (vegetable ivory), 8.4% (9.5%); bananas, 6.3% (6.9%).

Cacao and coffee are the chief export crops, bananas (half to Chile) the third. In 1941, the cacao and rice crops were among the best ever. Cotton was insufficient for domestic production in 1941, sugar only slightly more than adequate. Balsa wood production increased greatly after 1939 (1,402 tons export), with 2,298 tons exported in the first eight months of 1941. Kapok (1940: 384 tons) and rubber (1,509 tons) gave promise of considerable expansion.

Petroleum output (1940: 2,349,000 bbl.) fell sharply in 1941. In 1940 1,389,678 grams of gold were mined, over 50% greater than in 1937. Petroleum, cyanide, copper and lead production was almost entirely in foreign hands in 1941, and contributed little to the national economy.

Communication.—External communication is by sea and by Pan American airways. Except for petroleum, nearly all exports are shipped through Guayaquil. Internal communication is by domestic airlines (formerly German-controlled), 600 mi. of railway, the Guayas river and a 3,500-mi. highway system. The last was thoroughly inadequate in 1941, but was being greatly improved and expanded under credits from the U.S. Export-Import bank. (*See* also HISPANIC AMERICA AND WORLD WAR II.)

(L. W. BE.)

Eden, (Robert) Anthony (1897–), British statesman, was born June 12 and was educated at Eton and at Christ Church, Oxford. After service in World War I (1915–18), he contested the Spennymoor division of Durham in 1922, and in the following year he was elected for Warwick and Leamington, which he thereafter continued to represent. From 1926 to 1929 he was parliamentary private secretary to Sir Austen Chamberlain. He then became undersecretary for foreign affairs and, in 1934, lord privy seal and a privy councillor. In June 1935 he entered the cabinet as minister without portfolio

for League of Nations Affairs, holding this post until the following December, when he became foreign minister. Disagreement with Prime Minister Chamberlain over the latter's policy of "appeasing" Germany and Italy led to his resignation Feb. 20, 1938. Upon the outbreak of war Sept. 3, 1939 he re-entered Chamberlain's cabinet as dominions secretary. On May 11, 1940, he was named secretary of state for war in Churchill's cabinet, and on Dec. 23, 1940, he was appointed to the foreign ministry again.

In Feb. 1941 Eden arrived at Cairo on a military and diplomatic mission in the middle east and the Balkans. On Feb. 26 he was in Ankara, Turkey with Gen. Sir John Dill to confer with Turkish leaders, and the following day it was announced that Britain and Turkey had reached "full agreement on all points." Eden then proceeded to Athens, where on March 5 he promised Greece the greatest possible military aid. On March 18 he conferred with the Turkish foreign minister at Cyprus, and at the end of the month he returned to Athens for conferences on joint strategy. He was back in London April 10.

Eden was praised by Churchill in July for his part in concluding the British-U.S.S.R. pact, and he also had a hand in the Polish-U.S.S.R. pact signed at London July 30. At the end of 1941 Eden travelled to Moscow for a conference on war problems with Stalin.

Education. **Education and the Threat of War.**—The threat of war had already begun to cast its shadow over education in the United States before the actual outbreak of hostilities in the last month of 1941. The rise of defensive industries, the development of new industrial centres and the consequent migration of families, and the selective draft had already begun to affect the normal progress of education and to lend additional significance to all the implications of the movement which had been started in 1940 for education for national defense. It became clear during the year that two important issues were involved in this movement. The first was concerned with the more immediate problems of national defense—the supply of an adequately trained personnel for defense industries and the provision of educational facilities for the children of workers attracted to the new defense centres. The second issue was to define more clearly than ever before the meaning and significance of those democratic ideals which were to be defended, preserved and made the basis of an educational program for the United States. While educators had already begun to devote attention to the second issue since the Congress on Education and Democracy was held at Teachers college in Aug. 1939, and during 1940, a strong lead was given by President Franklin D. Roosevelt in his reiterated emphases on the four freedoms.

Provision of Educational Facilities.—Special provisions were made during 1941 by local, state and federal agencies to organize existing facilities for vocational education and to create new schools and courses to meet the emergency. Despite lack of qualified teachers, suitable buildings and other facilities, educational authorities met the emergency by utilizing whatever buildings were available and by adopting two, three or even more shifts for vocational training. With the aid of a federal appropriation of $65,000,000, administered by the U.S. Office of Education, it was estimated that more than 1,500,000 defense workers would be trained, while another appreciable number were being trained under the auspices of the National Youth administration (*q.v.*) and the Civilian Conservation corps (*q.v.*), giving a total of 4,000,000 persons in all trained for aircraft construction, for shipbuilding and electrical industries, and for the mechanics branches of the army and navy. Training under emergency conditions might prove to be valuable when the time came to meet the needs of men returning from military service or from defense to nondefense industries.

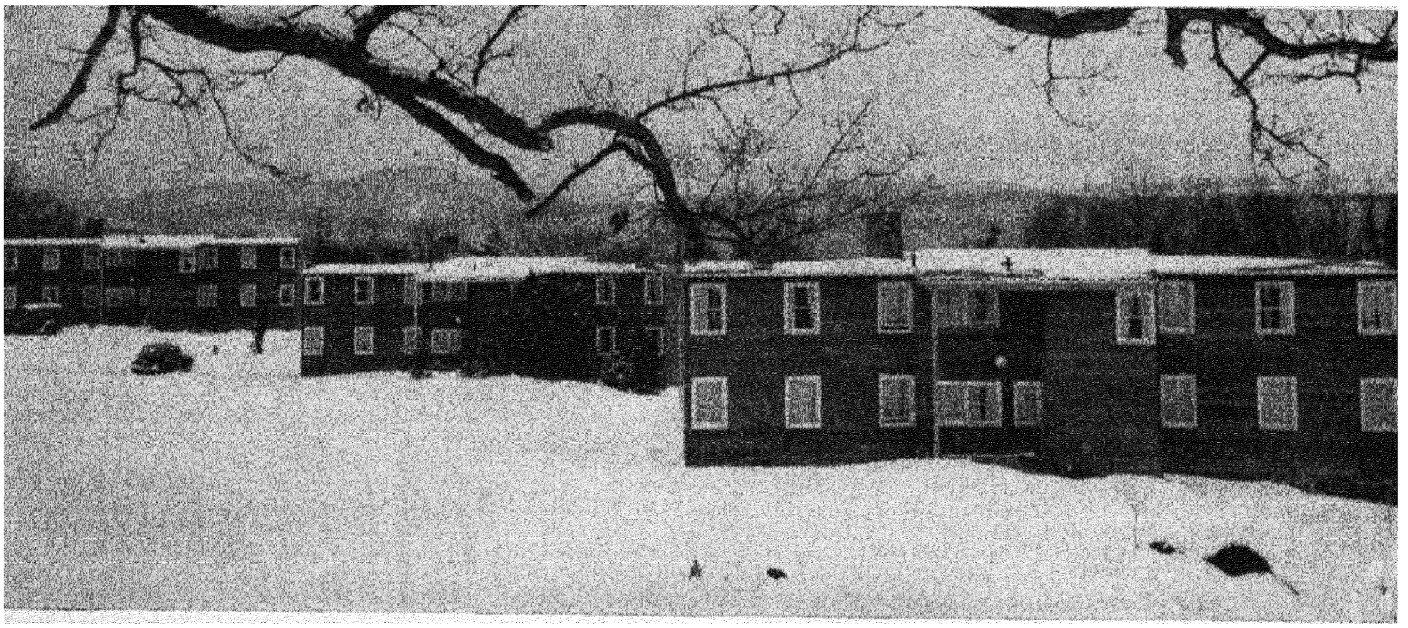
The impact on the regular system of education was perhaps not altogether unexpected. At the high school level the shift from general to vocational education, which had been under way for some years, was intensified, while at the college level there was an increase in the number of students in the science, engineering and medical divisions in preparation for defense services. In New York city alone the enrolments of students in vocational schools and courses showed an increase of 15%.

More serious, however, was the problem created for administrative officials by the rise of booming defense centres and the establishment of army camps. A shift in the school population at the elementary and high school levels, estimated at about 300,000, had to be met by the provision of new classrooms and additional numbers of teachers. At the beginning of the school year in Sept. 1941, a shortage of school facilities was reported in 500 localities; from 15,000 to 20,000 children for whom school accommodations were not available enjoyed extended school vacations. Congress appropriated $150,000,000 to be devoted to the construction of school buildings to help defense areas to take care of the increased school population. The situation was further complicated by the withdrawal of teachers for army and defense services, while the new positions to be filled in the defense areas required, according to some estimates, about 1,000 teachers.

It was too early, particularly since war had not yet broken out, to estimate the probable future trend. Nevertheless some alarm began to be felt for the status of general education in the high schools and the liberal arts in the colleges. A decline was already noted in the number of students taking courses in French and German, paralleled by an increase in the numbers studying Spanish, partly because of public attitude to France and Germany in general and partly because of the widely cultivated interest in Latin-American relations. This interest was part of a general interest in contemporary affairs including social studies, international relations and their backgrounds in history.

Shortage of Teachers.—The shortage of teachers was not confined to the new boom towns. On the basis of a nation-wide survey the National Commission for the Defense of Education through Democracy announced that the country faced a serious shortage of qualified teachers, which would be felt most acutely in rural schools and in the field of vocational education. The reason was to be found only in part in the selective draft; more important was the attraction of better salaries in defense industries. Enrolment in state normal schools and teachers' colleges showed a decrease of 11% and in university schools of education where secondary school teachers are prepared, of 8%. A number of states (Louisiana, Tennessee, Kentucky, Georgia, Virginia and Nebraska) planned to grant emergency certificates to teachers, a plan which meant lowering of standards. The nature of the shortage varied in different parts of the country, at different levels of the school system and in different subjects. In the larger metropolitan areas there had in fact existed an oversupply of teachers. To meet the situation of a shortage in some parts of the country and an oversupply in others the suggestion was made that the U.S. Office of Education co-operate with local and state authorities in distributing teachers where they are needed. Looked at from the long-term point of view the shortage, according to another suggestion, could only be remedied by increasing the salaries of teachers; it was estimated that an average country-wide increase of 15% would add approximately $200,000,000 in wages to teachers of the United States in the next academic year.

Educational Statistics.—The following estimates for the school year 1941–42 were issued by the U.S. Office of Education



AN EVACUATION CAMP for school children of New York city was built in the spring of 1941 at New Milford, Conn. to serve as a model for other similar projects should Manhattan be subjected to air raids

in Nov. 1941: The enrolment in elementary schools was 20,707,000 (18,482,000 in public and 2,225,000 in private schools); the kindergartens had an enrolment of 665,000 (625,000 in public and 40,000 in private schools); the number of teachers in elementary schools was 700,000 (625,000 in public and 75,000 in private schools). In four-year high schools there were 7,334,000 pupils (6,834,000 in public and 500,000 in private schools) taught by 350,000 teachers (315,000 in public and 35,000 in private schools). According to the estimates, 2,520,000 pupils attended one-teacher schools while 4,600,000 were transported to schools at public expense. In institutions of higher education it was estimated that the total enrolment was 1,450,000 students.

Teachers' Salaries.—Before a general recovery from the effects of the depression period could be effected, teachers' salaries began to feel the influence of rising prices. In view of the better opportunities provided in defense industries which have already been mentioned, the situation was viewed with considerable alarm. The salary losses due to the depression reductions were being made up only in cities of 100,000 and over. Nearly all cities of over 30,000 and 60% of the smaller cities were reported to have salary schedules. The general picture for the country as a whole was as follows in 1940–41: In cities with populations from 2,500 to 5,000 the median salaries for elementary school teachers was $1,149, rising to $2,268 in cities over 100,000; the range of median salaries of high school teachers in the same localities was from $1,428 to $2,768; of elementary school principals from $1,878 to $3,420; of high school principals from $2,136 to $4,806; and of superintendents from $3,219 to $8,605. (See *School and Society, School Life* and the *Journal of the National Education Association.*)

A serious issue was raised in 1941 as a result of the movement for equal pay for white and Negro teachers. It was estimated that in order to bring the salaries of Negro teachers in the south into parity with those of white teachers the additional funds required would amount to $26,036,421 (ranging from $252,488 in Oklahoma to $3,029,550 in South Carolina). Should the movement be extended to bring Negro schools into even approximate equality with white, from $3,000,000 to $8,000,000 would be needed for supplies and $9,000,000 for additional Negro teachers to provide the same teacher-pupil ratio in Negro as in white schools. In 1941 there were 29 pupils per white teacher as compared with 39 pupils per Negro teacher; the average cost per white pupil in 12 southern states was $45.82 as compared with $16.51 per Negro pupil; the investment in school grounds, buildings and equipment was $184 per white child enrolled and $42 per Negro child; the average salaries of white teachers in these states showed a range from $625 a year in Arkansas to $1,565 in Maryland for white teachers and from $237 a year in Mississippi to $1,225 in Maryland for Negro teachers. The situation raised a serious issue which in the opinion of many educators could only be settled in a nation-wide program of federal aid to equalize the burden of providing equality of educational opportunities. (See *Teachers' Salaries in Black and White* prepared by the National Association for the Advancement of Coloured People, New York; also information prepared by the Commission on Interracial Cooperation, Inc., Atlanta, Ga.)

Universities and Colleges.—A serious decrease in university and college enrolments had been generally expected as a result of the selective draft and the opportunities for employment in defense industries. According to the report prepared each year by President Raymond Walters for *School and Society* (Dec. 13, 1941, pp. 539 ff.) the statistics of attendance for 1941 showed a total of 838,715 full-time students or 9.16% less than in 1940, and of 1,269,354 students, including part-time and summer session, or a decrease of 8.88%. All geographical divisions showed smaller enrolments ranging from a decrease of 2.07% in the south Atlantic to 8.97% in the west north central division. The heaviest losses (16.17%) were suffered by 57 universities under public control and by 77 independent teachers' colleges (15.35%); 52 privately controlled universities showed a decrease of 5.9%, while ten had a slight increase. Freshman classes showed a drop of 4.5% as compared with 1940, when there had been a drop of 2% as compared with 1939.

Junior colleges also showed a marked decrease in their enrolments. According to a study made by the American Association of Junior colleges, which received replies from 187 or 72% of the public colleges and from 200 or 57% of the private junior colleges, 29 of the public institutions reported an increase, 19 no change and 139 a decrease. The range was from an increase of 40% to a decrease of a similar amount. Of the private institutions 73 reported an increase, 56 no change and 71 a decrease, with a range from an increase of 60% to a decrease of 50%. (See *School and Society,* Nov. 1, 1941.)

There was a definite shift in the distribution of students. Thus medical schools showed the largest enrolment on record; there was an increase in the number of students in science departments

n general and in engineering schools. There was a reduction in nrolments in law schools and graduate schools of arts and ciences. The outbreak of war raised a number of critical issues s much for the young men and women of college age as for he administrative authorities. The former had to face the serious hoice, in so far as it rested with them, of continuing their studies r of enlisting for defense activities. The latter, particularly in rivate institutions, were confronted with the serious problem f finance caused by reductions in the student body and with he problem of adapting the educational organization to the needs f the times.

Under the selective draft system many colleges planned to ncourage students to complete their courses by making it possile for them to graduate in three instead of four years through he provision of summer courses. No general plan was adopted, ut on Dec. 16, 1941 a number of eastern colleges (Yale, Harard, Dartmouth and Princeton) announced that students would e permitted to graduate in three years by taking courses in ummer, a practice announced earlier by Columbia. State uniersities have always provided undergraduate courses in their ummer sessions. It was not clear at the close of 1941 what the ffect would be of lowering the age for registration to 18.

On this issue President Roosevelt suggested a principle which night serve as a guide under war conditions as it did in the mergency period, when he sent his message to be read at a neeting of the American College Publicity association. "The nessage I would emphasize to you this year," wrote the President, is that America will always need men and women of college raining. Government and industry alike need skilled technicians oday. Later we shall need men and women of broad undertanding and special aptitudes to serve as leaders of the generaion which must manage the postwar world. We must, therefore, edouble our efforts during these critical times to make our chools and colleges render ever more efficient service in support f our cherished democratic institutions." The president thus ombined both the immediate and the long-term issues to be aced.

The other effect of a possible reduction in enrolments would be o aggravate a condition with which private institutions for higher ducation had already been concerned during the depression eriod. Financial contributions had fallen considerably, returns rom endowments had dropped and endowments themselves had egun to shrink. Faced by a further threat of decrease in income hrough decreased enrolments, these institutions might be comelled to increase the cost of education to students and to allow tandards of instruction, salaries and equipment to be lowered, vith serious consequences to the provision of educational opporunities.

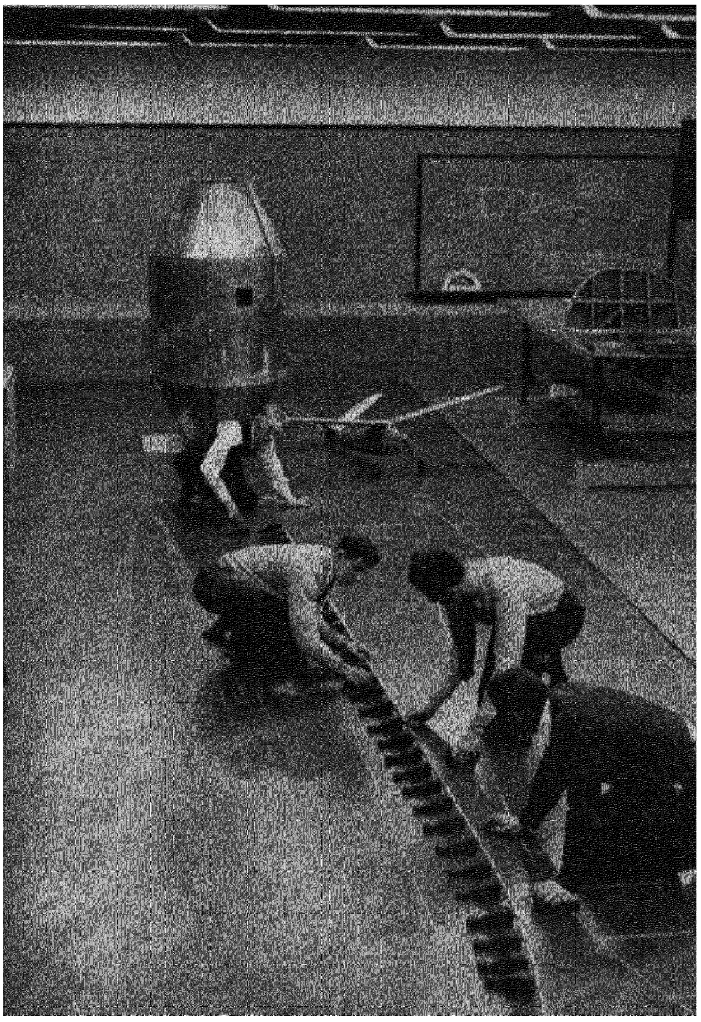
One example alone may be cited by way of illustration. In 940–41, according to an article by A. Calvert Smith on "Harard's Financial Problems: The Threat of Falling Income in Our Universities" (in the *Harvard Alumni Bulletin,* Nov. 1, 941), Harvard derived about 30% of its income from student ees; at the beginning of the academic year, 1941–42, there was 10% overall decline in enrolment (mainly due to the decrease f students in the graduate school and school of law). Slightly nore than 41% of the income comes from invested funds and 3% from gifts and other receipts, both sources dependent on he financial situation of the United States. These conditions eriously threatened the future of salaries (which had weathered he depression without reduction), of scholarships, retiring allownces, maintenance, services and wages. Should financial considerations compel serious reductions here, "the loss (in educational standing) may be far more serious than any budgetary setback."

This statement applied to all endowed institutions. Up to Jan. 1, 1942 endowments seemed to have been administered with great care and skill. The American Council on Education reported during the year that 120 institutions earned 4.06% on their funds in 1940–41 with an expectation of 3.86% in 1941–42. The total amount of funds involved in this report was $1,263,653,000 or 75% of all the endowed funds held by institutions of higher education.

One suggested solution of this financial problem—that aid be secured from state or federal sources—was not received with much enthusiasm. It was viewed with concern because of a desire to safeguard the independence of private institutions and fear of political control or interference, which caused some institutions to reject student aid under the National Youth administration.

There was actually an increase in the number of colleges and similar institutions in 1940–41. According to the *Educational Directory* published in May 1941 by the U.S. Office of Education, there were 29 more institutions of higher education in 1941 than in 1937. The increase was not wholly due to the creation of new institutions but to a reclassification of existing institutions. The total distribution for 1941 was as follows: (the figures for 1937 are given in parentheses for purposes of comparison) colleges and universities 744 (714); professional schools 270 (267); teachers' colleges 190 (173); normal schools 54 (82); junior colleges 462 (468). (For a listing of institutions *see* UNIVERSITIES AND COLLEGES.)

Anniversaries.—While new institutions of higher education were being established older institutions celebrated their anni-

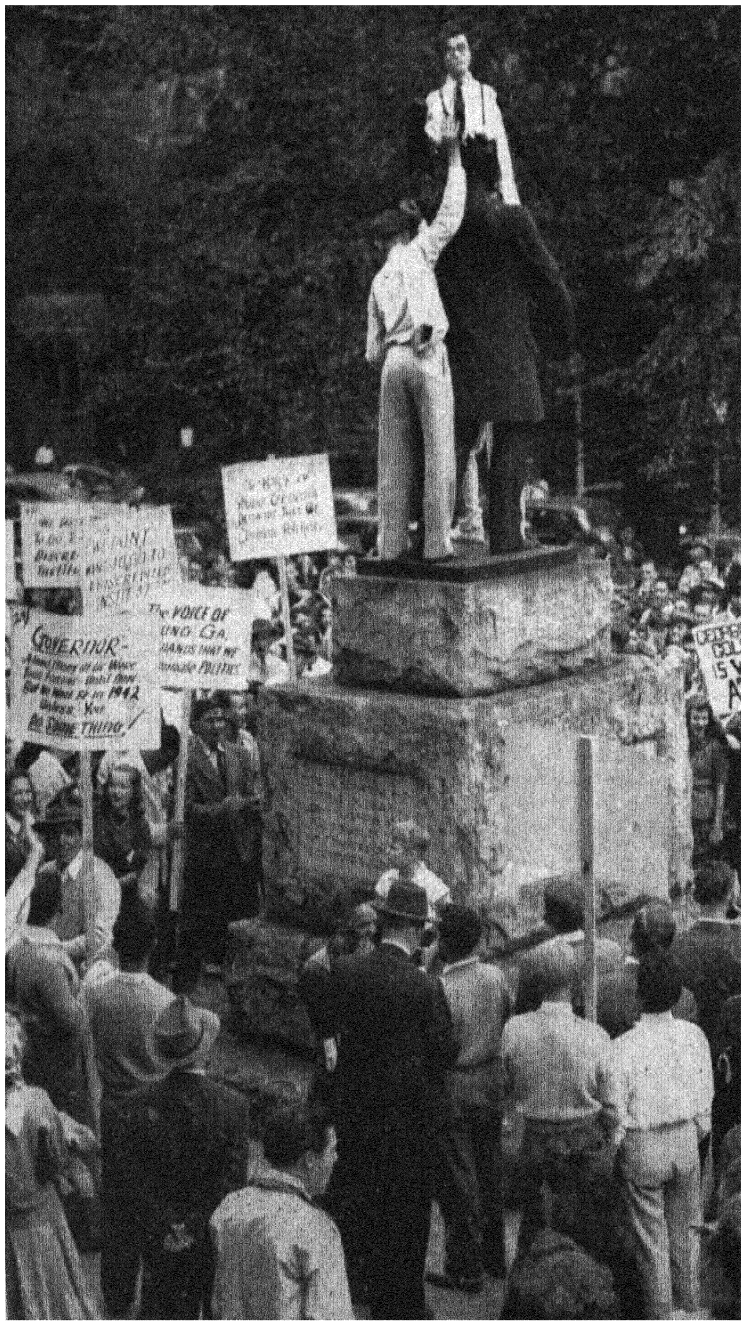


TUDENTS at Burgard high school in Buffalo, N.Y. learning the principles of erodynamics. This school, like many others throughout the U.S.A., was open ay and night in 1941 to prepare boys and men for defense jobs

versaries: Stanford university and the University of Chicago their 50th; Lehigh university and Fisk university their 75th; Fordham university and the University of Michigan their 100th; the University of Vermont its 150th; and Rutgers university its 175th.

Student Aid.—Figures were available on the amount of aid for students in high schools, colleges and universities in the form of scholarships, loans and wages for part-time work. The U.S. Office of Education in its report on *Financial Aids for College Students* announced that in 1937–38 a total of $51,255,145 was devoted by 1,387 institutions to the aid of students, of which 41% was distributed in the form of scholarships, 11% in loans and 48% as wages for part-time employment. The total included a contribution of $9,779,459 from the National Youth administration. The largest sum ($17,747,465) was distributed by private institutions, closely followed by state institutions which spent $17,676,532. Institutions under Protestant control provided $10,289,333; Roman Catholic institutions $2,956,408; and municipal institutions, chiefly junior colleges, $1,585,407. The most usual type of aid was through the provision of part-time employment, while the largest amount of aid in private institutions was through scholarships.

The National Youth administration allocated $21,088,125 for 1941–42 in the 48 states, District of Columbia, New York city, Alaska, Hawaii, Puerto Rico and the Virgin Islands. Students in high schools were allocated $10,039,050 and students in colleges and universities $11,049,075. In states where no facilities were available for Negro college and graduate students an additional sum of $85,000 was assigned. New York city alone was given the sum of $1,210,710 to aid about 15,000 high school and 5,000 college and university students. (See *School Life* and *School and Society*.)



STUDENTS of the University of Georgia held a mass protest meeting before an effigy of Gov. Eugene Talmadge Oct. 15, 1941 at Atlanta, after the governor's dismissal of two faculty members had resulted in the university's expulsion from the Southern University conference, on charges of violating academic freedom

Federal Government and Education.—For the fiscal year ending June 30, 1942, the federal government appropriated $713,985,000 for the following educational purposes created by the emergency situation: programs of the U.S. Office of Education, R.O.T.C. classes in colleges, civilian pilot training, Indian schools, training for merchant marine, apprentice training, WPA education, alien education, school construction in "boom towns," agriculture and home economics extension work, agricultural experiment stations, Civilian Conservation corps and National Youth administration.

The movement for more federal aid to meet permanent conditions continued. In the first session of the 77th congress of the house of representatives 122 bills, dealing with various aspects of education, were introduced. In the senate the most important bill (S. 1313) was that introduced by Senator Elbert Thomas to appropriate $300,000,000 to the states in order to equalize educational opportunities for both white and Negro children, and to provide schools for children of defense and migratory workers and those living on federal reservations. The basis for apportionment of funds was financial ability of the states, the number of children, and the need of additional public school facilities, leaving to states and localities initiative in the organization and administration of schools, in curriculum and methods, and in the selection of personnel.

While the need of increased participation of the federal government in education was generally recognized, the question of control was an important subject of debate. The growing participation of federal authorities in educational activities arising out of the depression which had led to the creation of new authorities like the National Youth administration and the Civilian Conservation corps, had already given rise to conflicts, which were only increased with the rising need of training defense workers. The issues were summarized in a pamphlet, *The Civilian Conservation Corps, the National Youth Administration and the Public Schools*, published by the Educational Policies commission of the National Education association in Oct. 1941.

Two questions were raised in this pamphlet: (1) Should the federal government operate and control educational programs, if state and local agencies cannot do so unaided? Or (2) should the federal government operate through state and local agencies, providing financial aid and leadership but leaving the control over the processes of education to the state and local agencies? Fear was expressed that the second principle followed from 1785 to 1933 had been abandoned when the NYA and CCC extended their functions and entered directly into the field of training and education beyond their original purpose of providing relief, work and employment. The new practice resulted in two systems of vocational training and education of unemployed out-of-school youth, one under federal control and the other under state and local agencies. The report urged the need of a consistent policy to avoid the danger of centralized national control in education. An extension of federal control would result in dual systems of administration, in a division of the educational care of youth be-

tween two authorities, and a class organization of education—one for youth able to remain in school until ready for employment and another for those no longer in school.

The American tradition of decentralization had encouraged greater flexibility, experimentation and progress when state and local agencies had full control and responsibility in education of all kinds. The federal government should refrain from exercising control and, while providing aid to equalize opportunities, should supply leadership through research, experimentation and demonstration to stimulate local efforts. The NYA and CCC should, according to the Educational Policies commission, be discontinued, their functions as agencies for vocational training, general education and guidance should be transferred to state and local agencies, and their functions as public works agencies should be assigned to the appropriate agencies in this field. A clear definition of policy on the relations between federal, state and local authorities was demanded in accordance with American tradition and efficient service in the interests of the education of youth. The recommendations made by the Educational Policies commission had already been stated earlier in the year by the National Committee on Education and Defense. This committee expressed its opposition to the duplication of existing educational facilities by federal agencies and the adaptation and expansion of regular educational agencies to meet the needs of the times to serve all youth according to their needs.

The only action taken in this matter was the adoption by the National Advisory committee of a suggestion made by President Roosevelt that the NYA and CCC be merged and that the services performed by them be continued and maintained. It was estimated that such a merger would mean a saving of $130,000,000.

National Citizenship Education Program.—During 1941 the federal government undertook another educational program. The need for this emerged from the discovery that according to the registration conducted in 1940 by the department of justice there were nearly 5,000,000 aliens in the country of whom about one in six could not write. Under the sponsorship of the immigration and naturalization service of the department of justice a national citizenship education program was instituted, financed by $14,000,000 WPA funds. Facilities were to be provided through the immigration and naturalization service and state and local boards of education to prepare applicants for naturalization and for the duties and responsibilities of citizenship. Classes in citizenship for the foreign-born were to be organized; materials, lesson-plans and other aids for such classes were to be prepared; teachers were to be trained; and financial aid was to be given to all agencies interested in giving the foreign-born a better understanding of English and of the principles of the American form of government. Funds were allocated to state councils to organize classes and teacher-training programs; technical and expert service was provided; and the results of research would be made available. The National Citizenship Education program was under the direction of Dean William F. Russell, on leave of absence from Teachers college, Columbia university, with an office in the U.S. Office of Education.

Adult Education.—The selective draft under which 1,000,000 men a year were to be brought together for defense training brought with it the realization that education and recreation would have to be organized as part of a general scheme to maintain morale. The secretary of war appointed a war department advisory committee on education, recreation and social welfare to draw up a program to meet the new needs. It was proposed that any scheme which might be adopted should be under army administration and army instructors with such additional assistance as might be found to be necessary. It was recognized that provision would have to be made for three levels: (1) an upper level, about 25% of the total, of men of two or three years of high school experience or college experience; (2) a median level represented by about 45% who had completed the eighth grade; and (3) a lower level consisting of men of two, three or four, or no years of schooling, about 30% of the total. A variety of educational-recreational activities was planned including motion pictures, radio, drama, listening groups, discussion groups, library service, lectures, workshops and organized instruction through correspondence courses of class work. Toward the end of the year it was announced that correspondence instruction would be provided free except for a $2 registration fee, through the International Correspondence school or other courses which might be developed, and that the army would pay half the cost of tuition and textbooks, up to $20, for each man electing courses offered by colleges and universities. The situation changed at the close of the year, but with the examples of the British and Canadian armies new plans were expected to be further developed.

At the opening of the academic year the offices of the American Association for Adult Education were moved to Teachers college, Columbia university, when the director of the association, Dr. Morse Cartwright, became the executive officer of the Institute for Adult Education. The association discontinued its emergency program for defense, and the publication of *Defense Papers, Defense Digests* and *Community Councils in Action* was ended. The series of *Studies in the Social Significance of Adult Education in the United States* was completed with the publication of the 27th volume. The Institute for Adult Education was established at Teachers college through a grant of $350,000 from the Carnegie Corporation of New York which had provided funds for the maintenance of the association since 1925. The institute was to be devoted to an intensive study of the opportunities, problems, materials and methods of adult education and the training of leaders and workers in the field. The association would be continued and would publish *The Adult Education Journal* as its membership organ in place of the *Journal of Adult Education*.

Progressive Education.—An informal committee appointed by the Progressive Education association issued a pamphlet (Bureau of Publications, Teachers college, Columbia university) under the title *New Methods vs. Old in American Education*. The pamphlet, a report on evaluation of newer practices in education, presented an analysis and summary of recent comparative studies. In the Summary of the Evidence the conclusion offered is that "the major researches show, in general, that where schools have adopted newer educational practices the children learn as much of the ordinary subjects as they would otherwise have learned. Sometimes they learn slightly less and sometimes slightly more, but the differences are small." The children in these schools "seem to be better adjusted both to their work and to social life when they graduate to other schools or to college." There is no loss in academic efficiency but "there is a definite gain in terms of initiative, skill in dealing with problems, knowledge of contemporary and world affairs, and social participation."

Similar conclusions were reached by the New York state department of education in its report of a survey of the activity program in New York city. Here it was also stated that "the balance in favour of the activity program is small" but might be increased "through improving the theory and practice of the activity program." The pupils tend, according to the report, to excel in co-operativeness, self-confidence, lack of subservience, creative abilities, self-discipline and scientific outlook. The state department recommended the extension of the activity program in the schools of New York city on a voluntary basis.

Critics of these reports continued to be skeptical about the methods of evaluation, while others did not feel that the small differences between the results of new and old methods were sufficiently compensated for by such blanket terms as initiative, resourcefulness, scientific outlook and so on.

Latin-American Relations.—The year saw a rapid extension of the interest in Latin-American relations under the leadership in particular of the U.S. Department of State's Division of Cultural Relations and the Office of Coordinator of Inter-American Affairs in the Office of Emergency Management (the original title of Office of the Coordinator of Commercial and Cultural Relations between the American Republics having been changed by executive order of July 30, 1941). The Division of Cultural Relations administered travel grants to distinguished leaders in the fields of education, literature, journalism, music, medicine, archaeology, art, etc., co-operated with private, professional and scientific organizations in developing inter-American activities; stimulated the interchange of educational motion pictures; and co-operated with the Office of the Coordinator.

On the educational side the Office of the Coordinator was concerned with the development of programs in the arts and sciences, education and travel, radio, press and moving pictures and operated through public and private organizations interested in strengthening hemisphere solidarity. In collaboration with the U.S. Office of Education the office was preparing materials and travel exhibits of aids to stimulate the teaching of Latin-American relations. It also undertook the preparation of new books, guides and bibliographies, the development of archaeological studies, the distribution of examples of American art, the support of cultural institutes in South America, and the establishment of an inter-American music centre. It was also interested in the use of radio, news, motion pictures and sports, and in co-operation in the fields of health, child welfare, social legislation and allied subjects.

The Institute of International Education in New York city, co-operating with these and other organizations in the U.S. and in South America, was active in arranging for the exchange of professors and students and in disseminating information on summer session and other courses. The institute administers the award of 20 Roosevelt fellowships each year.

Courses in inter-American relations were established in increasing numbers in high schools, colleges and universities throughout the United States, and in some institutions special Latin-American weeks were organized. One important result of these activities was the increase in the number of students taking up the study of Spanish and Portuguese.

In November, a conference of the American National Committees on Intellectual Cooperation was held in Havana and provided an opportunity for the exchange of views and expressions of solidarity in the interests of intellectual freedom.

Academic Freedom.—The *cause célèbre* of 1941 in the field of academic freedom and tenure was provided by Governor Eugene Talmadge in an attempt to seize political control over the system of higher education in Georgia. In June 1941, the governor announced the dismissal of Dr. W. D. Cocking, dean of the school of education of the University of Georgia, and of Dr. Marvin S. Pittman, president of the Statesboro Teachers college, on the charge of advocating co-racial education of whites and Negroes. President Harmon W. Caldwell of the university threatened to resign unless Dean Cocking was given a hearing before dismissal and was supported by the chairman of the board of regents. After a day's hearing the board of regents by one vote decided to retain Dean Cocking. The governor, insisting that he had "new evidence," demanded a second hearing and changed the membership of the board. The result was the dismissal of Dean Cocking, President Pittman and a dozen other members of the university system's faculty. Immediately the General Education board and the Rosenwald fund withdrew their financial support from the university; the Southern Association of Colleges and Secondary schools withdrew inter-

collegiate recognition of Georgia's degrees and credits; and the two leading institutions for higher education in the state were dropped from the Southern conference and the Association of American Universities. The American Association of University Professors was requested to investigate the situation. The pressure of these organizations and public indignation (90% of the daily and weekly, metropolitan and rural press was opposed to the governor's attempt to secure political control and introduce the spoils system in education) compelled Governor Talmadge in November to authorize the board of regents to review the case in order to restore the university to good standing with the accrediting agencies. (See *Bulletin of the American Association of University Professors*, Oct. 1941, pp. 466 ff., and *School and Society*.)

The revised statement drafted at the joint conferences of the Commission on Academic Freedom and Academic Tenure with the officers of the American Association of University Professors was endorsed by the Association of American Colleges at its annual meeting in Pasadena, Jan. 10, 1941. The statement of principles was based on the thesis that "the common good depends upon the free search for truth and its free exposition." Academic freedom includes both freedom in teaching and research and freedom in learning. "It carries with it duties correlative with rights." While entitled to freedom in the classroom to discuss his subject, the teacher should be careful not to introduce controversial matter which has no relation to it. "Limitations of academic freedom because of religious or other aims of the institution should be clearly stated in writing at the time of appointment." The teacher's special position in his community imposes special obligations, and, remembering that the public may judge his profession and his institution by his utterances, he "should make every effort to indicate that he is not an institutional spokesman."

On the subject of academic tenure the commission recommended permanent or continuous tenure after a probationary period of not more than seven years after appointment to the rank of a full-time instructor or higher rank. Notice of at least one year should be given prior to the expiration of the probationary period, if appointment is not to be continued. After permanent appointment, services should be terminated only for cause and after due hearing of charges. (See *Association of American Colleges Bulletin*, March 1941, pp. 124 f., and 127 ff.)

During 1941 the American Association of University Professors had 112 cases involving academic tenure referred to it, including the Western Washington College of Education, the University of Kansas City and Adelphi college.

At its annual meeting the American Federation of Teachers decided after a vote of its members to withdraw the charters of two local unions in New York city and one in Philadelphia for communist activities. Action was brought in Philadelphia against the A.F.T.'s decision.

The Rapp-Coudert committee, which was appointed by the New York state legislature to investigate the costs of education in the state but which concentrated its inquiries on subversive activities of teachers in New York city, completed its work at the end of the year by revealing the existence of a very small percentage of teachers in the colleges, an "irresponsible minority" according to President Harry D. Gideonse of Brooklyn college, and schools of the city who had been members of the Communist party, and the activities of certain youth organizations under communist auspices which existed in the high schools. The committee did not investigate fascist or nazi activities in the educational system.

The investigation of 600 school textbooks in social studies initiated by the National Association of Manufacturers in 1940 was brought to a conclusion early in 1941 by the publication of a volume of abstracts which purported to present subversive doctrines. It was announced that the analysis, made under the direction of Professor Ralph W. Robey, was purely objective and without bias. Nevertheless the publication aroused a storm of protest. Fourteen members of the staff of the Harvard University Graduate School of Education issued a statement on the danger of bias and misuse of the abstracts and at the same time approved of the action of lay groups like the National Association of Manufacturers if prompted by an interest "in the improvement of education and the preservation of the democratic way of life."

Round table discussions on "subversive textbooks" were held at the annual meeting of the American Association of School administration held in Atlantic City, where the School Book Publishers association also expressed its concern on the subject. The American Association of School Administrators and the National Education association (*q.v.*) organized a National Commission on the Protection of Democracy through Education "to investigate attacks and misunderstandings and prevent attacks due to misunderstanding on the schools by explaining the purposes and programs of public education." The American Federation of Teachers urged the National Education association to "make an objective study of the charges, and of the individuals and the organizations that make them, for the guidance of citizens and educators." The National Council for the Social Studies and the American Committee for Democracy and Intellectual Freedom were among other organizations which took action on the subject. One of the clearest statements on the subject was made by Professor Erling M. Hunt, editor of *Social Education*, who pointed out that the first newspaper reports of the N.A.M. statements seemed to suggest the work of an aggressive pressure group but when read in full they "imply a far more public-spirited interest in education." The National Association of Manufacturers in the end disclaimed responsibility for Dr. Robey's remarks on the investigation. (See *School and Society*.)

Education and Democracy.—The growing emergency, resulting finally in war, sharpened the issue between the ideologies of totalitarianism and democracy which had already been the subject of widespread discussion since 1939. More than ever the serious challenge of totalitarianism to democratic ideals and ways of life was recognized. The U.S. Office of Education made two important contributions to the subject—first in a bulletin "Expressions on Education by Builders of American Democracy," a revised edition of a bulletin published in 1913, and second in pamphlet No. 15 of the Education and National Defense series, "Education under Dictatorships and in Democracies."

The literature on the meaning of democracy and its implications for education was extensive. The Educational Policies Commission of the National Education association added another to its series of publications, all of which had an important bearing on the subject. The report on *The Education of Free Men in American Democracy* emphasized the urgent need of faith in and sensitiveness to the ideals of democracy and their development and of safeguarding the interests of all against the domination of private interests and groups. Bold and resolute action was demanded to meet "the rising tide of despotism" which "threatens the cause of human freedom with catastrophe." Totalitarianism with its disciplined party and its appeals to idealism and heroism exploits the very processes and virtues of democracy by utilizing human weaknesses, undermining social solidarity and creating confusion. American democracy is challenged to promote national unity by a clear definition of policy, principle and procedure in order that a greater measure of equality of security in economic condition and opportunity may be achieved and the general welfare and long-term interests of society may be safeguarded. To these ends bold, honest and dynamic leadership must be achieved. In contrast to trends which in recent years have rejected indoctrination and discipline, the report urged that the first duty of free schools in a democracy is to indoctrinate youth with loyalty to its ideals and to disseminate the knowledge necessary for free men. To these must be added discipline, for "without discipline, loyalties, however deep and abiding, can avail but little; without discipline, knowledge, however precise and comprehensive, must remain ineffectual and sterile. . . . To the champion of authoritarian rule discipline and authority are contradictory terms." The report discussed, further, the problems of freedom and control, and the relations of government, teachers and public to education on the principle that "political control over the processes of intellectual and moral development suggests the negation of freedom."

The publication of this report was followed by the issue by the Commission of a Study-Discussion outline for study clubs, public affairs forums, teachers' meetings and councils on education and defense, and a pamphlet on "Education and the Morale of a Free People." This was followed later by the publication of another pamphlet, prepared by the Oregon Committee for Implementing the Teaching of Democracy and the Commission, under the title "Uncle Sam Is Calling the Youth of the Nation," a special edition based on *The Education of Free Men in American Democracy* "for high school juniors and seniors to further their understanding of the basic tenets of democracy and the current threats to its continuance." The Oregon committee also published study guides for teachers and leaders of professional study groups, and, in co-operation with the Oregon Department of the American Legion, a pamphlet presenting "suggestions for developing and evaluating democratic procedures in the classroom and general school organization." This series is cited as only one example of a nation-wide movement to clarify the long-term significance of education for national defense.

The urgent need of the times is illustrated by the title of a book by Dean Benjamin Floyd Pittenger, *Indoctrination for American Democracy* (New York), which with its emphasis on indoctrination carries an implication of recent educational doctrines.

General World Movements.—The character of the all-out war was clearly illustrated by its effects upon education and upon the lives of young children of school age. During World War I neither the provision nor the progress of education was unduly disrupted. In World War II, there was no country in which children had not already been deprived of the normal services of education. While there was little information about the effects of the war on education in Germany, it was known that there had been wholesale evacuation of children from areas within the range of air attacks. There was available, however, ample information on the deliberate plans of the German invaders to keep the rising generations in occupied territories in ignorance and darkness. The treatment which was being meted out by the "master-race" varies; the principle was the same. In Poland and Czechoslovakia primary education was about all that might be provided; in the other occupied countries secondary schools, universities and institutions for the training of teachers might be kept open but under teachers who were quiescent and submissive, who used new textbooks adapted to preparing the young minds for the "New Order," and who were ready to accept nazi supervision. The distinction between the two groups seemed to be made on racial lines—one treatment for the non-Aryan Slavs and another for the Nordics who might perhaps some day be brought to see the light.

The universities everywhere suffered most; in the east they were generally closed; in the north and west they were tolerated but under careful supervision. Wherever opposition was voiced by students or faculty against the dismissal of professors or appointment of pliable servants of the "New Order" they were closed. Thus the University of Leyden was closed because the students protested against the dismissal of a non-Aryan professor. In all cases university and other libraries were censored, valuable collections destroyed, and others transferred to Germany together with valuable scientific equipment. The tragedy of higher education in the occupied countries was described in a series of articles in *The Times Educational Supplement* (Feb. 15–April 12, 1941).

For the displaced scholars who went to the United States the creation of a new *École Libre des Hautes Études*, to be affiliated with the New School for Social Research in New York, was announced at the end of the year. This addition to the University in Exile was expected to open its classes for the second semester of the academic year and to represent in America the spirit of independent scholarship and research temporarily driven from Europe by "barbaric Hitlerism."

From within nazi Germany the only reports were of reaction in education. Enrolments in the universities had already fallen from 83,000 in 1928 to 43,000 in 1937, and in the secondary schools from 823,000 in 1926 to 661,000 in 1938 even before the traditional nine-year course had been reduced to eight. These reductions clearly illustrate the acceptance of nazi opposition to intellectual training. Future leaders were being trained through the *Adolf-Hitlerschulen* and the *Nationalpolitische Erziehungsanstalten* (*Napoli*). The clearest evidence, however, that the masses were to be kept in intellectual subjection was provided in the new system of preparing teachers for the elementary schools. The system introduced during the Weimar Republic which placed teacher preparation on a university

basis was discarded and replaced by one which would recruit candidates at the age of 14 from a new type of higher primary school (*Hauptschule*) and train them in small institutions for five years. This represented a return to a system against which German teachers had been protesting for 100 years. (See *Educational Forum*, Nov. 1941, pp. 69 ff., and G. Ziemer, *Education for Death*, Oxford University press.)

Education in occupied France was disrupted just as in other occupied countries, while in unoccupied France the forces of reaction seized upon the educational system to develop new loyalties to the new state. Religious instruction was restored; denominational teaching orders were permitted to return; an end was put to the common school (*école unique*) movement which held out a promise of increased educational opportunities; women were dismissed from teaching positions; textbooks were being revised in the interests of collaboration; the normal schools, regarded as seed-beds of revolutionary movements, were closed and replaced by a system of teacher training likely to draw candidates from a more politically reliable stratum in society; and teachers' associations were abolished in favour of a single organization more amenable to control. Finally, more attention was being devoted to physical education. (See *School and Society*.)

England presented a far more encouraging picture. After the comparative failure of the evacuation schemes, the full machinery of the scheme was again brought under control. Special care was devoted to the health of children by additional funds for the provision of meals and especially milk, through the school medical services with special inspection of children reported as suffering from war strain, and through the organization of increased day nurseries and nursery schools both in reception areas and near munitions factories where mothers were employed. As in World War I, new educational adaptations and experiments were being tried out. Above all was the universal recognition of the "wonderful services rendered by the teachers at times of acute crisis and danger," to quote a former president of the board of education, in addition to the heavy burden of school work under difficult conditions—civil defense work, auxiliary fire service, home guard, canteens and rest centres, billeting of pupils, provision of clothing and work with out-of-school youth.

In March 1941, the estimates of the national board of education in Great Britain for the ensuing year showed an increase of £2,250,666 over 1940 (£54,915,639 for 1941 as compared with £52,664,973 for 1940).

The universities were the greatest sufferers; faculties were drawn off for public services; student interests were shifted; and finally changes in the draft age might prevent students of university age from spending even one or two years in the universities. (*See* also CAMBRIDGE UNIVERSITY; LONDON UNIVERSITY; OXFORD UNIVERSITY.)

Initiated in 1939–40 the "Service of Youth" spread throughout Great Britain to organize and satisfy the interests of out-of-school youth through a combination of voluntary and public initiative and effort. Working under a National Youth committee and co-operating with the board of education and local education authorities, youth committees were everywhere established to promote social, recreational and educational activities for youth, but on a voluntary basis and without any effort at uniformity and regimentation.

For soldiers in the army an extensive system of adult education was organized under an Army Educational corps with a full-time civilian director and staff. In each unit an army officer was designated as the unit education officer whose business it was to discover and meet the demands, which so far showed an interest in foreign languages, sciences, economics, architecture, engineering and history. Since there was a widespread interest in current affairs, lectures were organized in this field and were given during the regular hours of training.

The problems of education in the postwar period were not ignored. Books and articles already appeared on the subject; the number of groups and committees studying it was extensive. The general lines of future development included increased provision of nursery schools; extension of compulsory full-time education at least to 15 and part-time to 18; a redefinition of secondary education; changes in the grant system and in educational authorities; the incorporation of the Youth service in the general system; and greater extension of educational opportunity up to the university. One important innovation was launched; there was a widespread movement to give instruction in the history of the United States in all schools. (See *The Times Educational Supplement; The Schoolmaster and Woman Teacher's Chronicle;* and *The Journal of Education.*)

Education Association, National: *see* NATIONAL EDUCATION ASSOCIATION.

Edwards, Agustín (1878–1941), Chilean statesman and publisher, was born June 17 in Santiago, Chile. A descendant of a British naval officer and member of a prominent Chilean family, Edwards became minister of foreign affairs in Chile at the age of 25. He held this post from 1903 to 1910. He subsequently was minister to Italy, Spain and Switzerland, 1905–06; to Great Britain, 1910–25; and he was ambassador to Great Britain, 1935–38. He was elected vice-president of the League of Nations assembly in 1921, president in 1922 and he served as president of the league council in 1936. Edwards was a member of the Chilean parliament from 1900 to 1910 and was vice-president of the chamber of deputies from 1901 to 1902. He was also publisher of a number of Chilean newspapers and magazines as well as president of the banking house of Edwards and company. He died at his home in Santiago, June 18.

Eggs. Wartime demand and the United States government's activity in stimulating increased production of food for defense and in buying eggs for shipment to Great Britain resulted in a new record production of eggs in the United States in 1941. Production for the year was estimated by the department of agriculture as 40,712,000,000 eggs—5% more than in 1940, 12% more than the ten-year average production, and 4% more than the previous record year of 1930, when there were approximately 1% more laying hens on farms than in 1941. Egg prices began the year below average, but under the stimulus of government buying for export, prices rose from a low of 15¾ cents per doz., in the Chicago Mercantile Exchange wholesale market in Feb. 1941, to the highest price since 1929. By early Nov. 1941, the Surplus Marketing administration was paying as high as 39¾ cents per doz. for fresh eggs to export to Britain. In the government's effort to induce increased production of concentrated foods for export, the output of dried eggs in the United States in 1941 was estimated at about 40,000,000 lb., about four times the previous highest production, that of 1939. (For exports of eggs under provisions of the Lend-Lease act, see FARM INCOME.) During 1941, up to Dec. 20, the government bought the equivalent of 7,750,000 cases of eggs (30 doz. eggs to the case). Trading on the country's largest futures market in eggs, the Chicago Mercantile Exchange, was the largest in volume since 1925 and totalled 54,530 trading units, or cars, amounting to 654,360,000 doz. In Sept. 1941, the secretary of agriculture announced that the government would support egg prices at not less than 85% of parity through Dec. 31, 1942. At the opening of the market Dec. 8, following the attack on Pearl Harbor, the Chicago Mercantile Exchange for the first time in many years clamped price restrictions on trading in eggs and limited the maximum variation in prices to two cents a doz. in any one day. This action was to prevent excessive speculation and anticipated the wartime control policies of the U.S. Commodity Exchange administration in maintaining stable markets for commodities important to defense. The price restrictions were apparently necessary for only three days.

For many years imports of dried eggs from China had been the source of much complaint from United States egg producers. That competition practically disappeared in 1941. Imports from South America, however, caused some concern among producers. These imports were reported by the trade at about 310,000 cases; partly from Brazil but mainly from Argentina. The U.S. department of agriculture asked, in Sept. 1941, for a production of 4,000,000,000 doz. eggs in 1942, but later raised this figure to 4,200,000,000 doz. (*See* also POULTRY.) (S. O. R.)

Egypt. An independent kingdom of northeast Africa; bounded N. by the Mediterranean, S. by the Anglo-Egyptian Sudan, N.E. by Palestine, E. by the Red sea, W. by Libya and the Sahara. Area *c.* 383,000 sq.mi. (arable land 13,600 sq.mi.); pop. (June 30, 1939), 16,522,000. Chief towns (pop. 1937): Cairo (cap., 1,307,422); Alexandria (682,101); Port Said (126,907); Tanta (94,421); Mansura (68,637); Damanhur (61,791); Asyut (59,925). Ruler, King Farouk I; premier, Hussein Sirri Pasha; language, Arabic; religion, Mohammedan 91%, Copt 7%.

History.—When the year 1941 opened, the Italian forces which had advanced into Egypt had already been ejected from Egyptian territory as the result of the British offensive begun at Sidi Barrani early in December. With the fall of Bardia early in January and of Bengasi on Feb. 6, military threats to Egypt seemed definitely to have been removed. But German troops appeared in North Africa and were encountered at Agheila, south of Bengasi, as early as the end of February. Their strength proved too great for the British forces available; Bengasi had to be abandoned early in April and by the end of that month the enemy

was back on Egyptian soil at El Sollum. No further advance however, was made, and with Tobruk remaining in British hands the position was stabilized. Then, with the second British attack on Libya launched Nov. 18, the threat of invasion to Egypt appeared quite remote at the end of 1941. However, the capture of Crete at the end of May made it easier for the enemy to launch air attacks upon Egypt. Comparatively innocuous air raids in January and February gave place in June to two heavy raids on Alexandria in which upwards of 500 casualties were reported; in August there were raids on the Suez canal area in which casualties were also substantial; and in September a raid was made on the outskirts of Cairo. Up to the end of the year the city itself had not been attacked. After the raids on Alexandria the prime minister, Hussein Sirri Pasha, announced a gift by the British government of £E1,000,000 to be spent on improving air-raid precaution measures in Cairo, Alexandria and other towns. In May the Egyptian steamer "Zamzam" was sunk by a German raider, which, however, took off the passengers and crew.

The operations in Syria which led to the overthrow of the Vichy regime there and to the removal of German and Italian influence, and in a less degree the operations in Iraq, had far-reaching effects on Egypt, because they rendered secure its eastern frontier, the threat to which was becoming apparent.

In domestic politics, attempts were made to form a government on a national basis by including in the cabinet members of the parties in opposition, but the efforts were not entirely successful, as it was not possible to overcome the objections of the Wafdist party. Nevertheless at the end of July Hussein Sirri Pasha formed a new government which included members of the Saadist party under the leadership of Ahmed Maher Pasha, who had been unwilling to join the cabinet earlier in the year because he thought that more active participation in the war was the right policy for Egypt to pursue. Foreign commercial interests in Egypt felt some alarm at what they considered to be hostility to the foreign community in certain measures taken by the chamber of deputies. Among these were proposals to oblige firms to keep accounts in Arabic and to maintain a fixed proportion of Egyptian employees on their staffs. The prime minister in the chamber emphasized that there was no hostility to the foreign community on the part of the government, but pointed out that Egyptians must be free to establish their own position in the commercial arena. At the close of the year the measures which gave rise to these remarks were being reconsidered by the government. Advantage was taken of Anthony Eden's visit to Egypt in March to discuss topics of mutual interest to Great Britain and Egypt. In August the prime minister announced that an agreement had been made with the British government whereby the British and Egyptian governments would buy the cotton crop at the same prices as the British government had paid in 1940.

In February Robert Menzies, prime minister of Australia, was welcomed at a press meeting as being the first dominion prime minister who had ever visited Egypt. (B. H. B.)

Education.—(1938–39): Elementary and secondary schools 4,065; scholars 1,064,209; colleges 8; scholars 1,980; Fuad I university: scholars, male 8,393; female 7,043; foreign schools (1936–37) 410; scholars 76,750.

Banking and Finance.—Revenue (est. 1940–41) £E47,718,000; expenditure (est. 1940–41) £E45,818,000; public debt (May 1, 1939) £E94,614,360; reserve from budget surpluses £E33,062,569; notes in circulation (March 31, 1941) £E37,500,000; gold reserve (March 1941) £E6,300,000; foreign assets reserve £E32,900,000; exchange rate (£E1=100 piastres): (average 1940) £E1=393.2 cents; July 1941: £E1=414.1 cents.

Trade and Communication.—External trade (merchandise): imports (1938) £E36,954,373; (1939) £E34,091,716: exports (1938) £E29,342,485; (1939) £E34,080,913. Communications and transport, 1938: roads, main 1,240 mi.; secondary 3,430 mi.; railways, state 3,537 mi.; agricultural 876 mi.; shipping (1939) 110,000 tons gross; entered ports 35,390,325 tons gross; passed through Suez canal 25,827,977 tons gross; motor vehicles licensed (Dec. 31, 1938): cars 29,382; commercial 4,074; cycles 2,051; wireless receiving set licences (Dec. 31, 1938) 78,823; telephone instruments in use (April 30, 1938) 59,922.

Aerial Navigation in Egypt (1938)

	Misr Airways Company	Imperial Airways Ltd.	"K.L.M." Royal Dutch Air Lines
Passengers	18,559	6,056	2,450
Freight and baggage (Kg.)	63,828	114,189	45,140
Mails (Kg.)	16,435	1,482,130	131,851
Miles flown	1,011,104	6,967,935	2,795,180
Regularity of service	98.1%	90.9%	98.2%

Agriculture and Minerals.—Production 1939 (in metric tons): cotton, ginned 390,500; maize 1,522,300; wheat 1,333,800; rice 887,800; petroleum 666,000; natural phosphates 547,000; cane sugar, refined 159,800; barley 238,200; ground-nuts 16,600. (*See* also ANGLO-EGYPTIAN SUDAN.)

Eidmann, Frank Lewis (1887–1941), U.S. educator, was a leader in automotive and aviation engineering. Born Dec. 20 in Kingston, N.Y., he studied mechanical engineering at the Stevens Institute of Technology, where, after graduating in 1909, he worked in the institute's laboratories. He was associate professor at Princeton university, 1923–30, and was professor of mechanical engineering at Columbia from 1931 until his death. Prof. Eidmann designed parts for some of the first farm tractors made in the U.S. In later years he specialized in design and construction of timing devices. He died in New York city, Sept. 4.

Eire. Eire is the southern portion of an island to the west of Great Britain, extending from 51°26′ to 51°21′ N., and from 5°25′ to 10°30′ W. Under the constitution, operative since Dec. 29, 1937, the name "Irish Free State," given by the treaty of 1921 to the 26 counties and four of the county boroughs of southern Ireland, was replaced by that of "Eire," or Ireland. President: Dr. Douglas Hyde (*de h-Ide*). National flag: the tricolour of green, white and orange.

Area and Population.—Area 26,601 sq.mi.; pop. (est. June 30, 1939) 2,934,000. Chief towns (pop. census 1936): Dublin (cap., est. 1939, 482,300); Cork (80,765); Limerick (41,061); Dun Laoghaire (est. 1939, 40,600); Waterford (27,968). Languages: Irish and English; religion: Christian (Roman Catholic 93%).

History.—On Nov. 7, 1940, Prime Minister Eamon de Valera stated in the Dáil that it was his policy to promote good relations with Great Britain. In no circumstances would he allow Eire to be used as a base for attack on that country. He categorically denied reports that submarines were being fuelled or provisioned from Irish coasts. There could be no question of the ports being handed over as long as Eire remained neutral, and attempts by either side to put pressure on Eire would lead only to bloodshed. In his Christmas eve 1940 broadcast to the Irish in the U.S.A. the Taoiseach spoke of a publicity campaign in America for the seizure of the Irish ports, and said that any attack would be met by force. He asked U.S. help to procure weapons and food. On Jan. 17, 1941, Sean F. Lemass announced that nine ships under the Irish flag had recently been sunk off the coast. On March 8, Frank Aiken flew to the U.S.A. to purchase arms and supplies, returning at the end of June. During Aiken's visit President Roosevelt gave permission for the purchase of two ships. Five others were bought afterward and an Irish shipping company formed. Later President Roosevelt said that no munitions would be supplied except to active belligerents.

On July 17, James Dillon in the Dáil called for the abandonment of neutrality and co-operation with Britain and the U.S.A., but his plea was repudiated by his own leader.

A special session of the Dáil was called on May 26 to discuss the proposed introduction of conscription in Northern Ireland. De Valera, with whom other leaders agreed, said that the proposed step would undo the goodwill prevailing between Eire and Great Britain. Though his interference was denounced by John M. Andrews, the proposal was dropped, Prime Minister Churchill hav-

ing declared that it would not be worth the trouble it would cause.

Serious damage was done in Dublin by bombs dropped near Clontarf from a German plane on May 31. Thirty-four people were killed and more than 80 were badly wounded.

Owing to the shortage of imported supplies, tea, cocoa, coal, gasoline and paraffin products were severely rationed and the extraction-percentage in flour was raised to 95. Strenuous efforts raised food production to the greatest recorded volume, and resulted in the largest wheat crop since 1846, but a protracted outbreak of foot-and-mouth disease greatly hampered the livestock trade. (M. T.)

Education.—In 1939–40: elementary schools, 5,114; scholars, 464,108; secondary schools, 345; scholars, 37,670; universities: National, 3,987 students; Trinity college, Dublin, 1,438.

Banking and Finance.—Revenue, ordinary (1940–41), £34,638,000; (est. 1941–42) £36,264,000; expenditure, ordinary (1940–41), £37,772,030; (est. 1941–42) £40,172,000; public debt (March 31, 1941), £48,243,173; notes in circulation (Aug. 10, 1940), £18,980,262; gold bullion (March 31, 1941), £2,601,685; reserve, British bank securities (March 31, 1941), £10,121,265; exchange rate (1941), £1 = about $4.03.

Trade and Communication.—Foreign trade (merchandise): imports (1940), £46,790,207; exports and re-exports (1940), £32,966,406; roads, main (1938–39), 10,000 mi.; secondary, 38,000 mi.; railways, total track mileage (1940), 2,493 mi.; shipping (1940): vessels, 532; net tonnage, 30,253; motor vehicles licensed (Aug. 1941): private cars, 31,780; other vehicles, 24,128; wireless receiving set licences (1939–40), 169,622; telephones, installations (1939–40), 27,387.

Agriculture, Manufacturing, Mineral Production.—Production 1940 (in metric tons): oats, 736,000; wheat, 317,900; potatoes, 3,168,200; barley, 141,100; beet sugar, 94,000; coal (1939), 120,000; wool (1940), 7,586. Agriculture and fisheries, net output (1939–40), £51,800,000; industry, net output (1939), £27,121,000. Number of insured workers (1939–40), average, 432,127; number of unemployed, average, 84,054.

Industrial Production Census in Eire (preliminary figures) 1939

Industry or Trade	Gross output £	Net output £	Persons employed
Bacon curing	6,556,636	926,279	2,543
Boots and shoes	2,024,145	938,086	5,644
Brewing	7,923,440	6,646,033	3,759
Hosiery	1,305,986	649,522	5,025
Shirt making	468,242	209,066	2,154
Sugar and confectionery	4,210,252	1,670,281	4,917
Textiles	3,117,488	1,113,350	6,699
Tobacco	7,676,129	1,515,231	2,449
Vehicles	2,090,736	898,341	3,505

NOTE: Industrial output in 1939 related to the 35 industrial groups which comprise all descriptions of "transportable goods." It excludes all particulars in respect of laundry, dyeing and cleaning, building and construction, utilities (gas, water and electricity), work carried out by transport companies (canals, docks, harbours and railways) or by local authorities and government departments. It also excludes the output of very small industrial concerns included in figures for previous years.

Elections.

Although 1941 was an off year for elections, it was not without political activity or interest. Neither in the elections regularly scheduled nor in those specially called to fill vacancies in the two houses of congress was there clear evidence of any significant party trend in politics. But factional conflicts were lively and in several instances local attitudes toward the world situation were reflected.

The unfinished business of Missouri's contested 1940 election was closed on May 21, 1941, by the state assembly's recognition of Forrest C. Donnell (Republican) as governor. A somewhat different type of contest had meanwhile developed in West Virginia, where the retiring Governor Homer A. Holt and the incoming Governor Matthew M. Neely both claimed the right to name a successor to the latter's unexpired term in the United States senate. Governor Holt, on Jan. 12, the last day of his administration, designated Clarence E. Martin to become senator "upon the occurrence of a vacancy." Neely countered this move by withholding his resignation from the senate until 12:01 A.M., Jan. 13, having himself sworn in immediately afterward, and then promptly appointing Joseph Rosier. The legal and political implications of this case furnished the subject of a three-day debate in the senate, which finally decided by a close vote in Rosier's favour.

The only regular election of 1941 to arouse much national interest was that for mayor of New York city. Early in the spring it became apparent that Mayor Fiorello La Guardia, in spite of previous indications to the contrary, would not be averse to a third term if he were solicited by a sufficient number of voters. Movements accordingly got under way to "draft" him as a candidate on the Fusion, American Labor and Republican tickets. A proposal of some New Dealers to enter his name in the Democratic primary was dropped at his own desire, since it was felt that if he were not opposed the independent voters would fail to turn out in sufficient strength to return his board of estimates.

La Guardia's nomination by the Fusionists was never in question. The American Labor party, however, was at first sharply divided between its state organization or right wing, which favoured the mayor on all counts, and its New York county organization or left wing, which denounced him for his treatment of the transit workers and more particularly for his approval of President Roosevelt's foreign policy. On June 16 this left wing promised to offer a definitely antiwar candidate. But the invasion of Russia soon caused it to reverse its position and to line up with the right wing in strong advocacy of La Guardia's re-election.

In the Republican primary the mayor was supported by most of the party leaders. John R. Davies, former president of the National Republican club, entered the field against him on the ground that he was not a regular or dependable member of the party and that he was known to have strong interventionist opinions. But La Guardia was nominated by a large majority in a light poll.

The Democrats in the meantime, having canvassed their possibilities, fixed without important dissent upon William O'Dwyer of Brooklyn. And the Socialists, with a platform emphasizing their disapproval of American participation in the war and their disappointment with the reforms and public improvements of the city administration, selected as their candidate Dr. George W. Hartman of Teachers' college.

In the campaign that followed, the Democratic candidate was actively supported by National Chairman Edward J. Flynn and former Chairman James A. Farley, while La Guardia had the endorsements of Thomas E. Dewey, Wendell L. Willkie and President Roosevelt. The mayor stood

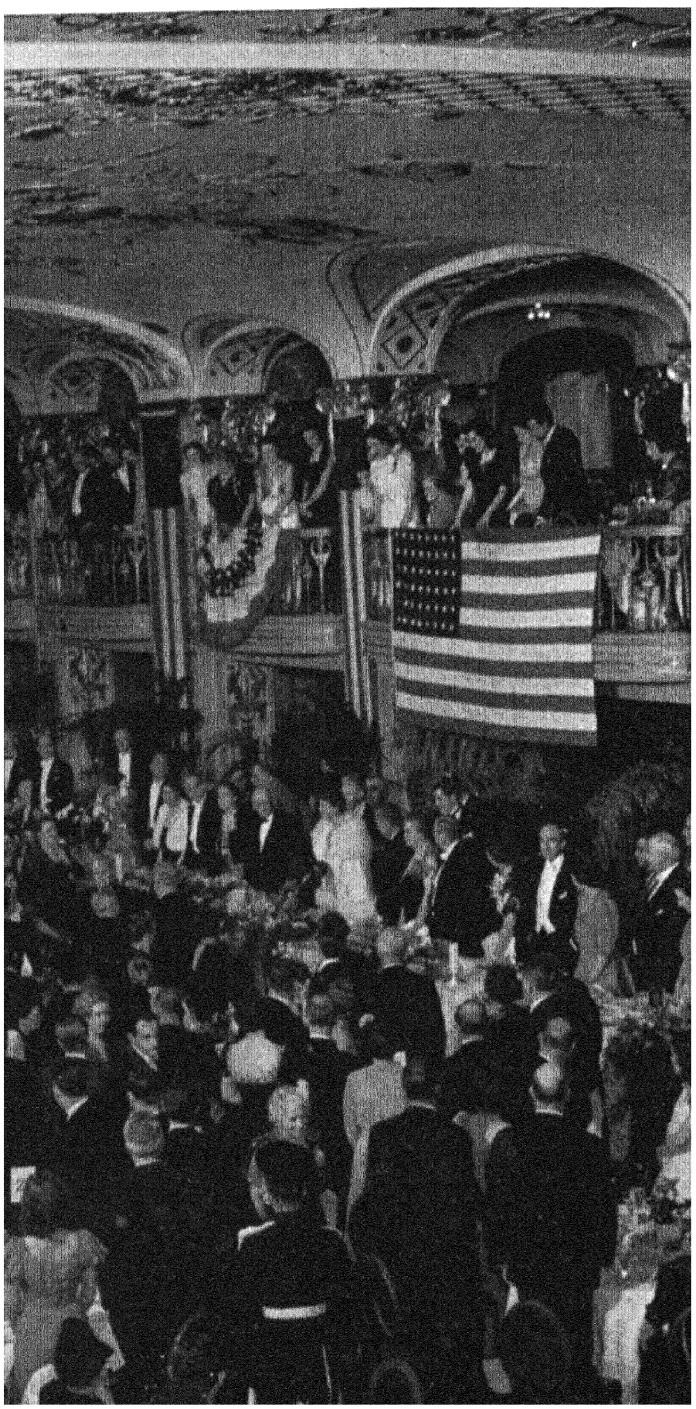
EIRE PAID TRIBUTE on Easter Sunday 1941 to its dead heroes of the Easter Week rebellion of 1916 by staging a mammoth parade in Dublin and placing floral bouquets under glass jars near the grave of Michael Collins

upon his record of clean and efficient government. The Democrats charged that he had been extravagant and sought to prove that he was in alliance with communists. They generally avoided the question of international relations although they did foster the criticism that La Guardia in accepting the position of Civilian Defense director and continuing in office as mayor had undertaken more than he could properly handle. And efforts were made to muddy the waters of argument with the charge that he had not dealt firmly enough with anti-Semitic demonstrations in the city. But the most effective assault upon his entrenched political position came during the last two weeks of the campaign when in one of his speeches he made certain derogatory comments, which were construed by the Democrats to impugn the honesty of Governor Lehman and of the State court of appeals. La Guardia repudiated any such meaning in his words, but the damage was done. For when the votes were counted, he was found to have carried the election by a majority of only about 52% (1,186,394 votes to 1,052,553 for O'Dwyer and 24,145 for Hartman).

The special election of 1941 that caused most widespread interest was that held by Texas in June to choose a successor to the late Senator Morris Sheppard. In this election no clear issue was developed other than that of the personalities involved. There were four major candidates: Governor W. Lee O'Daniel, Representative Lyndon B. Johnson, State's Attorney General Gerald Mann and Representative Martin Dies. President Roosevelt expressed a preference for Johnson. But Governor O'Daniel carried the election by a plurality of 1,311 votes over Johnson, with Mann running third and Dies fourth. Dies later attributed his defeat largely to the efforts of "C.I.O. and fifth column organizations" and charged that there had been wholesale violations of the Hatch act.

Other senatorial vacancies were filled during 1941 by election or appointment in the states of Arkansas, Mississippi and South Carolina without altering the party balance. Representatives were elected for the 6th district of Maryland; the 2nd district of Mississippi; the 14th, 17th and 42nd districts of New York state; the 7th district of Oklahoma; the 15th district of Pennsylvania; the 2nd district of Virginia; and the 1st district of Wisconsin, with the result of a net gain of two seats for the Republicans.

The only regular gubernatorial election of 1941 was in Virginia where Colgate W. Darden, Jr., carried the Democratic primary and the final election by preponderant majorities. (*See* also DEMOCRATIC PARTY; PROPORTIONAL REPRESENTATION; REPUBLICAN PARTY; UNITED STATES; and under various state articles.) (G. P. BA.)



THE ELECTORAL COLLEGE'S first plenary meeting in U.S. history took place at Washington, D.C., Jan. 19, 1941, the night before Pres. Roosevelt's third inaugural

Electrical Industries. The year 1941 in the United States was a superlative period in the electric utility business in almost every respect except earnings. These, because of heavier taxes and increasing operating costs for a very large number of companies, showed a reduction from the previous year in spite of a large gross.

Total generation of energy in 1941 was 168,000,000,000 kw.hr., twice the production in 1933. The increase over the previous year was 23,000,000,000 kw.hr. This increase is more than 50% greater than the growth in any previous year.

For the first time in years the net imports from Canada fell below 1,000,000,000 kw.hr., amounting to approximately 900,000,000.

The generating capacity to produce this energy by the end of 1941 amounted to 44,350,000 kw., which was an increase in the 12-month period of 2,700,000 kw. Steam generation accounted for 31,000,000 kw., internal combustion was 1,000,000 and hydro the remainder. The ratios of the several types of prime mover to the total remained approximately the same as in 1940, namely, steam 70%, hydro 28% and internal combustion 2%.

Of the total, 16% was publicly owned, divided about equally between municipal and the federal government. The amount of government generating capacity, both through construction and acquisition, increased nearly one-third in the year, municipal only 6%. The construction planned for 1942 would, if completed, increase the government-owned plant again by one-third.

The statistics show but one state to have no public ownership, Rhode Island. Nearly 80% of the municipally owned generating capacity lies in three sections: east north central, 784,200 kw.; west north central, 601,500 kw.; and Pacific, 917,600 kw.

Governmental projects in 1941 were operating in 34 states. In Tennessee the generation was almost entirely government-owned TVA. In Nebraska public generating capacity (both municipal and government) was approximately 64% of the total; Alabama, 45%; Mississippi, 50%; Wyoming, 56%; Arizona, 80%; Nevada, 98%; Washington, 51%; Oregon, 44%; and California, 22%. Approximately 40% of the publicly owned generating capacity lay east of the Mississippi and 60% west.

The new generating capacity added during 1941 was distributed all over the country; only one state, Delaware, having no additions. The heavy additions occurred in the heavy industrial and mineral producing areas, reflecting defense requirements: New York with 275,000 kw., Illinois with 243,000 kw. and Ohio with 210,000 kw. were the largest contributors to more generating capacity.

Fuel generation accounted for 69% of the energy output in 1941 and hydro 31%. In the previous year the hydro ratio was 33%. While part of this drop was due to the drought all along the eastern seaboard, the more important cause of this relative position change was the increasing hours of factory production in the steam plant areas. The average hours use of steam generating plant in 1941 increased by nearly 15% to over 3,700 hr. The best predepression year was 1929, with less than 2,700 hr. Hydro also increased hours of use, exceeding for the first time an average of

more than half the hours in the year. Combined, the hours use of all generating capacity averaged slightly over 3,900 hours.

Lack of rainfall east of the Mississippi reduced the amount of hydro energy and in the southeast brought about a system of rationing for a short period in the early summer and again in November of 1941. Timely arrival of rains prevented a similar occurrence in New England late in the year. The situation in the southeast was further aggravated by the rapidly increasing production of war-needed aluminum. The entire southern area was called on to share the burden of making up the deficiency. Power-pooling on an area basis had been discussed before, but this was the first time it was put into effect.

Energy sales for 1941 were slightly in excess of 140,000,000,000 kw.hr., an increase in the year of nearly 22,000,000,000, or 18.3%. The greatest gain came from large industrial customers, who took 28% more than in 1940, for a total of over 76,000,000,000 kw.hr. While this class of customer accounted for 54% of all sales in 1941 against 50% in 1940 there was still some room to go before the predepression ratios were exceeded. In 1929, for instance, the industrial sales amounted to 57% of the total.

Nevertheless, the industrial load was the one that dominated the economics of the period, accounting as it did for nearly three-quarters of the increased sales in 1941. Small commercial sales, which include sales to small factory customers, took a spurt and came very close to residential sales. The two were: commercial, 24,700,000,000 kw.hr., residential 25,000,000,000 kw.hr. In fact, residential sales showed a deceleration in 1941. They were still ahead by nearly 8%, but the rate of increase of previous years was not maintained. Rural sales took a leap of 18% in 1941 from just under 2,000,000,000 to 2,350,000,000 kw.hr. This was caused primarily by the addition of over 300,000 new rural customers. Street and highway lighting sales continued their upward trend largely because of new projects. Whether this trend would continue in 1942 was a question, because of air-raid precautions.

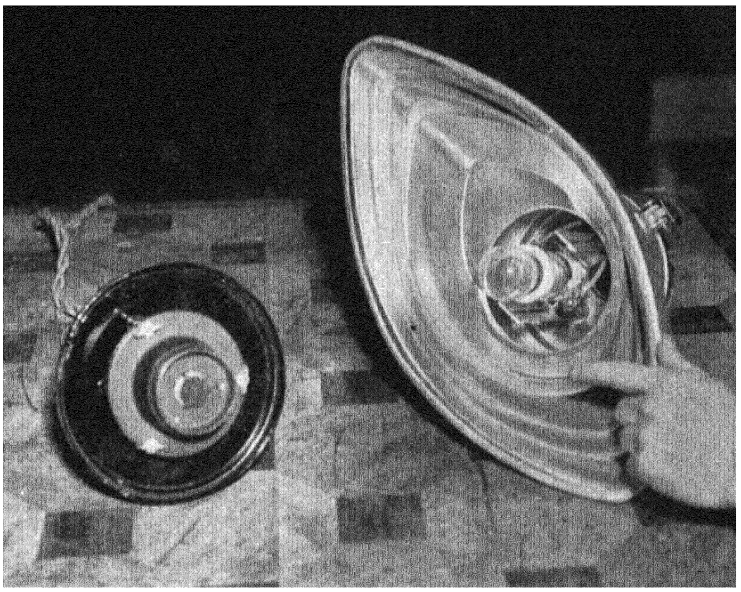
Improved financial condition of workers was reflected in an increase of more than 1,000,000 residential customers. The added rural and other classes of customers brought the total at the close of the year to 31,500,000 customers, an increase of 1,350,000, the greatest since the days of old house-wiring campaigns in 1926. The number of families taking electric service in the United States in 1941 was approximately 27,000,000, or 76% of all the families in the country.

Decreases in electric rates were not as numerous as in the preceding five years, although some of the reductions were among the largest ever made. The average rate, however, continued to fall, due largely to increased usage in the lower-rate brackets. In 1930 the average price per residential kilowatt-hour was 5.78 cents. In 1940 it was 3.84 cents and in 1941, 3.73 cents. Average residential usage crept up from 952 kw.hr. in 1940 to 986 kw.hr. in 1941. The increase during the depression decade had been approximately 400 kw.hr. per householder.

Financially, the results of 1941 operations were not so good. In spite of an increase in gross revenue of almost 10% ($213,000,000) the net after interest and taxes was around 2% less than in 1940. Taxes jumped $100,000,000 to something over $500,000,000 and took just 20½ cents out of every dollar of revenue. Taxes in 1941 exceeded payrolls and were greater by 40% than combined bond interest and preferred dividends.

New financing was the lowest since 1937, amounting to approximately $700,000,000 against $958,000,000 in 1940. Only $110,000,000 was for new financing in 1941.

Construction expenditures were substantially below the amount budgeted Jan. 1, 1941. The amount spent was some $600,000,000, with a slightly higher amount budgeted for 1942. Just as 1941 expenditures were limited by priorities, so the figures for 1942 were predicated on securing permission to build.



COMPARISON of British (left) and U[illegible]nalres for blackout lighting of streets and sidewalks. The British unit uses a 25-watt incandescent lamp, whereas the U.S. unit has a shielded 2½-watt gaseous lamp and utilizes available light; it provides visibility of about 25 ft. but cannot be seen more than a few hundred feet above the ground. The first U.S. test of blackout lighting was conducted May 14, 1941 at Lynn, Massachusetts

The total generating capacity added in 1941 was 2,980,875 kw., and scheduled for future years was—1942, 3,618,404 kw.; 1943, 3,341,695 kw.; 1944, and later, 1,250,000 kw. Transmission lines exceeded the estimate of 1940 by nearly 50%, some 9,000 mi. having been erected during 1941, with another 9,000 mi. projected for 1942. This construction reflected both the physical integration of holding company properties and the sectional power-pooling mentioned earlier. Likewise, the erection of substations was increased from the first of the year (1941) estimate by 50%. Six and a quarter million kva. of substations went up in 1941 and 6,600,000 kva. was scheduled for 1942. Distribution construction to serve the retail customers was down and was expected to stay down until war demands had been filled and materials were again available.

Of the large steam turbines ordered during 1941 60% were hydrogen cooled, over 45% had 850-lb. pressure, 55% 900° F. and 77% would operate at 3,600 r.p.m. No units below 20,000 kw. would be hydrogen cooled. No superposed units above 25,000 kw. were purchased in 1941, over 90% of all units being for condensing operation.

Manufactures in 1941 exceeded 1929 in production for the first time. With an increase over 1940 of nearly 75%, total production, including turbines, appliances, lighting equipment and electrical equipment and supplies, exceeded $4,000,000,000. Employment in electrical manufacturing plants was up 42% in the year. Appliance sales were up 40% and refrigerators up 56%, general electrical materials up 79%, industrial apparatus up 90%, wire and cable up 90% and transmission and distribution equipment up 60%. Sales of 3,500,000 electric refrigerators and 750,000 electric ranges were all-time highs. Limitation of materials would make it impossible to again reach such volumes until after the war.

Lighting. Fluorescent lighting was responsible in 1941 for a greater advance in illumination levels than in any previous year. Over 600 installations, covering more than 3,000,000 sq.ft. of floor space were reported, with intensities in excess of 50 ft.-candles, 85% of these being lighted with fluorescent lamps. In new plant construction from 30 to 50 ft.-candles maintained-in-service was the rule in 1941.

Production of large lamps was estimated to reach 740,000,000 units, an increase of 146,000,000 in the year. Of this total, fluorescent would account for around 22,000,000 tubes, an increase of 300% during the year. In spite of the rapidity of growth of tube lighting, the filament output continued to increase by almost record-breaking figures.

The trend in wattage sizes in filament lamps in 1941 was toward the larger sizes. In the 200- to 1,500-watt group, the increase was 25%, while in the 7½- to 50-watt group it was but 6%. In fluorescent lighting the 40-watt lamp was out in front, absorbing between 50% and 60% of the output, 20 watts was next at about 20%. The daylight fluorescent, which at first was expected to lead the demand, ran a poor second. White was first at nearly 60% of demand and daylight at 30%.

High-tension fluorescent lighting gained considerable headway during 1941. While still used very largely for decoration, a straight tubing in 4-ft. and 6-ft. lengths was developed for utility lighting. Advantage was higher efficiency in light production.

There was little new in general filament lighting practice during 1941. In fluorescent a great many better-designed equipments came on the market and some trends became apparent. Probably the most noticeable was the line of light in troffers. Several adaptations of this appeared, designed to reduce glare discomfort for those in the line.

Greater attention was given to shielding the light sources by means of special glass or of plastics. There were also developed lens units for directional lighting with fluorescent sources.

The greatest handicap encountered was the loss of aluminum because of defense requirements. Resort was made to aluminum paints and other bright metals. As the year 1941 was closing, shortages in other metals and some plastics used in fixture manufacture were requiring the industry to seek out other substitutes. The newer baked-paint finishes appeared to be looming up as a competitor to porcelain enamel.

Paint took on an added significance in lighting through research into the contrast values of certain colours on machinery under artificial lighting. The studies indicated increased speed in production and greater safety would result from this so-called "third-dimensional seeing."

Cove lighting started to come back during 1941, low brightness fluorescent sources making luminous coves practicable. There was also a distinct trend toward close ceiling mounting and coffers.

Street lighting advanced rapidly until priorities and blackout threats intervened. A new highway lighting code was disseminated by the Illuminating Engineering society. The longest stretch of street lighting was installed in Canada—a distance of 70 mi. between Toronto and Niagara Falls, with 6,000-lumen lamps on 200-ft. and 150-ft. spacings.

Transmission and Distribution.—More long-distance transmission was installed in 1941 than at any time since the '20s, when the great expansion of interconnection took place. Montana, Utah and Idaho were connected. Lines were strung west from Grand Coulee, Kansas and Nebraska, hooked up and several lines erected to serve defense industry and cantonments. The southeast drought caused the building of a considerable mileage of tie lines under Federal Power Commission order.

Distribution was devoted more to industrial loads where substation and feeder strengthening was needed. As a result, the amount of underground construction fell off. Many studies, however, were made for extending networks.

The new National Safety code for line construction was issued by the bureau of standards, providing for lower loading requirements and a remapping of the loading areas. Capacitors were used extensively to provide additional capacity without increasing copper, improve voltage and reduce system losses. As the year was closing, regulators were being purchased for the same purpose.

Interest in portable equipment was shown in several directions. Orders were placed for large steam generating sets on flat cars, while smaller portable Diesel sets were used in the rural field. Portable capacitors made their appearance, while the sale of portable substations increased considerably.

Air-blast circuit breakers began to take precedence over oil for indoor use for large currents and several large units were shipped for outdoor use on hydro projects. A fuse with 1,000,000 kva. interrupting capacity at 69,000 volts appeared. Lightning arrestors of higher rating were announced, while at the same time considerable attention was given to lower cost gaps for rural line protection.

There was less of a fundamentally new nature brought out during 1941 because manufacturers generally had more business than they could handle and because the Office of Production Management (*q.v.*) frowned on substituting new design when products in use were functioning. By the end of the year the supply of new devices had virtually dried up.

In industry the trend was toward motors of lower weight and better protection against dirt and heat. Glass insulation was used in larger volume. Networks for interior distribution found use in most new large munitions factories.

Rectifiers were produced in tremendous quantities to take care of the leaping production of aluminum. Metal reduction and alloy melts absorbed quantities of electric furnace. England demonstrated that electric sheet was superior for armament.

There was nothing of particular significance in the home except for the record-breaking consumption of appliances. Agreement was reached on a standard for refillable fuses which became mandatory on Nov. 1 under the National Electrical code for new work.

In a great many respects 1941 was a year of necessity operations with some planning for postwar activities. Unrest due to international conditions, difficulty in getting equipment, threat of government ownership and the cloud of holding company disintegration under the Utility act served to hold things back. (*See* also PUBLIC UTILITIES.)

The split-up of the United Gas Improvement system under the act, according to a "blueprint" made by the Securities and Exchange commission (*q.v.*), gave evidence of what the holding companies might expect. Standard Gas disposed of its San Diego property and was making arrangements to keep as its system the Pittsburgh area. North American was doing likewise. Associated announced a plan and others were expected. Bond and Share through a subsidiary was making plans to give up Houston.

Development of the St. Lawrence and the Arkansas valley up through Colorado was strongly promoted. Vigorous opposition, however, held them up although they were contained in an omnibus bill. Santee-Cooper and Grand Coulee began operations and Marshall Ford, the last link in the Lower Colorado River authority, was completed. (*See* also DAMS.)

The supreme court in the New River case shattered an old precedent by holding all streams capable of being made navigable to come under federal jurisdiction insofar as hydro development was concerned. The FPC invoked the prudent investment theory of rate making in the State Line case. Some few state commissions gave heed to the effect of higher taxes by permitting tax adjustment clauses. The effect was nullified somewhat by the Lawrence Gas case in Massachusetts, where the opposite was decided. The SEC declared the Edison Electric institute to be a service organization under the Utility act and as such it had to register.

Electric Transportation.

Four types of electric transportation were in widespread use in 1941. They were: (1) electrified trunk-line railroads; (2) subway and elevated rapid transit lines; (3) street and interurban electric railways; and (4) electric trolley buses.

During 1941 the progress of all forms of electric transportation was retarded by the prevailing wartime conditions. The number of new electric transportation projects started was smaller than normal. On the other hand, the use of existing facilities was greatly augmented.

In the United States it became apparent, early in 1941, that the demands of the national defense program would be so great that men and materials could not be spared for new projects of a nondefense character. For that reason, no extensions of electrified trunk-line railroads were undertaken and no new rapid transit projects started, although work continued on the subway previously begun at Chicago, Ill. There were a few extensions to existing street and interurban railways, but they were all of a minor character. A few new trolley bus systems were placed in operation during the year, but these had been planned and started before the demands of national defense became predominant.

In Canada the same general conditions prevailed as in the United States. In Great Britain they had come into existence even earlier. Few details were available concerning the electric transportation systems in most of the other countries having extensive facilities of this kind, but all evidence pointed to a virtual cessation of expansion.

Rapid Transit.—In 1940 there were 20 cities throughout the world having either subway or elevated railway service. Those having subways were Barcelona, Berlin, Boston, Buenos Aires, Glasgow, London, Madrid, Moscow, New York, Osaka, Paris, Philadelphia, Sydney and Tokyo. Chicago had an extensive subway project under construction, and similar activities were reported from Munich and Prague. Cities having elevated railway systems included Chicago, Hamburg, Liverpool, New York and Philadelphia. Besides these there were services of a rapid transit character in a number of other places such as Cleveland and Vienna.

Elberfeld (Germany) had the distinction of having the world's only monorail elevated line. In the absence of any information concerning extensions or new rapid transit projects, it would appear that the situation existing in 1940 remained unchanged in 1941.

Surface Electric Railways.—For many years there has been a trend in the United States toward the substitution of motor buses for surface electric rail cars where the volume of traffic is not sufficient to justify the heavy expenditures necessary for the upkeep of track and electric power facilities. Prior to 1941 this trend had resulted in the abandonment of a large amount of suburban and interurban electrified track mileage. City electric railway systems had been influenced by this trend to some extent, but the effect had been more noticeable in the small cities than in the large cities. At the close of 1941 Seattle, Wash., a city of 368,000 population, was the largest city in the United States to have dispensed with all electric railway service. In its place the local transit system was operating a combination of electric trolley buses and motor buses. Among the larger cities, Baltimore, Md., Philadelphia, Pa., Pittsburgh, Pa., St. Louis, Mo.

Cities With New Streamlined Street Cars

(U.S. and Canada—As of Jan. 1, 1942)

New York, N. Y. (Brooklyn)	100	Vancouver, Can.	4

*Los Angeles railway, 95; Pacific Electric railway, 30.

and Washington, D.C. demonstrated their faith in street railways by adding to their fleets of streamlined cars of the type developed by the Electric Railway Presidents' Conference committee. So, too, did Toronto, Can.

Under normal conditions the general trend from electric railway service to service by bus or trolley bus might have been expected to continue during 1941. Early in the year, however, the steady increase in riding made it evident that virtually all the available new vehicles would be needed to provide additional service and for that reason could not be utilized to replace existing vehicles so long as the latter were capable of rendering reasonably satisfactory service. Hence, there was less change from one form of service to another during 1941 than there had been in previous years. In Canada, too, the extent of electric surface railway facilities underwent only slight change.

In Great Britain the local passenger transportation industry had undergone vast changes during the decade preceding the outbreak of World War II. Trolley buses or motor buses had largely superseded the worn-out street railway systems in the smaller towns. Such street railways as were left were mainly in the big industrial cities. Almost every mile of their track had been put in good condition and most of the older street cars had been replaced by new high-speed types. The industry was thus in an excellent condition to meet the strain of war and had continued since 1939 with no significant changes from one type of service to another.

The interurban electric railway field experienced few changes during 1941. New high-speed trains were put in service between Chicago, Ill., and Milwaukee, Wis., and cars of the Presidents' Conference committee type, modified for train operation, were introduced on lines running out of Los Angeles, Calif. A small amount of track was abandoned in favour of motor bus operation.

Trolley Buses.—During 1941 trolley bus operation in the United States expanded steadily. New systems were established at Akron, O., Dayton, O., and San Francisco, Calif. More significant than the establishment of new systems, however, was the expansion of operation in cities where this type of vehicle was already in service. Approximately 2,800 trolley buses were being operated in 67 cities of the United States at the beginning of 1941. By the end of the year the number had increased to approximately 3,200. While this type of service did not yet compare in scope with that of other forms of electric transportation, its progress appeared remarkable in light of the fact that there were scarcely more than 200 such vehicles in service in 1931.

Most of the technical problems connected with the operation of trolley buses have been solved through improvement in design, and this form of transportation has proved itself to be extremely satisfactory and economical. For this reason there was every reason to expect that the next ten years would witness an increase in the use of this vehicle as great as or greater than that which had taken place since 1931.

Traffic Trends.—In contrast to the relatively small changes in the physical plant of the electric transportation systems was a very marked change in the intensity of their use. Under the stimulation of the national defense program in the United States, riding increased sharply on virtually all of these systems. The same situation prevailed in Canada and Great Britain. Outbreak of war in the Pacific further accentuated the need for public transportation service, through curtailment of rubber supplies and the production of private automobiles. As a result, the year closed with indications that the already heavy volume of traffic being carried by the electric transportation systems would be substantially increased during 1942. (J. A. Mi.)

Ellis, Carleton (1876–1941), U.S. research chemist, inventor and author, was born Sept. 20 in Keene, N.H. At the time of his death he held 800 patents, the third largest number for an individual in the history of the United States patent office, and had several hundred patents pending in Washington. He maintained two research laboratories, one in Montclair, N.J., and the other at Key West, Fla. His chemical experiments produced more than 100,000 compounds, and he worked extensively in edible oils and fats, in waxes, synthetic resins, paints, varnishes and petroleum derivatives. He also invented a substance intended to fireproof warplanes against incendiary bullets. He wrote on ultra-violet rays, synthetic resins, hydrogenation of oils and printing inks, and was co-author of a work on *Soilless Growth.* He died Jan. 13 at Miami Beach, Fla.

El Salvador: *see* SALVADOR, EL.

Eltinge, Julian (1883–1941), U.S. actor, was born May 14 at Newtonville, Mass. Eltinge, whose real name was William Dalton, was famous as a female impersonator in the early part of the century. At the age of 10 he played his first female role in an annual revue of the old Boston cadets. In the early 1900s he played in vaudeville and toured the United States and Europe. He gave a command performance at Windsor castle for King Edward VII, who presented him with a bulldog. In 1910, together with two associates, he built the Eltinge theatre in New York city. Eltinge played the dual role of Mrs. Monte and Hal Blake in *The Fascinating Widow* (1911), a play written for him. His other successes were in *The Crinoline Girl* and in *Cousin Lucy.* He starred in several motion pictures in the silent screen days. Eltinge died in New York city, March 7.

Emergency Management, Office for. The Office for Emergency Management, known as the OEM, was established by an administrative order issued May 25, 1940, to function within the executive office of the president created under the reorganization act of Sept. 1939. The purpose of the OEM was twofold: (1) to act as a clearing agency for all information relating to national defense; (2) to provide a liaison between the president and the various defense agencies. On Jan. 7, 1941, its status was further defined as an office which was to assist the president in the discharge of all executive duties in connection with the national emergency. On Feb. 28, 1941, all funds of the advisory commission to the council of national defense were allocated to the OEM, which in 1941 became a sort of "holding company" for the most important agencies of national defense. The following agencies were component parts of the OEM at the close of 1941: Office of Civilian Defense; Defense Communications board; National Defense Mediation board; Office of Price Administration; Office of Production Management; Supply Priorities and Allocations board; Office of Scientific Research and Development; Economic Warfare board; Office of Lend-Lease Administration (*qq.v.*); Office of Defense Health and Welfare Services; Transportation division; Division of Defense Housing Co-ordination; Office of the Co-ordinator of Inter-American Affairs; Office of Agricultural Defense Relations; Co-ordinator of Information

(*see* DONOVAN, WILLIAM J.); Office of Export Control; and the Permanent Joint Board on Defense (U.S. and Canada).

W. H. McReynolds, one of the six assistants in the executive office of the president, was the first liaison officer in charge of OEM, but in April 1941, he was succeeded by Wayne Coy. (*See* also DEFENSE, NATIONAL [U.S.].)

Emmons, Delos Carleton (1888–), U.S. army officer, was born Jan. 17 in Huntington, W.Va. He was graduated from West Point in 1909 and was commissioned as an infantry lieutenant. In 1917, he was transferred to the aviation service of the signal corps, remaining in this branch of the service throughout World War I. In 1934, he was sent to Hawaii as commanding officer of an air unit. He returned to the United States in 1936 and became brigadier general the same year, major general in 1939 and lieutenant general in 1940. He was appointed commanding general of the G.H.Q. air force in 1939. Emmons, who is rated as a command pilot and command observer, the two highest rankings for airmen in the U.S. army, was sent to London in Aug. 1940 as a military observer. In June 1941, he was named chief of the air force combat command. After Secretary of Navy Knox told the nation that Hawaii's defense forces were not on the alert during the Japanese attack on Pearl Harbor, Gen. Emmons was designated Dec. 17, 1941, as head of the army command of the Hawaiian department, succeeding Lieut. Gen. Walter Short (*q.v.*). Emmons was given over-all command of the army and air force at Hawaii.

Endocrinology. Increase in stature and weight is the net result of innumerable bodily processes, the failure of any one of which (even though it is not directly concerned in the process of growth) may result in a growth disturbance. Thus the rate of growth of normal laboratory animals has long been used as an index of the adequacy and completeness of nutrition. Using this general index, Lacqueur and coworkers have shown that the growth hormone present in extracts of the anterior hypophysis is not the only endocrine regulator of the growth process, and that part of its action may be through the stimulation of other glands. They found that hypophysectomized rats which had ceased growing showed some resumption of growth when treated with thyroid extract. It was also possible to obtain some growth response by administering pituitary extracts to thyroidectomized animals. The best stimulation of growth in hypophysectomized rats was obtained by giving both thyroid extract and pituitary hormones, indicating an additive or synergistic action of these materials. However, at this stage of knowledge of the subject, it is impossible to assay the relative importance of the various hormones in the growth process on the basis of any single type of experiment. Certain of the endocrine glands may be more important for some stages of growth and development and less important for others. Salmon showed that the administration of growth hormone to rats which had been thyroidectomized at birth caused very little growth response. But the same treatment of rats thyroidectomized at 35–45 days was followed by a good growth response.

The nonspecific nature of growth in general has made it desirable to seek a more definitive criterion of this process. For this reason much of the significant work during 1941 was based on the observation of the effects obtained on the long bones of the body. Ingalls reviewed the previous knowledge of normal bone growth and added his own careful and systematic studies. The growth of long bones proceeds principally from so-called centres of ossification or epiphyses at each end of the bony shaft. Coincident with the lengthening of the bone there is, of course, also an increase in its diameter, brought about by the deposition of bone from the cells lining the fibrous sheath or periosteum which covers its entire length. But the end of a growing bone lengthens by virtue of the proliferation of the cells composing a transverse layer of cartilage. This proliferation starts at the most distal portion of the cartilage and proceeds in the direction of the bony shaft. As the cartilage cells move farthest away from the centre of growth they become degenerated, then calcified and are finally converted into true bone by an ingrowth of blood vessels and specialized cells from the bone marrow. Thus the continued growth of bone depends upon a maintenance of a rate of proliferation of the epiphyseal cartilage in excess of the rate of calcification and ossification. When this condition no longer obtains, the layer of cartilage narrows as calcification and ossification overtake proliferation; and when the cartilage as such is completely gone, the growing centre has been obliterated and growth ceases. With this outline in mind it is obvious that the influence of a particular hormone will depend upon the degree to which it hastens or retards the proliferation of cartilage, or the calcification and ossification of the cartilage, or both. In addition it may affect the rate of ageing of the bone, which is manifested by a resorption of some of the interior structure and a thinning of the bony cortex.

Ingalls found that after hypophysectomy in the rat there was an inhibition or lack of proliferation of the epiphyseal cartilage, resulting in a definite diminution in its thickness. At the same time, there was an almost corresponding retardation of calcification and ossification, so that while bone growth had ceased the growing centre was not obliterated and remained capable of being stimulated to grow. Adrenalectomy resulted in a very similar situation, which suggests that the interruption of growth which follows hypophysectomy may depend to a considerable extent upon the atrophy of the adrenal cortex, which results from removal of the pituitary gland.

Using similar methods, the Silberbergs implicated a number of other hormones in the process of bone growth. They found that the administration of thyroid hormone to normal animals caused an acceleration of all phases of bone growth. However, while its initial effects were more pronounced as regards cartilage proliferation, the continued administration of thyroid was accompanied by a relative acceleration of calcification and ossification, so that the final result was a premature and permanent cessation of growth. The administration of anterior pituitary extract yielded similar results but without as marked a tendency for reversal of initial growth to cessation of growth. Oestrogen and testosterone caused an inhibition of cartilage proliferation and an increased rate of calcification in some animals, although in others this initial stage of inhibition was followed by a temporary increase in the rate of proliferation of cartilage. Progesterone, on the other hand, induced effects which were more or less directly opposed to those of oestrogen. However, the picture which resulted from the administration of the sex hormones was probably confused by the variable influence of these substances (depending upon the dose and the age of the animal) upon the activity of the other endocrine glands, particularly the anterior hypophysis. Perhaps a clearer indication of the influence of the gonads was gained by gonadectomy in the growing animal. Under these circumstances there was an increased rate of proliferation of the epiphyseal cartilage, accompanied by a retardation of calcification and bone formation, and the rate of growth of bone increased.

While there are a number of parallelisms between the experimental results which have been quoted and the clinical experience gained from the observation of patients suffering from abnormalities of growth, there are also a number of apparent contradictions, and little direct application of the experimental facts can yet be made to the treatment of growth disorders. In fact, the experimental work suggests that the use of individual hormones without relation to the balanced and simultaneous action of others may be a double-edged weapon. However, sufficient is already known to explain certain well known clinical observations, and the more complete knowledge being accumulated should soon amplify our clinical understanding and armamentarium in this field.

Anterior Pituitary Gland.—There was further work relating to the regulation of endocrine activity both by nonendocrine factors and by the influence of one gland on the other. Mulinos and Pomerantz continued their work on undernutrition and showed that undernourished rats develop gonadal atrophy and a loss of sex functions. This effect is through an inhibition of the pituitary and specifically an inhibition of its gonadotropic activity, for their undernourished rats were completely restored to normal sex activity by the administration of chorionic and other gonadotropic substances.

The work of Bakay indicated a regulating influence of the pituitary gland on the pancreas. The pancreatic glands of his dogs, 2½–6 months after hypophysectomy, showed a 20–120% increase in the size of the islets of Langerhans. There was apparently also an appearance of newly formed islets, in which beta-cells seemed to predominate. The nuclei of the beta-cells were somewhat larger than normal. Bakay concluded that the hypophysis normally produces a hormone which inhibits the activity of the islets of Langerhans. If his results are confirmed and his interpretation is correct, this work may lead to an alternative explanation of the so-called "pituitary" diabetic animal. It has hitherto seemed most likely that the production of permanent diabetes in dogs by the administration of increasing massive doses of anterior pituitary extracts was due to an overstimulation of the islet cells, resulting eventually in overwork atrophy. Bakay's work suggests that the explanation may be an overwhelming direct inhibition of the insulin-producing cells to a degree which causes permanent damage.

Thyroid.—It has been previously shown that the simple iodination of casein or serum proteins results in the formation of materials having thyroid hormone activity, and that hydrolysates of these materials contain thyroxine. Work in 1941 tended to show that the above observations have physiological significance as regards the possible extra-thyroidal production of thyroid hormone. Chapman found that the administration of iodine causes some increase in the metabolic rate of thyroidectomized animals. The work of the Silberbergs, already referred to, showed that potassium iodide produced effects on bone growth somewhat similar to those of thyroid hormone when both were compared in the thyroidectomized animal. The nature of the physiologically active complex or compound into which the iodine is incorporated was indicated by the work of Muus and coworkers. These authors tested the products formed by the iodination of serum albumin on myxoedematous patients. They found that their product began to show activity when it contained 6% iodine and increased in activity as its iodine content increased to 10%. It was calculated that the formation of diiodotyrosine could account for the amount of iodine which had to be present to obtain minimum activity, and that the increasing activity with further addition of iodine could be accounted for by the formation of thyroxine.

The regulation of the activity of the thyroid gland has also taken an unexpected turn, according to the evidence obtained from the *in vitro* experiments by Galli-Mainini. The previous discovery of the thyrotropic hormone of the anterior pituitary gland, and of the inhibiting action of the thyroid hormone on the same gland, had seemed to offer a satisfactory mechanism for the autoregulation of this system. However, the latter may be supplemented by an inhibitory action of the thyroid hormone directly upon the thyroid gland. Galli-Mainini showed that, while the addition of thyrotropic hormone to slices of thyroid gland *in vitro* increases the oxygen consumption of the tissue, the addition of thyroglobulin results in a decreased oxygen consumption.

Adrenal Cortex.—Since the demonstration of the diabetogenic effects of anterior pituitary extracts in normal dogs, there have been a number of unsuccessful attempts to obtain similar results in normal rats. The reason for this species difference was still unknown in 1941, but that it was not a fundamental difference as regards susceptibility to diabetes had become clear from the work of Ingle. He found that the administration of 17-hydroxy-11-dehydrocorticosterone to normal rats which were force-fed with a high carbohydrate diet caused hyperglycaemia, glycosuria, an increased urinary excretion of nonprotein nitrogen and a marked loss in weight.

Pancreas.—Despite the years which have passed since the discovery of insulin, its exact mechanism of action is still unknown. There has been general agreement as to only two direct effects of insulin administration: the depression of the blood sugar level and the storage of tissue glycogen. The fall in the level of blood inorganic phosphate which has been observed after insulin administration was formerly attributed to a reflex stimulation of the secretion of epinephrine, as a result of the hypoglycaemia caused by insulin. However, Soskin *et al.* showed that the blood inorganic phosphate change must be considered as one of the direct effects of insulin, since it occurs in the adrenalectomized dog but cannot be produced in the depancreatized animal by any means except insulin. The esterification of the blood inorganic phosphate by insulin, when considered in relation to the wider problem of insulin action on carbohydrate metabolism, may indicate that insulin directly or indirectly facilitates a phosphorylation which precedes the entry of blood glucose into a metabolic cycle necessary for both glycogen storage and oxidative breakdown.

Gonads.—Still another relationship of the sex hormones to the general metabolic functions of the body was demonstrated. Ingle showed that the administration of either estradiol or stilbestrol to normal or partially depancreatized rats produces hyperglycaemia and glycosuria. Similar results were obtained with dihydrostilbestrol and equillin. Massive doses of testosterone and methyl testosterone were only weakly diabetogenic. These results, when distinctly positive, were accompanied by a hypertrophy of the adrenal cortex, and it seemed probable at the close of 1941 that the effects are produced as a result of the stimulation of this gland. (*See* also PHYSIOLOGY; ZOOLOGY.) (S. So.)

England: *see* GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

English Literature.

Poetry and belles lettres were but meagrely represented in 1941. In his *New Year Letter*, W. H. Auden echoed *Hudibras* and thumped his pulpit with his usual skill, without saying anything in particular; while in *Plant and Phantom*, Louis Macneice displayed his customary verbal felicity. On the other flank, Sir Edward Marsh translated the *Odes of Horace* with great polish, and the *North Star* contained some good Binyon. In academic belles lettres students welcomed E. de Selincourt's erudite and definitive edition of *The Poetical Works of William Wordsworth. Poems Written in Youth: Poems Referring to Childhood,* in which he incontestably credited to Wordsworth certain poems usually attributed to Coleridge; and Geoffrey Tillotson's pleasant edition of *The Rape of the Lock*. Among purely critical works, C. B. Tinker's and H. F. Lowry's *Poetry of Matthew Arnold* was a sober and reliable estimate that might well become standard, while Edmund Wilson's *To the Finland Station* was a subtle and provocative analysis of the 19th century French historians and their influence on Lenin and his circle that should have attracted far more attention than it did.

History and biography, too, were comparatively ill represented. G. B. Harrison's *Jacobean Journal* carries on to the 17th century the amusing and illuminating newsreel he began in his *Elizabethan Journals*, and succeeds by its mosaic of quotation and learned parody in giving a truer cross section of Jacobean England than the majority of formal histories; while in more conventional mode, A. L. Rowse published an erudite and accomplished research into the culture and economy of *Tudor Cornwall;* and Adam Carse explored a neglected field in his scholarly *Orchestra in the XVIIIth Century.* In biography, J. L. Clifford, F. W. Walbank and Denis Mackail offered studies of Mrs. Thrale, Philip of Macedon and James Barrie respectively, of which only *The Life of Mrs. Thrale* is likely to have any lasting interest, though Mackail's *The Story of J. M. B.* will no doubt prove to be the standard life of its hero.

As was to be expected, by far the largest proportion of the year's outstanding books dealt with the conduct of the war, the prospects of the peace and the policies of the principal protagonists. How much grain was mingled with so much chaff will not be known for a decade, and the best a contemporary can do is to record those works which attracted the most attention and exercised the greatest immediate influence. *Black Record,* Sir Robert (now Lord) Vansittart's vigorous if challenging pocket history of the Teutonic "butcher-bird," was one of the year's best sellers.

Prominent among the military histories were Viscount Gort's revealing and depressing *Despatches,* and the air ministry's inspiring *Battle of Britain;* and on the sociopolitical side the American *Ambassador Dodd's Diary* and William Shirer's *Berlin Diary* excited considerable attention. But for the most part, censorship, the nearness of events, and the discretion of those most actively engaged have prevented the appearance of more than rehashed daily journalism.

The novelists, as usual, proved prolific. Somerset Maugham retained his customary felicitous sentimentality, and *Up at the Villa,* although far beneath his best, was pleasantly enough turned. Elizabeth Bowen, too, displayed her delicate if hypersensitive talent in *Look at All Those Roses;* and Virginia Woolf's last novel, *Between the Acts,* was a worthy memorial of an unusual writer. Of the rest, *Manhold* by Phyllis Bentley, *The Bay* by L. A. G. Strong, *Proceed, Sergeant Lamb* by Robert Graves, *The Ocean* by James Hanley, *Conquer* by John Masefield, all provided what we have come to expect from their authors.

The fourth quarter of the year was proportionately more productive than the preceding three. T. S. Eliot's *The Dry Salvages* was the most important poem of the year, and showed its author's increasing metaphysical preoccupations. Aldous Huxley, too, continued to pursue his philosophic hare, and in *Grey Eminence,* a polished and acute historical biography, his first essay in the genre, argues over again the problem of means and ends. *The Empty Room,* Charles Morgan's little novelette, seemed also to carry some underlying message, but the critics were unable to agree as to what precisely this might be. Both H. G. Wells and Wyndham Lewis published new novels, but neither of them succeeded in enhancing their previous reputations. In another field, Dr. Rostovtzeff at length published his *Social and Economic History of the Hellenistic World.* (*See* AMERICAN LITERATURE; PUBLISHING [BOOK].) (J. MR.)

Entomology.

During times of peace, entomologists are concerned chiefly with teaching and research work having to do with the general routine of economic entomology, medical entomology, horticultural quarantine and investigations in history and systematics.

The enormous losses inflicted on man's food supply during normal conditions amount to several billion dollars in the United States annually, and a large staff of research and field men is employed to cope with the various unpredictable situations as they arise.

In wartime the many activities of entomologists are either greatly modified or completely changed and are concentrated chiefly along the lines of food production and conservation and toward camp and personal sanitation and the prevention and control of tormenting or disease-bearing insects. Some of the specialized types of practical work and research investigations may be briefly summarized in these pages.

Increase and Preservation of Food Supplies.—It is obviously important to produce as much food as possible and every effort was being made in 1941 to prevent and reduce losses due to insect infestations of the growing crops. Special programs were inaugurated to deal with such injurious insects as grasshoppers and locusts, cutworms and army-worms, chinch bugs, the Hessian fly, potato beetle, codlin moth, cotton boll weevil and a host of other insects that yearly destroy 5% to 20% of the crops of American farmers. Many peacetime activities were abandoned to unite the efforts of agricultural extension specialists, leaders of farmers' organizations, entomologists of agricultural experiment stations, colleges of agriculture and employees of state, county and city governments throughout the entire United States. Of even greater importance is the proper storage and preservation of foodstuffs following harvest and especially the products being supplied to army cantonments and shipped overseas to the Allies. Losses occasioned by stored product insects such as grain moths, beetles, weevils and mites, although tremendous during normal times, are unbelievable under war conditions. The devastation of vast stores of wheat by insects and rodents during World War I prompted the British in 1940 to adopt drastic measures to preserve every pound of wheat, beans, peas, dried fruit, cured meat and other essential food products that were raised in or shipped into the United Kingdom. Accordingly, all the entomologists available were detailed to the tremendous task of food protection. The bureau of entomology and plant quarantine, United States department of agriculture, issued a large series of special circulars dealing with subjects pertinent to the national defense program. Topics treated in these circulars were: chiggers, bed-bugs, cockroaches, fabric insects, fleas, house-flies, stable flies, screwworms, horse bots, food insects, fumigation, lice, mosquitoes, powder-post beetles and termites. To become really effective the work must be carried beyond the fields and points of storage to the supply depots of the army camps and aboard the ships of the navy. A large number of entomologists trained for this particular kind of work were available in 1941 for service in the quartermaster's department where this important work is centred. The routine involves the use of suitable tight containers for the food, such as barrels, cans, closed bins, sealed packages and cartons; and airy, well ventilated and dry storage and refrigeration facilities. In spite of all precautions that are generally taken, infestations are likely to appear, especially in products that are a year or more old. Although such contaminated food is unfit to eat, it often escapes detection until it literally crawls and the warehouses, kitchens and living quarters in the camps and depots become so thoroughly infested that all new and clean stores are infested immediately upon their arrival. In addition to the insects that actually breed and live in the food products, buildings and ships may also harbour such nuisances as cockroaches, ants, house-flies, fleas, bed-bugs, lice and other so-called vermin that add to the spoilage of food supplies and to the discomfiture of the inhabitants.

Under such conditions control measures are imperative. These require the supervision of an expert experienced in the uses of heat, cold storage and such fumigants as hydrocyanic acid gas, calcium cyanide powder, methyl bromide, chloropicrin, sulphur dioxide, naphthalene, paradichlorobenzene, ethylene dichloride, carbon tetrachloride, ethylene oxide and other chemicals. These fumigants cannot be administered without certain other complements such as tight compartments, bins, rubberized tarpaulins or special fumigating rooms and adequate gas masks for the protection of the operators. The conditioning of rooms and food supplies for fumigation requires knowledge, experience and skill. The net results of such pest control operations prevents loss of supplies and guarantees wholesome food.

Sanitation of Buildings and Grounds.—Although many of the camps and ships are newly constructed, it is surprising how quickly the insect pests move in with the men, supplies and equipment. Termites soon attack the wooden structures. Ants, cockroaches and flies are on hand immediately and cannot be ignored in the efforts to keep the men healthy and contented. Such insects require camp sanitation outside as well as inside the buildings. Garbage and sewage disposal should be considered in the light of insect control as well as a means of protecting health. The proper use of insecticides, including dusts, sprays, powders and vapours, heat and steam are sure to be required in every camp and ship occupied for more than a few weeks at a time.

Insects Affecting the Health and Comfort of Soldiers and Sailors.—Under this heading are included such insects as crab lice, body lice, fleas, bed-bugs and mosquitoes which infest the person, and some which may transmit serious diseases like typhus and trench fever. It is rather difficult to understand why lice for instance, always appear on soldiers concentrated in camps even though the establishments are new, whereas under normal conditions these insects are relatively rare even under the crowded conditions of large cities. One explanation is the lack of proper laundering and cleaning of the clothes and a lack of hot-water facilities, which are not often available in temporary camps. The solution of the louse problem was an almost impossible one during World War I, although the principles of delousing by steam, boiling water, hot air and fumigating were well known.

In European armies, especially in the German army, elaborate equipment has been perfected for the treatment of clothing by the use of powdered cyanide. The proper amount sealed in a tin can is placed in the machine which automatically carries it into a small tight compartment which opens and empties the fumigant and a short time later delivers the garments, heated and aired, to the soldier who has emerged naked from a spray treatment which ensures him a clean body and pest-free clothes. The bedding and all sleeping and personal effects, and the barracks as well, are fumigated or otherwise treated for lice, bed-bugs and fleas by the judicious use of dry heat, hot water, live steam, chemical dusts and sprays, fumigation, cold or hot storage or exposure to the sun. Body treatment consists in closely clipping the hair and in the use of mercurial ointments, mixtures of equal parts of kerosene and olive or other vegetable oil or kerosene and vinegar, special chemical soaps, oil and soap emulsions, and a powder composed of 3% rotenone, 96% naphthalene+2% creosote+2% iodoform. The clothing, blankets and other woollen fabrics and furs may be protected from attacks of clothes moths and carpet beetles by moth-proofing with chemicals, the constant liberal use of naphthalene and para-dichlorobenzene crystals, refrigeration and cold storage, fumigation and frequent exposure to the hot rays of the sun.

Bed-bugs may be eliminated by fumigation with hydrocyanic acid gas, heating to 125° F. to 130° F. for 12 hr. and by spraying the bedstead, walls, floors, ceiling and furniture with light petroleum oils.

The Mosquito Problem.—The avoidance of mosquito-infested areas should be a prime consideration in the establishment of permanent or even temporary camps for soldiers or civilians and much care and good judgment should be exercised with regard to this matter. In the subtropical and tropical regions mosquito-free areas are not always available, but there is always the possibility of selecting places with the lowest populations or with the greatest opportunities for mosquito control. Such places should be either far from swamps, standing fresh or brackish water, or sufficiently elevated to permit drainage and the elimination of standing water. Otherwise great expense must be incurred in order to fill low places and pump out the standing water, clear away aquatic vegetation, to treat the water with light oils, Paris green, borax, pyrethrum and other insecticides and to afford protection to the men by means of repellent sprays and ointments, netting, screening and other safeguards.

Extension Entomologists and the National Defense Program.—In 1941 the extension entomologists were making distinct and valuable contributions to the knowledge of insect control by the many different approaches to this problem which they employed in the multitudinous problems that were confronted in the farming communities throughout the entire United States. Some of the features of the defense which they emphasized in the national defense program were: (1) Preparedness in insect control—to outline the objectives and the methods of operations and to assist the farmers in procuring in advance the proper equipment and insecticides to meet the emergencies as they arose. (2) An all year-round educational program concerning the injurious insect pests in the various communities and a familiarization with the latest recommended practices and the distribution of practical and technical information in printed form. (3) Programs emphasizing the importance of agricultural practices in reducing losses caused by insects and instructing farmers how to reduce or eliminate pests by cultural methods, crop rotation, growing insect-resistant varieties of plants, farm sanitation, most effective times of planting and harvesting and by the protection of crops in storage. (4) The use of exhibits, conducting special caravans and visits to familiarize the farmers with the insects, their depredations and means for their control. (5) Proper recommendations as to amounts of injury and infestation by insects warranting the application of control measures. (6) Assisting the farmers in connection with insect problems in relation to domestic animals, members of the family and the household in general—and especially aiding in obtaining better and more healthful sanitary conditions for humans and animals on the farm. (7) Extending the scope of agricultural activities to include the production of honey and beeswax and the benefits derived in the pollination of agricultural crops.

Insect-Resistant Plants.—For many years agriculturists and entomologists have been selecting and breeding plants that show resistance to the attacks of various insects. Packard in 1941 showed that Hessian-fly-resistant wheats have been observed in America since 1781 and that thousands of varieties of wheat have been tested and promising selections have been made from such well known varieties as Dawson, Karovale, Marquillo and also from countless other breeding strains. It is worthy of note that Hessian fly resistance is transferable according to the laws of genetics from spring to winter wheat and vice versa without obtaining objectionable features and that resistance to fly may be successfully combined with resistance to fungus diseases in a single homozygous line.

Wheat varieties were also known that are resistant to the chinch bug, the wheat stem maggots, fruit fly and jointworms.

Selections of alfalfa were reported to be resistant to the potato leaf hopper and to the pea aphid.

Codlin Moth Control by Organic Insecticides.—Attempts to find substitutes for the heavy metal insecticides in codlin moth control resulted in a vast amount of investigational work in North America since 1932. Organic substitutes which have given some promise are extracts of nicotine, pyrethrum, phenothiazin and xanthane, and combinations of these extracts with petroleum and fish oils, bentonite and other materials. The pyrethrum and phenothiazine extracts have not proven as satisfactory as the other extracts.

The Fowl Malaria Organism.—The fowl malaria organism, *Plasmodium gallinaccum* Brumpt, may possibly be transmitted by the European mosquito, *Culex quinquefasciatus*, according to experiments of Vargas and Beltrain, who dissected sporozoites of the parasite from the salivary glands of this mosquito reared in the laboratory.

Sheep Tick Problem in Great Britain.—The sheep tick, *Ixodes ricinus* Linn., causes losses up to 50% of sheep not acclimatized to the diseases known as louping-ill and tick-borne fever. The tick is able to survive on a variety of hosts in the absence of sheep and is well adapted to the moorland and hill regions where it is active in spring and early summer and again in the fall.

Derris dusts afford protection for a period of two weeks for lambs, and a dip composed of either a 0.2% arsenious oxide or 0.02% derris resin is effective on adult sheep for a period of 10–14 days.

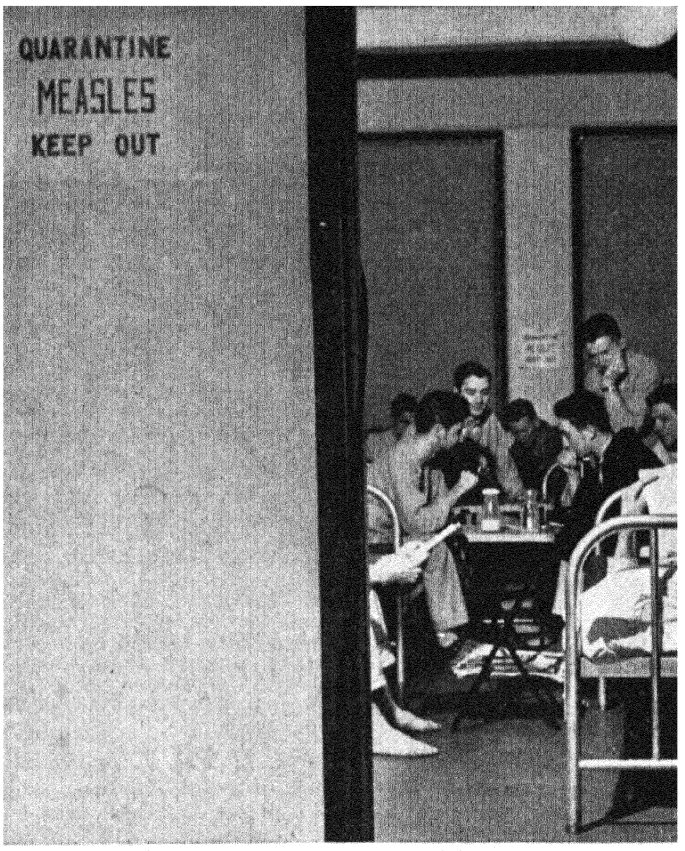
Epidemics and Public Health Control.

For the first time, Cox *et al.* reported the finding of the virus of the western strain of equine encephalomyelitis in a host other than man and horses.



AN EPIDEMIC OF MEASLES and scarlet fever broke out at Chanute field of the army air forces at Rantoul, Ill. in March 1941. Similar outbreaks occurred in other U.S. camps during the year

The virus was isolated from a prairie chicken near Rugby, N.D.

In a study of the vectors of equine encephalomyelitis in Massachusetts, Feemster and Getting found the *Aedes Vexans* mosquito to be the most important vector. The peak of incidence of these mosquitoes is late in August.

Piszczek *et al.* in investigating an outbreak of poliomyelitis in Cook County, Ill., found the virus of this disease in healthy children who were in contact with adult members of their families who became ill with infantile paralysis. This established the existence of healthy carriers.

Influenza.—Horsfall *et al.* used a complex vaccine against influenza A. In volunteers who had received a single subcutaneous injection of complex vaccine of good antigenic potency four months previously, the incidence of influenza A during an epidemic was 50% lower than among unvaccinated individuals in identical environmental circumstances. The incidence of influenza of unknown cause was not significantly different in the two groups. The complex vaccine used was a preparation containing the influenza A virus plus the X strain of canine distemper virus.

Two types of specific virus have thus far been isolated; namely, influenza A and influenza B. These two types, however, have not been the cause of all reported influenza cases. There are still cases of influenza of unknown etiology.

Pneumonia.—Felton *et al.*, in a study on immunizing substances in pneumonia, conclude that active immunization against pneumonia is not practicable on a large scale, although rapid strides toward this goal are being made. In this particular study, Felton and his coworkers established the optimum antigenic dose of polysaccharide of types 1 and 2 pneumococcus as measured by serum protective antibody titre.

Bacillary Dysentery.—In the treatment of acute bacillary dysentery, Lyon had excellent results with sulphanilylguanidine. The drug was given in milk or water suspension, each patient receiving .1 gm. per kilo body weight as the first dose and then .05 gm. per kilo every four hours. It was found that this drug could be given in big enough doses to saturate the intestinal contents and still keep the blood concentration down to 1.4% mg.

Tetanus.—Hall in studying the effectiveness of tetanus toxoid, pointed out that tetanus had not been reported in an inoculated individual.

Rheumatic Fever.—John R. Paul, in a study of rheumatic fever, pointed out that rheumatic fever is in a position of importance ahead of all other chronic infectious diseases, with the exception of tuberculosis and syphilis. Rheumatic fever is due to the faulty disposal of streptococcus haemolyticus within the rheumatic or potential rheumatic patient. Rheumatic fever is considered to be a "crowd" disease. Intimately related to the prevalence of heart disease are the problems of malnutrition, crowding, uncleanliness, poor ventilation and the presence of vermin. Rheumatic fever is definitely a family disease. In families with rheumatic fever, the prevalence is twice as high as in nonrheumatic families. In rheumatic families, 10% of exposed persons are affected as against 3% in nonrheumatic families. This suggests a hereditary influence. (*See* also BACTERIOLOGY; ENTOMOLOGY.)

Estonia. One of the Baltic states of northeastern Europe, north of Latvia, south of Finland, formerly a republic; became part of Germany's "Ostland" in 1941. Area, 18,371 sq.mi.; pop. (est. 1939) 1,122,000. Chief towns: Tallinn (capital, 145,000); Tartu (60,800); Narva (24,500); Nomme (21,900); Pärnu (21,800). Language, Estonian (a Finno-Ugrian tongue). Religion, Christian (Lutheran 78%, Greek Orthodox 19%). Ruler at the end of 1941: the German reich through Reichscommissar H. Lohse of the Ostland and a local council.

History.—Behind the events of 1941 in Estonia and the other Baltic states one must remember the sequence of events after Sept. 29, 1939, when Estonia signed her "treaty of mutual assistance" with the U.S.S.R. and granted garrison privileges to the Red army. Immediately after June 15, 1940, the Russians definitely occupied the country, perhaps forestalling a German putsch. On July 15 Estonia "voted" to apply for membership in the U.S.S.R. and in August was accepted as the 16th soviet republic. Until the summer of 1941, Estonia remained under soviet domination. It is clear that collectivization was not completed in this one year of control, but the status of some of the larger farms and factories was changed. Goods from Estonia appeared in the markets of Moscow, and the economy of Estonia was evidently being reoriented. Although reports were lacking in 1941, except through German sources, it would appear that the soviet occupation was disillusioning to say the least.

When the Germans struck against the U.S.S.R. on June 22, 1941, Estonia's geographic position delayed the struggle there for a short time. The Germans struck from the south, through Latvia, and aimed directly at Leningrad, by-passing Tallinn and the whole northwest portion of Estonia. In August, as the attack on Leningrad settled into a siege, the nazis turned strongly on the Russian forces threatening their flanks. After repeated attacks, with shelling from land and bombing from the air, the Germans announced the capture of Tallinn on Aug. 29. They claimed to have sunk some 60 Russian transports and other naval vessels in an evacuation claimed to be a "new Dunkirk." Repeatedly thereafter German reports talked of the taking of the islands to the west of Estonia, but fighting continued, and apparently Russian garrisons still held out on Oesel and Dagoe at the end of 1941.

Politically the Estonian picture was both chaotic and incomplete at the beginning of 1942. A five-man council of Estonian nazis was set up under German direction, each man to be known as a "fuehrer" rather than minister. The new invaders, of course, got factories back into operation as quickly as possible, but the difficulty of conditions was illustrated by the fact that as late as November there was no regular postal service with Germany. Railways which operated on the Russian broad gauge were being changed to the western European standard. The German Commerz bank opened a subsidiary in Tallinn. Administration centred in Riga, where Reichscommissar Lohse established himself. Seemingly the entire area of the German conquests from the U.S.S.R. was to be put under the direction of Alfred Rosenberg, whose appointment on Nov. 17 barely antedated the beginning of the general nazi retreat. Things were very much in flux as the year 1942 dawned in the north. (*See* also WORLD WAR II.)

No statistics relating to education and economic conditions in Estonia were issued after Russian occupation of the country in June 1940. The latest statistics available at the end of 1941 were for 1939 or earlier years.

Education.—In 1937–38 there were 1,224 elementary schools, 58 middle schools, 39 technical schools and 30 agricultural schools. Tartu (Dorpat) university had 3,219 students and 217 professors in 1938.

Finance.—The monetary unit is the kroon (26.7 U.S. cents at par). Effects of German monetary changes in 1941 were uncertain. Revenue (est. 1939–40) 99,293,000 kroons; expenditure 99,293,000 kroons.

Trade and Communication.—Imports in 1939 totalled 101,351,000 kroons; exports 118,217,000 kroons. Principal imports were raw cotton, sugar, woollen yarns and thread, iron and steel. Principal exports were butter, wood and paper, cotton goods, cellulose, flax and tow, meat products and eggs. Imports were chiefly from Germany, Great Britain, Sweden, the United States and the U.S.S.R. Exports were chiefly to Great Britain, Germany, Finland, the United States and Sweden.

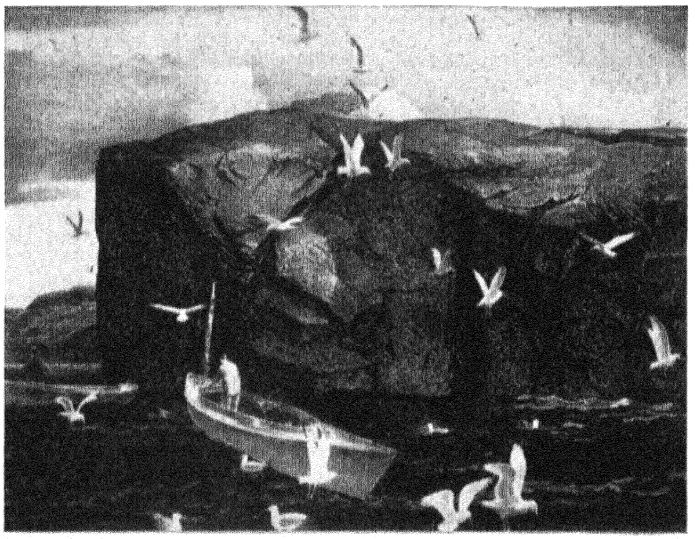
Agriculture.—Production (in short tons) of the leading crops in 1939 was as follows: rye (250,994), potatoes (963,741), oats (164,684), barley (99,207) and wheat (94,026). Estonia in 1938 had 660,890 cattle, 649,730 sheep, 384,580 pigs, 219,020 horses and 1,596,570 chickens.

Manufacturing and Mineral Production.—Manufacturing production was valued at 166,238,000 kroons in 1937. One of the larger cotton mills in Europe is at Narva, where textile manufactures in 1937 were valued at 47,425,000 kroons. Other important industries are paper and wood, food products, cement, flax, leather. Shale oil production rose rapidly to 209,437 short tons in 1939. Approximately 60,000 people were employed in industry in 1938. (F. D. S.)

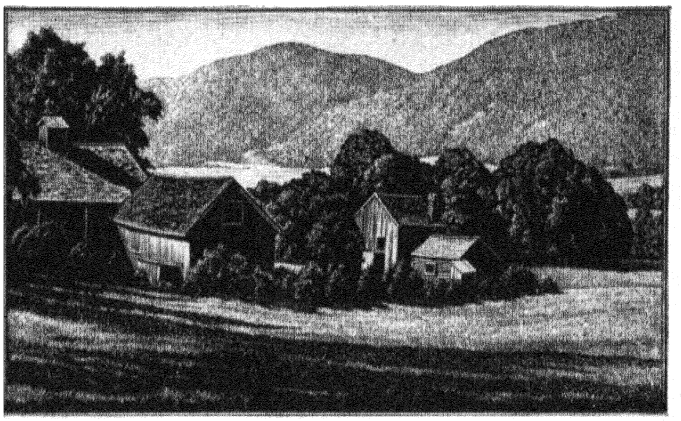
Etching. Since artists are primarily concerned with the spiritual expression of a people, they are the first to feel, and their work the first to reflect, such a cataclysmic upheaval as that of World War II. In the dictator-ridden countries, where free thought was suppressed, all art that did not conform to the regimentation of a set formula could only find covert expression, and since art is essentially free it may be said to have perished, for the moment, in these lands. And, though in those countries where the democratic way of life still persisted all forms of creative expression were stimulated rather than otherwise by the conflict (England being a notable example), the necessarily increased difficulties of communication militated against international exchange. In the United States the artists, barred from direct contact with other countries except as such had been effected through refugees from them, turned inward upon their own land with increasing interest, and this brought about a tremendous stimulus to the national element in their production. What effect upon this strictly American art the influx of refugee artists have is a matter of great interest to all those concerned with the future life of the U.S., but it can only be revealed by the passage of time. So well developed along national channels has American art become, however, that it is more than possible the influence may be reversed, and that, instead of American art being profoundly influenced by the artists of foreign lands who have sought safety and the right to live freely, Americans may be the ones who influence them.

The country by country review of current European etching that has been made in these pages in the past must necessarily be omitted for 1941. Spain, Italy, the Scandinavian countries, Poland, Hungary and Czechoslovakia, where etching, as a means of creative expression, still existed, even though it could not flourish, immediately prior to 1941, were all so deeply and tragically involved in the chaos of war that it is safe to say art was practically dead within their borders, though that it would revive when peace ultimately returned is inevitable.

France.—In unoccupied France those etchers who survived June 1940 carried on as best they might in the face of their struggle for very existence, but who they were, where they worked and what they created was not known.

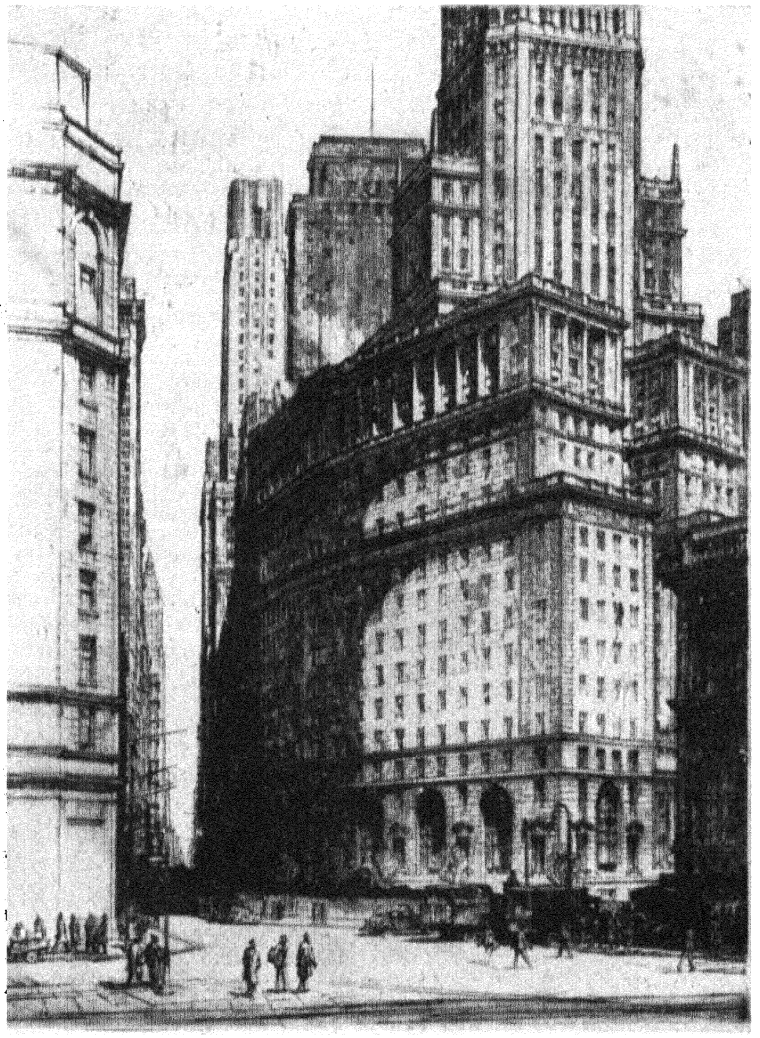


LITHOGRAPH by Stow Wengenroth: "Deep Water"

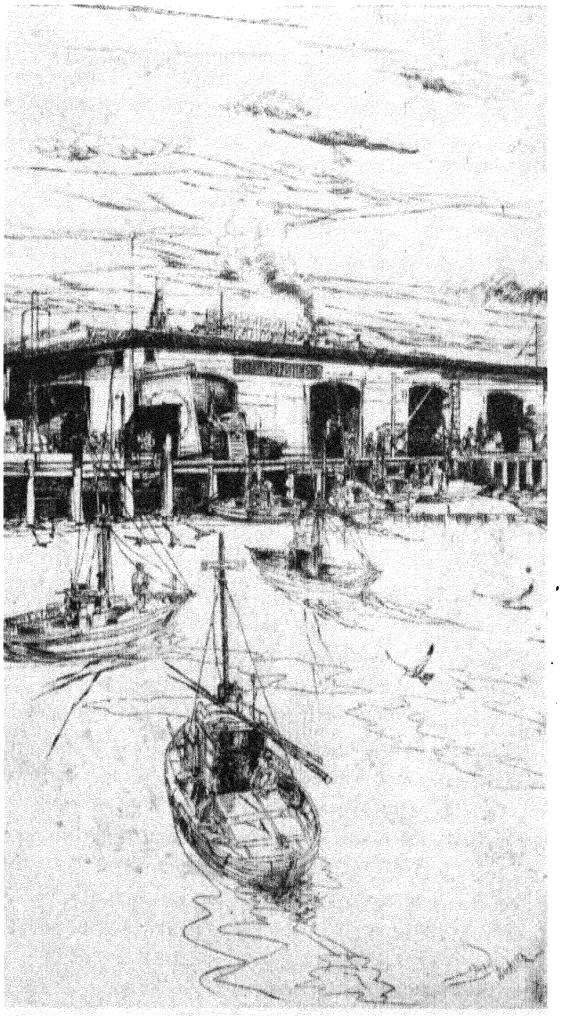


'DISTANT HAZE" (Essex county, N.Y.), wood engraving by Asa Cheffetz

"BOWLING GREEN, NEW YORK," dry-point by Louis C. Rosenberg



"STANDARD FISHERIES," etching by John W. Winkler



India.—It is worthy of note that in India the veteran etcher Mukul Dey, for long the leading exponent of this form of expression in that country, published new prints in 1941. As far as art is concerned, the countries of the far east were silent.

Great Britain.—In spite of the sacrifices demanded of the people of Great Britain by their country, British etchers managed to produce new work in 1941. Many were making pictorial records of war activities, first-hand documents for posterity, both at the front and in shipyards and munition works at home. Exhibitions were held as usual and both the Royal academy and the Royal Society of Painter-Etchers and Engravers displayed many etchings in their annual shows.

Latin America.—Latin-American art continued to attract attention in the United States, due to the closer relations developing between the countries of the western hemisphere. The woodcut and the lithograph remained the most popular forms of graphic expression south of the Rio Grande, though Uruguay, Venezuela, Argentina and Mexico all boasted native etchers who were producing significant work.

United States.—In the United States all the established etchers published work during 1941, while many new names appeared in print exhibition catalogues. In addition, numerous refugee artists from Europe showed their work. A list of all etchers active in the U.S. during the year would be too long to print in this article. Not only have the old established print societies which number many etchers in their memberships—as the Society of American Etchers in the east, the Southern Printmakers in the south, the Chicago Society of Etchers, the Prairie Printmakers in the mid-west, the Southwest Printmakers, the Printmakers Society of California, the California Society of Etchers, the Rocky Mountain Printmakers and the Northwest Printmakers in their respective parts of the country—held their annual and their travelling exhibitions as usual, but new groups were formed as the interest in fine prints spread. The entry of the United States into the war, at the end of the year, would, it seemed, enlarge the activities of these organizations rather than otherwise. The American National Committee of Engraving in 1941 had 17 print shows circulating throughout the United States and abroad, among them being exhibitions of Hawaiian, Mexican and Uruguayan prints; an exhibition of Graphic Art of the Western Hemisphere assembled for the International Business Machines corporation, which attracted 50,000 visitors in three days when shown in Montevideo; the exhibition of Prints by British Artists in Service, which had been travelling throughout the United States and its possessions for more than a year and the proceeds from whose sales went in toto to the artists involved; and a survey of contemporary American prints shown at the Carnegie institute in Pittsburgh. Other travelling print shows including etchings, and sponsored by this organization have been National Trends in Printmaking, Seventy-Five Miniatures, Vanguard Prints, and Print Processes. An interesting and gratifying development in contemporary American printmaking has been the union of art and industry as effected by the policy of the International Business Machines corporation under the enlightened and progressive leadership of Thomas J. Watson. The National Academy of Design and the WPA continued very active in their sponsorship of graphic art.

The principal graphic art society in Canada, the Royal Society of Canadian Painter-Etchers and Engravers, maintained its activities in the face of war pressure. (J. T. AR.)

Ethical Culture Movement.

A religious fellowship, founded in New York in 1876 by Felix Adler, and in London in 1886 by Stanton Coit. Acceptance of a common theological creed is dispensed with. The basis is "dedication to the ever-increasing knowledge, love and practice of the Right." Extension of ethical knowledge is considered equally important with improvement of practice in personal, social, political, national and international relations. The American movement was represented in 1941 by active societies in New York, Chicago, St. Louis, Philadelphia, Brooklyn, and by groups in West Chester and elsewhere. These were united in the American Ethical union (secretary, George E. O'Dell; headquarters, 2 West 64th st., New York), which holds periodical conferences and publishes a monthly magazine (*The Standard*) and other literature. The Ethical Culture movement pioneered in establishing social settlements, district nursing and legal aid to the poor, housing reform and improved methods of education. In 1940–41 much work was done in aiding refugees from Europe. The New York Ethical Culture society organized the Good Neighbor committee (interdenominational) for this and other co-operative purposes. Summer "work-camps," in which young people of different national and cultural origins are assembled, were conducted as experiments in democratic living, to supplement winter studies for the understanding and defense of American institutions. In 1941 considerable aid was given to the English Ethical societies which suffered by bombing in London. These were organized in an Ethical union (chairman, Lord Snell, 12 Palmer st., London, S.W.1).

Ethiopia.

A kingdom of northeast Africa. Area, *c.* 350,000 sq.mi.; pop. (est. Dec. 31, 1939), 9,500,000; capital, Addis Ababa; religions, Christian (Copt) and Mohammedan; languages, Amharic and Arabic; ruler, Emperor Haile Selassie I.

History.—The small British mission which slipped across the frontier in Aug. 1940 set up its headquarters in Gojjam and, promulgating the emperor of Ethiopia's proclamation, succeeded during the following five months in its plan of containing within the confines of Ethiopia such Italian forces as might have been used for further attacks on the Sudan and Egypt. Early in 1941 the emperor, Haile Selassie, re-entered his country. Crossing the Sudan-Ethiopian border south of Gallabat on Jan. 15, he made his way, with the assistance of Ethiopian patriot forces supported by units of the Sudan defense force and an Ethiopian battalion raised from Ethiopian refugees, to the plateau country in the west of Gojjam.

As a result of the harassing tactics of these forces and of the fear that their own line of retreat might be jeopardized, the

EXILED SINCE 1936, Haile Selassie re-entered Addis Ababa May 5, 1941 and received the homage of his subjects

Italian garrison in Gojjam withdrew across the Blue Nile after evacuating their forts in Gojjam. Debra Markos was entered on April 4 by the emperor and his patriot army. Meanwhile British troops had been set in motion. In the north, Eritrea had fallen, after stubborn fighting at Cheren, to Gen. Platt and his army from the Sudan, which included British and Indian regiments as well as Sudanese. From the southeast a third attack was directed against Italian Somaliland by Gen. Sir Alan Cunningham (*q.v.*) and his South, East and West African army. The crossing of the Juba river by his troops led to the fall of Kismayu and Mogadishu, and the loss of these bases caused the Italians to beat a hasty retreat toward the railway line connecting Jibuti in French Somaliland with the Ethiopian capital. Within a few days Addis Ababa itself was declared an open town and was thrown open to the advancing British troops April 6.

The emperor re-entered his capital in state May 5, after an absence of five years. The duke of Aosta, governor general and commander in chief of Italian East Africa, retreated northward with the forces left to him, and, after a brief stand at Dessye, took up a strong position in the natural fortress of Amba Alagi. Encircled, however, from the north by the advance of Gen. Platt's army and from the south by the South African forces which, under Gen. Cunningham's command, had followed him closely up the road from Addis Ababa, the duke surrendered, after a preliminary bombardment, to the British on May 19. Meanwhile Italian positions to the south and southwest were being harassed by the combined guerrilla tactics of both patriot Ethiopians and British troops, and the situation in these districts took only a short time to clear up. By September the only pocket of Italian resistance left was in Gondar district, and on Nov. 27 the surrender of Gondar ended the East African campaign. (*See* also WORLD WAR II.) (C. SA.)

Trade and Communication.—Chief exports: hides and skins, coffee (13,000 metric tons in 1937–38) and gold. Roads (1940), *c.* 4,340 mi.; railways (Addis Ababa to Jibuti in French Somaliland), 486 mi.

Evans, Sir Arthur John (1851–1941), British archaeologist, was born July 8 at Nash Mills, Herts., Eng., the eldest son of Sir John Evans, one of England's great authorities on the neolithic and palaeolithic ages. Sir Arthur was widely known for his excavations in Crete in 1893 which resulted in important discoveries concerning the history of ancient Greece. He was honoured for his discoveries by academies throughout Europe; among his awards were the Royal Gold medal of the Royal Institute of British Architects, 1909; the Petrie medal, 1931; and the Copley medal of the Royal Society, 1936. He died at Youlbury, Boars Hill, Oxford, July 11. (See *Encyclopædia Britannica.*)

Events of the Year: *see* CALENDAR OF EVENTS, 1941, pages 1–16.

Eves, Reginald Grenville (1876–1941), British portrait painter, was born in London and was educated at University College school. In 1891 he entered the Slade School of Art. A protégé of the late John Singer Sargent, he was in demand as a portrait painter in British political and social circles. In 1931 Mr. Eves fell into disfavour in British art circles because three of his paintings sent to the Royal academy exhibition were discovered to be enlarged photographs painted over. Mr. Eves explained that he used this device as a timesaver when neuritis affected his arm. The sensation caused by this unique method of drawing delayed his election to the conservative Royal academy until 1939. His portraits of Thomas Hardy, Max Beerbohm, Sir Ernest Shackleton and Admiral Jellicoe hang in British museums. He died in Middleton, Teesdale county, Durham, England, June 14.

Exchange Control and Exchange Rates.

The United States and China occupied the centre of the exchange control stage during 1941. During the summer months, the governments of those two countries, in conjunction with the British, amended their exchange control systems in order to tighten their economic and financial blockade of the axis. Developments elsewhere were, by comparison, of a minor character; they consisted in the main either of geographical extensions of particular systems of control or of relatively slight modifications in the method of operation. The extension of U.S. "freezing" orders curtailed further the already restricted trading in foreign exchange in New York, by Jan. 1, 1942, the only important foreign exchange market; after July the New York Federal Reserve bank certified exchange rates on only British empire and Latin-American currencies, and practically all of these were subject to some sort of control. As an outgrowth of the widespread adoption of rigid exchange controls, there developed a sizeable market in New York for foreign currency notes, which were offered at a considerable discount under the official rates of exchange.

United States.—Exchange control in the United States progressed during 1941 from a merely defensive measure, designed to protect the assets in the United States of governments and nationals of invaded European countries from seizure by the invader, to an important instrument, first, of national defense and, later, of economic warfare. During the early months of the year, Bulgaria, Greece, Hungary and Yugoslavia were added to the list of frozen countries. On June 14 assets of continental European countries not previously frozen were blocked and an inventory of all foreign-owned assets in the United States, whether or not they belonged to blocked countries or nationals thereof, was ordered.

The inventory of foreign-owned property in the United States was expected to be the most comprehensive tabulation ever made of foreign-owned property in the United States. The inventory was designed to secure complete information on the actual foreign ownership, as well as on changes in nominee holders from June 1, 1940. Reports on nominal ownership both as of June 1, 1940, and June 14, 1941, were required in order to disclose any possible attempts at concealment of real ownership which might have been made between the two dates in anticipation of a general order blocking all foreign assets in the United States.

The United States blockade of the axis was tightened further by the issuance on July 17 of "The Proclaimed List of Certain Blocked Nationals." This and supplementary lists contained the names of suspected, unfriendly persons and firms in Latin America which were to be considered as blocked nationals under the provisions of the executive order of June 14.

On July 25 the United States freezing control was extended to non-European countries. Assets of Japan and China were blocked—the latter at the specific request of the Chinese National government. This step was clearly an aggressive measure taken at a time to coincide with further Japanese occupation of French Indo-China; the principal effect was to bring the trade between the United States and Japan to a complete stoppage. On Dec. 9 Thailand was added to the list of frozen countries, and on Dec. 26 Hongkong was blocked.

The mechanics of the U.S. foreign funds control remained basically the same as those originally introduced in the spring of 1940. Transactions affecting assets of blocked countries and their nationals were prohibited except as specifically authorized

‡Two types of exchange were set up under decree of July 23, modifying the Venezuelan exchange control system.

in the regulations and licences issued by the United States treasury. Special licences were usually issued, if there was reasonable certainty that the axis would not benefit from the transaction for which the licence was requested, and if it appeared that the blocked national would suffer were the licence denied. General licences were issued to cover transactions which, because of their nature or because of some characteristic of the owners, could be treated as a class. For example, general licence 11 permitted blocked nationals to withdraw funds not to exceed $500 in any one month for necessary living, travelling and similar personal expenses in the United States, while general licence 53 permitted all transactions ordinarily incident to the importing and exporting of goods between the United States and the generally licensed trade area provided the transaction was not by or on behalf of any blocked country or national thereof not within the generally licensed trade area or any person whose name appeared on the Proclaimed List of Certain Blocked Nationals.

Orient.—With the active co-operation and assistance of the American and British governments (and to a lesser extent of other Allied governments), the Chinese National government was able to strengthen materially its control over the foreign exchange transactions of the unoccupied areas of China. Simultaneously with the freezing of Japanese assets, the United States and Great Britain blocked Chinese assets under their jurisdiction. This measure gave the Chinese National government some control over the dollar and sterling assets of Chinese residents, including those in Shanghai, and thereby facilitated the closing of that centre as a leak for Japan in the Chinese exchange control system.

On Aug. 18 the Chinese Currency Stabilization board, which was set up under stabilization agreements signed in April with the United States and Great Britain, authorized 14 licensed banks in Shanghai to provide dollar or sterling exchange for normal trade requirements at official rates. These banks had agreed to cease operations in the free market in return for an undertaking by the stabilization board to provide them with dollars and sterling at fixed rates and within certain limitations in respect of permitted imports. The rates were fixed at 3 5/32 pence and 5 5/16 cents to the yuan, giving a cross dollar sterling parity of 4.04, the official buying rate for pounds sterling in New York. This undertaking narrowed the market in Shanghai for free exchange and, for the first time since March 1938, strengthened the position of the Chinese yuan against speculative operations. By a series of decrees and regulations, operations in the free market were confined by the end of 1941 to clearing import bills not covered by a licence from the Chinese Foreign Exchange Control commission. This commission was set up in September to pass upon individual applications for exchange. This system of licensing each individual transaction involving the expenditure of either U.S. dollars or sterling exchange enabled the Chinese National government to prevent exchange disbursements of free China from making their way into Japanese or Japanese-controlled channels. This was not possible before, when efforts to support the Chinese yuan had to be made in the free market.

Japan immediately retaliated for the freezing of Japanese assets abroad. On July 26 a freezing ordinance was announced which provided that designated foreign nationals might not acquire or dispose of certain property or perform certain acts, except by permission of the ministry of finance. Orders freezing the assets of U.S., British and Dutch nationals in Japan were immediately issued under the above order. This was shortly followed by similar orders of Japanese-sponsored governments in occupied areas of China.

The Japanese freezing orders had been preceded during the early months of the year by a number of measures designed to tighten the Japanese exchange control system so as to provide exchange for imports from non-yen countries. In Feb. 1941 the Japanese foreign exchange law was amended giving the government authority to order Japanese nationals to sell their foreign assets, and also giving the government authority over the acquisition and disposal of property in Japan by foreigners and foreign corporations. On March 24 the finance minister issued a decree requiring all holders of blocked assets outside the yen-bloc to submit monthly reports to the ministry of finance giving full information regarding such assets. The reason given for this action was to enable the Japanese government to protect these assets through diplomatic negotiations.

Effective June 1, Japan instituted a system to stabilize the yen-sterling exchange. This was to be accomplished by centralizing all forward exchange operations in sterling and sterling-allied currencies (British, Australian, Egyptian, South African and New Zealand pounds, Straits and Hongkong dollars and Indian rupees) in a collective account maintained by the Yokohama Specie bank. Under this arrangement, the Japanese government indemnified the foreign exchange banks and traders for losses incurred in connection with foreign exchange transactions in these currencies; all profits and losses accrued to the Japanese government. On July 1 this foreign exchange concentration system was extended to include operations in United States dollars and currencies of 11 other non-sterling countries: Philippine Islands, Canada, Brazil, Argentina, Netherlands East Indies, French Indo-China, Switzerland, France, Sweden, Germany and Italy. This measure centralized the whole body of foreign exchange transactions between the yen group and other currencies.

The Sterling Area.—The British government had established virtually complete control over Britain's foreign exchange transactions before the close of 1940; it had instituted rigid controls over exchange proceeds from

exports, had closed all but the smallest leaks for capital exports, and had virtually abolished the free market for sterling. This was accomplished through an extensive series of payments and clearing agreements; the effect has been to sectionalize Britain's exchange market and to canalize its international economic and financial transactions.

The year 1941 saw no major changes in the British exchange control regulations and procedures. To reduce the importation of British bank notes into the United Kingdom, the right to do so was restricted on Feb. 1 to bona fide travellers. To preclude temporary exports of capital, the regulations were amended in April to provide that, in the absence of a specific exemption from the treasury, satisfactory assurance must be given that payment would be received within six months before a licence to export would be granted. To stop the leakage of sterling through other parts of the empire into dollars or other "hard" currencies, all transfers of funds from the United Kingdom to other parts of the sterling area were made subject on June 16 to the same degree of control, and to the same procedure, as transfers to countries outside the sterling area. Leaks had previously been possible as a result of the freedom of transfer of sterling within the sterling area, together with the lack of uniformity in exchange control systems throughout the area.

To prevent evasion of the United States order freezing axis assets, by operating through dollar accounts emanating in London, Great Britain issued a regulation on June 15 prohibiting, except by prior permission of the Bank of England, all withdrawals of U.S. dollar balances held on behalf of persons not resident in the sterling area.

Apart from co-operative steps taken against the axis, the most important British exchange-control development during 1941 was the widening of the sterling bloc. The Belgian Congo and Ruanda-Urundi, territories under control of the council of defense of the French empire, Hongkong, Iceland and the Faroe islands were formally included during the year. Iraq, which because of political and military developments was excluded on May 6, was again brought in on Nov. 28. The British empire, excluding Canada and Newfoundland, together with Egypt and the Anglo-Egyptian Sudan, was the nucleus about which the sterling bloc developed.

On Jan. 21 the Anglo-Belgian trade agreement was signed. It provided for the inclusion of the Belgian Congo and Ruanda-Urundi in the sterling area at a rate of exchange of 176.625 Congolese francs to the pound. On March 29 an order was issued formalizing the temporary financial arrangements between the United Kingdom and the free French territories at the same rate of exchange. The entrance of these areas into the sterling bloc automatically extended to them the general scheme of exchange control operating in the United Kingdom. Iceland and the Faeroe islands also entered the sterling area on March 29; Syria and Lebanon entered in September. Hongkong was brought in on Aug. 1, in order to facilitate the joint Anglo-American-Chinese financial blockade of Japan.

On Aug. 16 Great Britain and the U.S.S.R. signed a financial agreement setting forth the terms of payment for trade between the sterling area countries and the U.S.S.R. Clearing machinery was subsequently established providing for the settling of balances quarterly, 40% in gold or U.S. dollars and 60% in sterling.

Some progress was made during 1941 toward eliminating the discrepancies between the various controls within the sterling area, and in bringing them into line with that of the United Kingdom. As a consequence of the tightening of the control systems and the narrowing of the free exchange market, the fluctuations in the "free" rates of exchange on the various sterling area currencies were negligible during the year and the margin between the free and the official rates was virtually nil.

Canada.—Only minor amendments were made in the Canadian exchange regulations during 1941; they were directed toward decreasing further the drain on Canada's U.S. dollar exchange resources and, to a lesser extent, toward diverting foreign exchange expenditures to sterling currencies.

Effective Jan. 1, 1941, travel abroad was prohibited except by permission of the Foreign Exchange Control board, and on Jan. 7 prepayment for imports was restricted. In January, arrangements were made with authorities of the British possessions in the western hemisphere to provide the necessary funds for travel to those areas via New York, and on Feb. 15 an order was issued authorizing the granting of permits to import certain goods from countries outside the sterling area, provided arrangements approved by the Exchange Control board had been made for payment for such goods in sterling. On July 25 Canada froze the accounts in Canada of residents of Japan and China.

Europe.—Changes in the exchange situation of continental Europe during 1941 arose out of a continuation and extension of earlier practices and policies. They were the financial counterpart of Germany's economic subjugation of areas directly or indirectly under its control. Unlicensed exchange operations in all continental European currencies were stopped in the New York market by the U.S. freezing order of June 14. The volume of exchange operations, of course, materially declined.

The lowering of import duties between various European areas, the relaxation of payment restrictions, the tightening of currency regulations, and the further extension of central multilateral clearing through the German clearing office in Berlin were the steps taken during 1941 to further the creation of a continental economic bloc under German supremacy. Effective Jan. 1, German goods imported into the Netherlands were exempt from import duties. On April 1 foreign exchange restrictions were removed and the German-Netherlands clearing accounts closed. This latter measure virtually established a regime of free payments and of free transfer of capital between the two countries; it did not disturb existing arrangements for clearing payments between the Netherlands and third countries through the Berlin clearing office. By proclamation of April 12, imports into Bohemia-Moravia from the Netherlands no longer required exchange permits.

The network of payments cleared through Berlin was widened during 1941. Arrangements were made during the year to clear through the Berlin clearing office payments between Belgium and five additional European countries, and also payments between Rumania and Greece and between Rumania and Yugoslavia on obligations arising after June 1. The terms of the Hungarian-German trade and clearing agreement reached in July have not been published (Jan. 1, 1942) but it is reported that the agreement provided for an enlargement of clearing account facilities. Four occupied territories (General Government of Poland, Norway, the Netherlands and Belgium) made regular use of the central clearing facilities in Berlin throughout 1941, and 12 formally independent countries (France, Italy, Slovakia, Hungary, Rumania, Yugoslavia, Greece, Bulgaria, Switzerland, Sweden, Denmark and Finland) used the facilities occasionally. No direct clearings between German-occupied countries were allowed.

Finland, by a law of May 9, confirmed the existing authority to regulate foreign exchange transactions and broadened the scope of the specifically authorized governmental activities in this field. The new law centralized all foreign exchange transactions in the Bank of Finland and empowered the bank to require the surrender or transfer of foreign currencies, gold or other metals.

A royal decree of June 20 extended until June 30, 1942 the Swedish foreign exchange law of 1939, granting a monopoly of foreign exchange and foreign security transactions to the National Bank of Sweden during a war crisis.

Latin America.—Large foreign purchases, particularly by the United Kingdom and the United States, of many industrial and agricultural raw materials produced in Latin America, were primarily responsible for the improved balance-of-payments position of most of the Latin-American countries during 1941. This improved balance-of-payments position was immediately and directly reflected in more favourable exchange conditions.

Increased sales of wool to the United States and of meat to the United Kingdom, coupled with a reduction of imports, accounted for the improvement in the foreign exchange position of the Argentine during 1941. The easier situation was manifested in the simplification and relaxation of the exchange control system. On July 1, 1941 Argentina abolished its exchange control office and also the prior permit system for a number of commodities which usually comprise about 80% of its imports. Under the old system a prior exchange permit was a prerequisite to importation; under the revised control, import permits were no longer required for purchases from the sterling area, from other countries employing blocked currencies, from contiguous territories, or for essential products from free exchange countries.

Higher coffee prices under the Inter-American Coffee agreement was an important factor in easing the Brazilian foreign exchange position during 1941. The unevenness of the improvement was due largely to the dearth of coffee export bills in the late spring and in August. At these times the market was cushioned by bills arising from exports of minerals, vegetable oils and other products.

By late spring of 1941, Bolivia's exchange situation was more encouraging than it had been; sufficient dollar exchange was available to meet practically all demands and, as a consequence, the curb market had virtually disappeared. By decree of June 21 a single exchange rate of 46 bolivianos to the dollar was established. Revaluation of gold reserves and foreign exchange holdings of the Central bank resulted in a profit of 184,000,000 bolivianos.

Peru had sufficient dollar exchange to meet all necessary mercantile and service requirements. In contrast to the easy dollar position, Peru was short of sterling during most of the year.

The Venezuelan exchange control system was modified by the decree of July 23, which established a legal exchange market in that country for the first time and depreciated slightly the controlled selling rate.

The plentiful supply of dollar exchange in Uruguay during the latter half of the year was reflected in the drop of the free rate to the lowest level in many years.

Chile sought a solution to its exchange difficulties by increasing the number of commodities coming in at the higher rate. Exchange at the higher free rate was adequate throughout the year but exchange at the lower export draft rate was scarce.

The exchange policy of British colonial possessions in Latin America was governed by British war needs and the control systems were patterned after that of the sterling area. Trade was directed toward the sterling area bloc and dollar exchange was made available for imports from the United States only if the commodities were deemed essential and could not be obtained from the British empire.

Cuba, the Dominican Republic, El Salvador, Guatemala, Haiti, Mexico, Panama and Peru were the only Latin-American countries which did not have formal exchange control systems. (*See* also GOLD.)

Exchange Stabilization Funds.

The most significant development in this field during 1941 was the establishment of the Chinese-American and the Chinese-British stabilization funds to stabilize the relationship between the Chinese yuan and the U.S. dollar and the British pound sterling, respectively. Separate, but closely parallel, agreements were signed in April between China and these countries. The agreements provided for the appointment by the Chinese government of a five-man board (three Chinese, one American [U.S.] and one British national) to manage the funds. Under the agreement with Great Britain, the British treasury

agreed to provide 5,000,000 pounds sterling in addition to the existing Sino-British Stabilization fund which was set up in 1939. The agreement with the United States called for the purchase by the U.S. Stabilization fund of Chinese yuan to the amount of U.S. $50,000,000, and for a contribution by Chinese government banks of U.S. $20,000,000 to the joint fund. The Stabilization board began operations in August.

An earlier, repeatedly renewed, arrangement between the United States and China, signed on July 14, 1937, also provided for stabilization operations in Chinese yuan.

The United States also entered into stabilization agreements with Mexico, Brazil and Argentina. The agreement with Mexico was signed on Nov. 19, and provided for the use of $40,000,000 of the U.S. Stabilization fund to stabilize the U.S. dollar-Mexican peso exchange rate; this undertaking has not yet (Jan. 1, 1942) gone into effect. The United States-Brazilian Stabilization agreement, signed on July 15, 1937, and modified on Sept. 2, 1938, is still active. The undertaking with the Argentine, signed on Jan. 1, 1941, was not operative (Jan. 1, 1942), because of the failure of the Argentine congress to ratify and confirm the agreement. Under this arrangement, $50,000,000 of the U.S. Stabilization fund was set aside to promote stability between the currencies of the two countries.

On Aug. 15, Russia received $10,000,000 from the U.S. Stabilization fund against gold to be delivered within 90 days, and on Oct. 10, an additional $30,000,000 against gold to be delivered within 180 days. These were the first two instances in which the U.S. treasury purchased gold for future delivery.

Exchange controls in Europe and the British empire eliminated the need, so far as concerns these areas, for customary stabilization fund operations. There were no stabilization funds in operation in Europe (Jan. 1, 1942) and the stabilization funds of Great Britain and Canada were virtually inactive since the beginning of the war. The pre-war resources of the British Stabilization fund were virtually exhausted during the first two years of hostilities; gold held in the fund fell from $2,038,000,000 on Sept. 1, 1939, to $151,000,000 on Sept. 1, 1941. Exploration and Discovery.

Arctic.—Although the usual program of northern exploration, both private and government-sponsored, was upset by the war, this did not mean that the Arctic lay disregarded, awaiting the coming of peace for a resumption of activities.

In fact, never before had so many people in so many countries been conscious of the importance of the Arctic in the world scheme.

Greenland.—Commercial relations between Greenland and the United States, which had been established during 1940 by the sending of a Greenland trade commission to the U.S. and the maintenance in Greenland of a United States consulate, were continued during 1941.

On April 10 it was announced from Washington that the Danish minister, Henrik de Kauffmann, had placed Greenland under the protection of the United States, giving the U.S. the right to establish air bases and other naval and military facilities on this strategic island. This action was taken by the minister "on behalf of the king of Denmark," who, it was assumed, could not exercise his sovereign powers so long as Denmark remained under German occupation.

The pact was to remain in force for 12 months after "it is agreed that the present dangers to the peace and security of the American continent have passed."

Military considerations necessitated secrecy with regard to what steps the United States had taken for the protection of Greenland, what bases might have been established there and the extent of reconnaissance work done. But that these activities extended to the east coast as well as the west was known from an announcement in the newspapers on Oct. 12 that a U.S. naval vessel had intercepted and brought to Boston a German-controlled Norwegian sealing ship which had established and was apparently attempting to provision a radio station somewhere on the east coast.

It was further stated that this station had been dismantled and its equipment and personnel carried away.

An expedition under the leadership of Louise A. Boyd, in the "Effie M. Morrissey," Captain Robert A. Bartlett commanding, made a summer trip to Greenland waters to study the rarefied layers that are from 50 to 300 miles above the earth. The findings will no doubt be of importance to long-distance radio transmission. Commander Donald B. Macmillan made his 19th expedition to west Greenland waters, this one announced as a summer trip sponsored by the New England Museum of Natural History for the purpose of making a collection of Arctic birds.

Spitsbergen.—Another scrap of news regarding northern wartime activity relates to the raiding of Spitsbergen by joint British and Canadian forces. It was announced, and further confirmed by widely published photographs, that radio stations had been dismantled and the valuable Spitsbergen coal mines, property of Norwegians and of the soviet government, rendered unfit for use. The 1,000 or more inhabitants of Spitsbergen, mostly Norwegian and soviet coal miners and their families, were removed.

U.S.S.R.—As a part of the program of scientific study of the polar basin, in connection with the operation of the northern sea route, a soviet expedition landed April 4 on floe ice near the Zone of Inaccessibility, the centre of which was defined by Stefansson in 1921 as being near 84° N., 160° W., the so-called Pole of Inaccessibility. The plane was piloted by I. I. Cherevichny, veteran polar flyer, and carried three scientists and a crew of six. They left Moscow on March 3 and flew in stages—passing over the northern sea route to Wrangel island, thence 650 mi. north of 81° N. Lat., 180° E. Long., where a floe base was established. Here, some 200 mi from the Pole of Inaccessibility, the party stayed for several days, studying ice, water and weather conditions. Extensive flights were made over surrounding areas.

The operation of the northern sea route, which had become well established, was, no doubt, continued as usual, but no figures were released on the number of ships that completed the passage nor of tonnage carried. The soviet government maintains in connection with this route a network of Arctic meteorological and scientific stations; planes scout overhead, observing ice conditions and indicating the most favourable routes for ships to follow; ice-breakers convoy the fleets of freighters, to force a pathway through ice that cannot be avoided.

Alaska.—On Oct. 25, 1940, the Japanese government notified the United States, Great Britain and the U.S.S.R. that she was abrogating the treaty regarding the fur seals of the Pribilof islands, effective one year later. The treaty had been signed by the four powers in 1911 when unrestricted slaughter of these valuable animals had reduced their estimated numbers to 123,600 and their extinction was feared. After a period of years during which no sealing was permitted, the treaty provided for United States control of the sealing operations, with vessels patrolling the waters surrounding the Pribilofs, and supervision of the killing, which was restricted to surplus three-year-old males. Under this policy the herds had by the last census increased to 2,185,000 animals. Legally Japan's abrogation took effect Oct. 25, 1941.

In June 1941, Amos Burg left Portland, Ore., in a 38-ft. sail boat with auxiliary engine for an extended study trip to Alaska. His itinerary included the 1,100-mi. inland passage, and extended well beyond this into Bering sea. Soundings were taken along the route. On Nunivak island he made a motion-picture film of Eskimo life; a second film was secured, dealing with Alaskan resources.

Canada.—In 1941 T. H. Manning returned from a five-year expedition to the eastern Canadian Arctic which included the mapping of Southampton island, at the entrance to Hudson bay. In the winter of 1940-41 Manning crossed Baffin island from Bowman bay on the southwest via Nettilling lake to Pangnirtung on Cumberland sound.

The Hudson's Bay company's ship "Nascopie" made its annual patrol of the eastern Arctic, taking supplies and change of personnel both to their own posts and to the various outposts maintained by the dominion. As usual, government officials accompanied the ship for scientific and inspection purposes.

Mr. and Mrs. A. L. Washburn flew from Edmonton in March 1940, to Cambridge bay, Victoria island, where they carried on geological work until the spring thaw. During the summer they flew to a number of places in and around Victoria island. In August they went by the trading schooner "Aklavik" to Terror bay, King William island, where they stayed until early in December. They then made their way back to Cambridge bay via the mainland; thence they travelled overland to Richardson island, off the south coast of Victoria island, where they were picked up in Feb. 1941, by a Canadian Airways plane which brought them back to the United States.

The American Geographical society expedition to the Yukon, under the leadership of Walter A. Wood, reported successful ascents of Mount Walsh and of Mount Wood, 15,880 ft., during the summer of 1941. Provisions for the mountain parties were dropped by parachute at selected bases. The expedition's work included also mapping flights and geological investigations.

Antarctic.—The work of the United States Antarctic Service expedition was concluded during 1941. During the Antarctic spring and summer of late 1940 numerous flights for exploratory and mapping purposes were made from both the west and east bases—west base, Bay of Whales, under command of Dr. Paul A. Siple; east base, near Neny island, Marguerite bay, commanded by Richard B. Black. Sledging operations, both for surveying and to establish supply depots, were carried out by parties from both bases; those from the west base included the setting up of aviation gasoline caches by means of an army tank and tractor. These and earlier operations resulted in the aerial mapping of the longest unknown coastline in the world, extending between the east and west bases, tied-in with ground observations of surveyors travelling by dog and motor sled. The expedition determined the insularity of Alexander the First Land, a region now shown as a pear-shaped island, 300 mi. long and 120 mi. wide.

The evacuation of the west base began when the "Bear" reached the Bay of Whales on Jan. 11, 1941, followed by the "North Star" on Jan. 24. After taking the west base party on board, the ships left the Bay of Whales on Feb. 1 and headed toward the east base on Palmer peninsula. Dense

pack ice prevented entry into Marguerite bay and the ships proceeded northward to Dallman bay, to await favourable ice reports from the east base. The unfavourable conditions persisted, as was revealed both by scouting flights from the base and by attempts to penetrate by ship. Finally the ships separated, the "North Star" with the east base party heading north for the Strait of Magellan, while the "Bear" continued attempts to reach the east base. Bad weather and difficult ice conditions still continuing, and winter approaching, an emergency evacuation by air was decided upon. The "Bear" proceeded to Mikkelsen island, small and snow-covered, about 112 mi. from the base. Here a suitable area for aircraft operations was located and a landing field prepared. The 26 men of the party, with their records and scientific specimens, were brought to Mikkelsen island on March 22 in two flights of the east base Condor plane. All equipment was left behind for the use of some future expedition; the plane itself was abandoned atop the plateau of the island. The "Bear" sailed at once for Magallanes, Chile, where it met the "North Star" on March 29; the "Star" reached Boston on May 5 and the "Bear" on May 18.

In addition to the extensive aerial and land survey, through which 1,000,000 sq.mi. of territory were said to have been charted, the work of the score of biologists, meteorologists and other scientists on the expedition staff was expected to yield valuable results. Export-Import Bank of Washington.

The Export-Import Bank of Washington, an agency of the United States, was established on Feb. 12, 1934, for the purpose of financing and facilitating trade relations between the United States, its territories, insular possessions and foreign countries. By an act of congress approved Sept. 26, 1940, the Export-Import bank was to continue as an agency of the United States until Jan. 22, 1947, or such earlier date as might be fixed by the president by executive order. By this act it was also granted specific authority to make loans which would assist in the development of the resources, in the stabilization of the economies, and in the orderly marketing of the products of the countries of the western hemisphere.

The bank in 1941 had lending authority of $700,000,000. Its capital consisted of $1,000,000 of common stock and $174,000,000 of preferred stock. All common stock, except 11 shares standing in the respective names of the trustees, was held jointly by the secretaries of state and commerce in their official capacities. All of the preferred stock was purchased by the Reconstruction Finance corporation. Its governing body was a board of 11 trustees representing the departments of state, treasury, commerce and agriculture and the Reconstruction Finance corporation.

The bank had authorized since its creation $837,705,261 of loans to the end of 1941 as compared with $654,780,863 to the close of 1940. Actual disbursements in 1941 amounted to $116,835,507 against $95,298,476 in the previous year. Outstanding loans at the end of 1941 were $186,130,456 as compared with $131,031,867 at the end of the previous year. Net earnings during 1941 were $7,216,129, whereas in 1940 they amounted to $3,774,591.

During the year 1941 because of the international situation the Export-Import bank's new commitments were confined largely to Central and South America. The bank's facilities were used to finance the construction of highways, electrical plants, a steel mill in Brazil; to assist in the processing of wild rubber, the storage and sale of sugar, and many other projects, all contributing to the development of the resources of the respective countries involved and directed toward the encouragement of Central and South American countries to produce their requirements and the vital needs of the United States. (W. L. Pi.)

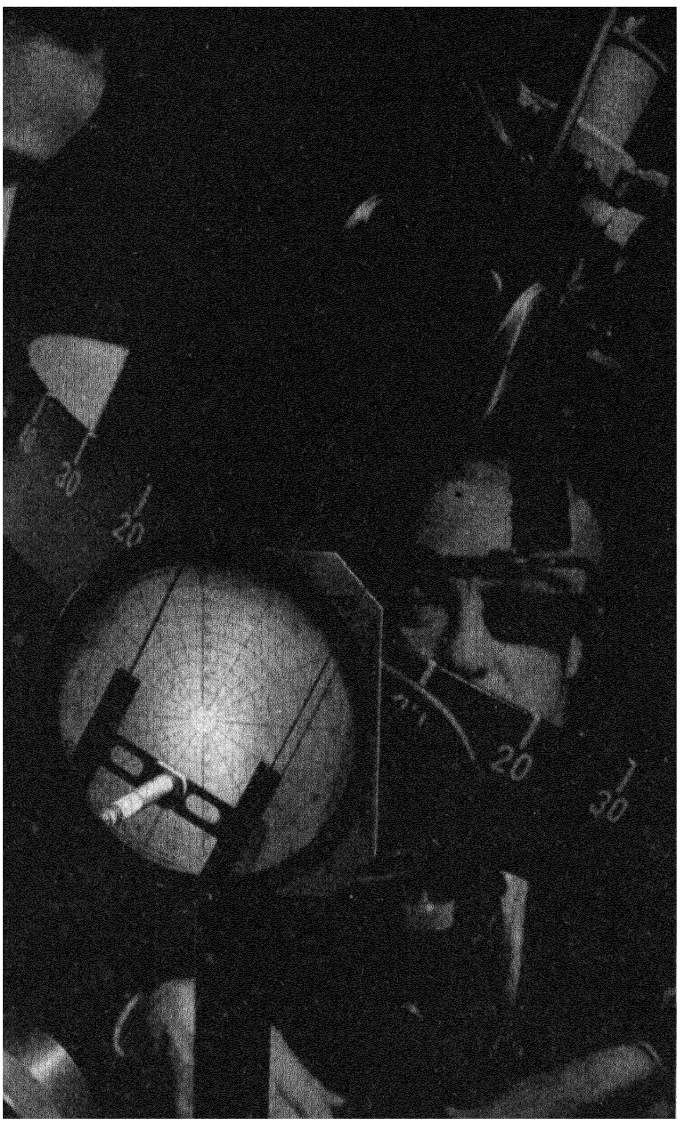
Eye, Diseases of.

Cataracts.—One of the commonest causes of loss of vision is cataract or opacity of the crystalline lens of the eye. While many times the cause of cataract can be traced to some disturbance in the body such as diabetes, parathyroid gland disease, damage due to exogenous toxins, a cause cannot be found in most cases. In cases in which some metabolic disturbance is discovered, the mechanism of cataract formation remains obscure. It is an irreversible process, since remedy of the causative factor leads to little if any change in the already formed lens opacities. The only treatment of value in restoring visual loss due to cataract is the surgical removal of the opaque lens.



INSTRUMENT which measures a glaucoma victim's field of vision and thus determines the extent of damage to the retina. In 1941 about 120,000 U.S. citizens were totally or partially blind as a result of glaucoma

For many years ophthalmologists have known that the injection of concentrated solutions of some substances into experimental animals will oftentimes produce cataracts. From the departments of ophthalmology and chemistry of Northwestern university medical school has come the report of carefully controlled research on this phenomenon. Bellows and Chinn were able to produce cataracts in dogs and albino rats by the intravenous administration of hypertonic solutions of sodium chloride, sodium sulphate, lithium chloride, galactose, arabinose, xylose, glycerin, ethylene glycol, amino-acetic acid, sodium lactate and ethyl alcohol. The reaction appears to be due to the hypertonicity rather than to the chemical nature of the solution. Their studies indicated rather conclusively that these cataracts are due to a change from normal of the osmotic balance on the two sides of the capsule of the crystalline lens. They produced evidence that

many clinical forms of cataract are due to an osmotic imbalance coincident with either disease or age.

These studies, and others being carried on, did not offer any new form of treatment for cataracts. However, they were extremely valuable in that they are leading to a clearer understanding of the processes of cataract formation. This must precede any medical treatment of cataracts aimed at their prevention, arrest or improvement.

Vitamin C in the Treatment of Corneal Inflammation.—Two eye physicians of the R.A.F., T. K. Lyle and D. W. McLean reported a series of cases of varied types of corneal inflammation which responded very poorly to local treatment, but which showed dramatic improvement following intravenous injections of ascorbic acid (vitamin C).

Vitamin C is known to exist in high concentration in the human cornea. It belongs to a group of substances known as redox potentials. These act as either oxidizing or reducing agents. Either oxidation or reduction, whichever is called for, might be speeded by the presence of an excess of ascorbic acid in a tissue. Hence, corneal metabolism might be accelerated to the benefit of corneal inflammation by an excess of it in the cornea. Acting on this theory, Lyle and McLean used ascorbic acid intravenously in treating keratitis with marked success. Thus a new treatment which appeared promising was added to the present therapy of corneal inflammation.

Vitallium Implants.—When the ophthalmologist finds it necessary to remove an eyeball, he must think of the future appearance of the artificial eye. To prevent unnatural folds, depression and drooping of the lids and sinking of the artificial eye, and to obtain the maximum motility of the artificial eye, most ophthalmologists feel that something should be implanted in the socket to fill out the space formerly occupied by the eyeball. Gold and glass ball implants have been most widely used, but both have disadvantages. Pure gold is too soft for a satisfactory implant. Gold alloys contain less than half gold and are subject to chemical decomposition. Glass may shatter from erosion or possibly from injury.

A wholly satisfactory substance for implants seems to have been found in vitallium. It is an alloy of cobalt, chromium and molybdenum. It is stronger, lighter and cheaper than gold. It is chemically inert and causes no tissue reaction.

Treatment of Retinitis Pigmentosa.—Retinitis pigmentosa is a chronic progressively degenerative disease of the retina of the eye characterized by night blindness, contraction of the visual fields and dimness of vision. It is often found in several members of a family. An effective treatment for the condition has not been available.

A report in 1941 told of a series of six cases of typical retinitis pigmentosa which were treated with injections behind the eyeball of 0.1% atropine sulphate solution. The patients were followed for a period of two years. Two of the patients showed definite improvement. The condition was apparently arrested in one case. The remaining three did not seem to benefit.

In a condition such as retinitis pigmentosa, these results may be considered as quite satisfactory. The results appear to be caused by an increase in blood supply to the retina caused by the retrobulbar injections.

Pilot Fitness.—Major General James E. Fechet (retired), formerly chief of the U.S. army air corps, said in discussing the causes of aeroplane crashes that in over half the cases these are due to personnel error or to undetermined causes. In the personnel group he included the pilot, the weatherman, the air-line operations manager and the mechanic. The pilot's eyesight is of obvious importance.

An instrument called the tachistoscope, which had its origin during World War I, was improved and brought into use again because of the demand for sensitive tests of visual function in pilots. It measures the speed of adjustment of the eyes for change of distance, the speed of accommodation, the speed of adaptation for differences of illumination and the rapidity of ocular fatigue. (*See* also VITAMINS.)

Fadden, Arthur William (1895–), Australian politician, was born April 13 in Ingham, Queensland, Australia. A Queensland accountant, Fadden won a seat in the Australian house of representatives in 1936. He was acting prime minister while Robert Gordon Menzies was representing Australia at London conferences in 1941. Growing Australian dissatisfaction with Britain's conduct of the war led to the downfall of the Menzies government, and Fadden became prime minister on Aug. 28, 1941. At the same time he was unanimously elected leader of both the Country party (his own party) and the United Australian party. But foes of the Menzies regime contended that the new Fadden government was merely a continuation of the Menzies government, and on Oct. 3, 1941, Fadden's cabinet fell after a tenure of only 37 days.

Fair Labor Standards Act: *see* CHILD LABOUR: *United States.*

Fairs, Exhibitions, Expositions. In 1941, due to world conditions, no major fairs were held. Several had been projected but were abandoned. The two great fairs of 1940 were the New York world's fair, in New York, and the Golden Gate exposition at San Francisco, Calif. Demolition of these two gigantic projects was completed in 1941. In New York, the site of the world's fair was rapidly being developed into a 1,200-acre public park. In San Francisco, the site of the Golden Gate exposition was being developed into an aeroplane field.

It has been the history of major expositions to take and develop wastelands, swamps, etc., as sites, using the planning and building of the exhibitions in reclaiming such wastelands, which become public parks, such as the San Diego exposition of 1915–1916, developed into Balboa park; Chicago world's fair of 1933–34, developed into Burnham park, and the Columbian exposition of 1893, developed into Jackson park, in Chicago, Ill. (L. SK.)

Falk Foundation, The Maurice and Laura, of Pittsburgh, Pa., under its policy of devoting its resources to financing research studies of the factors affecting American industry, trade and finance, turned its attention in 1941 chiefly to economic problems arising out of the defense program. Under the foundation's grants, the Brookings institution, Washington, D.C., published in January a short study entitled *Fundamental Economic Issues in National Defense* and then projected its research on problems of the economics of defense into a series of pamphlets, of which the following two were published: *Effects of the Defense Program on Prices, Wages, and Profits* and *Curtailment of Non-defense Expenditures.* In order to stimulate widespread interest in the findings of these studies, the Falk foundation purchased and distributed, without charge, approximately 350,000 copies. Another pamphlet disseminated widely by the foundation was *America's Factories*, published by the Public Affairs committee as a summary of *The Output of Manufacturing Industries, 1899–1937*, a study by the National Bureau of Economic Research under a Falk foundation grant.

Other activities of the foundation during 1941 included appropriations of $60,000 to the Brookings institution for its general support over a two-year period and $10,000 to the Carnegie Institute of Technology, Pittsburgh, for the annual support of the Maurice Falk Professorship of Social Relations, pending payment of the foundation's $300,000 endowment-grant for the professorship. (J. S. G.)

Falkland Islands: *see* BRITISH EMPIRE.
Farm Credit: *see* AGRICULTURE.
Farm Credit Administration: *see* FARM MORTGAGES; FEDERAL LAND BANKS.

Farmers' Co-operatives. The number of farmers' co-operative marketing and purchasing associations in the United States was 10,700 in 1940, to which 193 new associations were added up to the end of the fiscal year, June 30, 1941, the U.S. Farm Credit administration reported in its annual review of farm co-operative activities. The number of farmers' co-operatives has remained almost constant since 1936, the administration reported, and included a membership of 3,000,000 farmers whose associations did a combined business of slightly more than $2,000,000,000 annually. Purchasing co-operatives are the largest in number, 2,649 associations. Grain

marketing co-operatives numbered 2,462. Other marketing associations included dairy co-operatives, 2,395; fruit, vegetable and nut associations, 1,139; livestock, wool and mohair associations, 978; cotton, 536; poultry and eggs, 181. Farm co-operative or mutual fire insurance companies had $12,500,000,000 fire insurance in force, the review asserted, and 63 specialized windstorm mutuals had about $4,000,000,000 of insurance in force. The annual review pointed out a tendency to merge local dairy co-operatives. The co-operative research service division of the Farm Credit administration, which carries on studies of co-operative problems, reported on merchandise trends which affect farm co-operatives, especially co-operative canneries. These, the report points out, are adapting themselves to merchandising changes, which include a trend toward a greater use of dealer brands on canned goods, rather than the brand of the packer; the great increase in the consumption of tomato and fruit juices, the expanding business in frozen foods and the effect of the large city supermarkets. See June 1941 number of *News for Co-operatives*, monthly publication of the Farm Credit administration, for annual review of farm co-operatives in the United States.

(S. O. R.)

Farm Income. United States farmers received in cash from the marketing of products and from government payments in 1941 the largest income since 1929; it was estimated by the department of agriculture as $11,200,000,000, compared to $9,100,000,000 in 1940. The 1941 total was about $100,000,000 less than the 1929 income, but almost $400,000,000 above the average annual income of the period 1924–29. In Dec. 1941, the department of agriculture forecast the cash farm income of 1942 as $13,000,000,000. The increased income would come, it was reported, from expanded industrial activity and from the lend-lease program of greater exports of "food for freedom." From March 15, 1941, when the agricultural department's expanded lend-lease buying program began, to Dec. 1, this governmental wartime outlet for farm products contributed more than $500,000,000 to the 1941 farm income. Although such supplies were predominantly for export to Britain, a part was available for Red Cross and other relief purposes.

U.S. Lend-Lease Purchases of Food, March 15 to Dec. 1, 1941

Commodity	Quantity	F.O.B. cost
Meat products		
Lard	308,665,756 lb.	$31,831,664
Pork meat products, canned	209,202,592 lb.	67,684,022
Pork meat products, cured and frozen	231,532,881 lb.	42,825,115

Farm Machinery. On the 6,091,000 farms in the United States there are 25 tractors, 15 trucks and 60 automobiles to every 90 farms, according to figures for 1941, published by the department of agriculture. The number of trucks and automobiles on farms has increased but slightly since 1931, but the number of tractors has almost doubled since that time. In 1930 there were 778,430 tractors on the farms in 39 states. Ten years later, the 1940 census, as reported in 1941, showed 1,313,799 tractors on the farms of those states. During that time the number of farms declined at an unusually rapid rate, owing to droughts and the depression which started in 1929; there were 6,812,000 farms in the United States in 1930.

Production of farm machinery in 1941 increased substantially over that of 1940 chiefly because of two factors, increased farm income resulting from increased industrial activity growing out of the national defense program and decreasing supply of farm labour, a result of the enlargement of the army and the larger employment opportunities in industry. Production of farm equipment in 1940 was $488,000,000. The increase over that figure in 1941 was estimated by various authorities as from 15% to 25%. Preliminary estimates by Louis J. Paradiso and John H. Morse of the U.S. department of commerce placed the production of farm equipment in the United States in 1941 at $560,000,-

000, an increase of 16% over that of 1940. An extensive analysis supporting this estimate appears under the names of Paradiso and Morse in the *Farm Implement News*, Chicago, July 24, 1941. Other authorities consider this estimate too low, owing to the fact that farm purchasing power now has a considerable addition from what is termed "off-the-farm income," meaning income that farm owners receive from sources not connected with the farm, such as urban employment of members of farm families and investments by farmers. The volume of this additional farm income is not known exactly, but it is estimated to run close to $2,000,000,000 a year under prevailing economic conditions.

Prices of farm implements advanced only slightly in 1941. While a number of the farm implement manufacturers engaged in the production of war materials under government contracts, the volume was not sufficient to interfere with increased production of farm machinery, which was considered essential to increased production of food and national defense. The industry evidenced considerable concern over the future possibility of material supplies being curtailed by defense needs, particularly of such items as contained rubber. Farm tractors are now almost entirely rubber-tired. A new angle in the utilization of power machinery on farms, and comparable to the safety situation in industry, appeared in June 1941, when the Illinois legislature authorized the state departments of commerce and labour to investigate the causes of accidents in the operation of tractors. (S. O. R.)

Farm Mortgages. The outstanding farm mortgage debt in the United States declined further in 1941, in line with a general trend that has prevailed in most years since an all-time high of $10,800,000,000 in farm mortgages in 1923. At the close of the fiscal year ending June 30, 1941, the 12 federal land banks reported $1,817,937,635 in unpaid principal of outstanding farm mortgages. This was $62,470,370 less than the amount on June 30, 1940. Of the total outstanding June 30, 1941, delinquencies amounted to $282,774,006. In addition, the land banks held $46,103,387 of purchase-money first mortgages, $2,850,493 of purchase-money second mortgages and $59,370,376 of real estate sales contracts and notes. On June 30, 1941, the Federal Farm Mortgage corporation held $230,540,344 in first farm mortgage loans, $399,578,173 in second farm mortgages, $3,369,270 in purchase-money first mortgages, $1,400,970 in purchase-money second mortgages and $10,835,299 in real estate sales contracts and notes.

The 12 federal land banks and the Federal Farm Mortgage corporation together held approximately 40% of the U.S. farm mortgages in 1941, the department of agriculture estimated. The life

Foreclosures of U.S. Federal Lending Agencies
(For fiscal year ending June 30, 1941)

Year	Number of properties acquired	Number of properties sold	Number of properties held
1941	5,515	9,872	18,799
1940	7,871	10,924	23,136
1939	11,188	9,742	26,161
1938	7,756	13,011	23,801
1937	12,330	16,321	28,203
1936	14,948	11,891	30,257

insurance companies, which at one time had more than $2,000,000,000 invested in farm mortgages, had less than $900,000,000 in 1941. Agricultural department authorities, commenting on farm mortgage trends (Sept. 1941) reported that one large life insurance company had endeavoured to increase its farm mortgage investments, but that payment on old loans more than offset the new loans made. The governmental lending agencies reported that foreclosures declined in the calendar year 1941, cash collections increased and many farmers paid out in full prior to maturity. Particularly notable was an increase in sales of government-held (foreclosed) farms in Nebraska and South Dakota and other parts of the great plains area where dust storms and droughts in 1934 and 1936 had resulted in widespread abandonment of farms. (*See* also FEDERAL LAND BANKS.) (S. O. R.)

Farm Security Administration: *see* AGRICULTURE; HOUSING.

Farm Tenancy. The wartime demand for practically unlimited farm production may have the effect of reducing farm tenancy in the United States by providing, with government aid, further means for tenants to become farm owners. The Farm Security administration prepared a program in 1941 to add to defense production by assisting the 600,000 low-income farm families who operate farms with rehabilitation and tenant purchase funds. About 39% of the 6,096,799 U.S. farms in 1940 were operated by tenants. In 1930 the number of farms was 6,288,648, 42% of which were operated by tenants. Government aid in buying farms reduced the number of tenant farmers, but much of the decrease in the decade 1930–40, according to the department of agriculture, was "a change in the status of many sharecroppers in the south to 'wage hands,' 'resident labourers' or regular farm labourers." In 1880 only about 26% of United States farms were operated by tenants. The combined acreage of all farms in the United States in 1940 was 1,060,852,374 ac. and the average size farm was 174 ac. In 1930 the combined acreage of all farms was 986,771,016 ac., and the average size farm was 157 ac. After the start of the national defense program in 1940, some 14,000 farm families were removed from farms in areas purchased by the United States government for proving grounds, manoeuvre areas, bombing fields and other military sites. Several thousand more were to be removed in 1942. (*See* also FARM MORTGAGES.) (S. O. R.)

Fascism. Fascist propaganda worked among the democracies in three ways: It tried to divert attention from the fascist pattern of conquest by raising irrelevant issues and by sowing dissension and distrust among the democratic nations, both within these nations and between the nations; naturally propaganda against "Russian bolshevism" or against "British imperialism" was promoted by all means in the United States, while in Latin America it was propaganda against "Yankee imperialism"; it tried to belittle democracy, or to make the citizens believe that they do not live in a real democracy, but under a dictatorship; this doubt about democracy was raised equally from the rightist as well as from the leftist point of view, depending upon the audiences for which it was destined, all the while forgetting that according to fascist theory democracy was something intrinsically corrupt and decadent and dictatorship something good; the third way, and perhaps the most characteristic one, was supplied by anti-Semitism, by blaming the Jews for the war, as if fascist theory would not praise war as something fundamentally noble and desirable, and branding every resistance to fascism as "Jewish war-mongering." Anti-Semitism at the same time served the purposes of undermining the faith in democracy and the faith in the Judeo-Christian tradition of moral law.

Toward the end of 1941 the violent attacks of fascism were directed more against the United States than against the soviet union or Great Britain. The *Stampa* of Turin, one of Italy's best-known papers, wrote on Oct. 23 of Secretary Hull and President Roosevelt as "throbbing with rage as they use phrases from the ghetto from which the latter has descended."

Fashion and Dress. In 1941 fashions were restrained, practical, inconspicuous. In the warring countries clothing rations were in force—hence fewer clothes were made. In the United States, American designers continued to create—simple, wearable fashions in keeping with the tragic times.

In spring 1941, as a reaction, colour swept the fashion scene. Bright woollens, the brighter the better, were in fashion. Acid greens, South American pinks, reds, pale blues vied with the traditional navy blues. Blouses contrasted with skirts, and skirts were not always the same shade as the jackets. Gaudy woollen snoods competed with hats, and many of these snoods were flecked with paillettes. The suit jackets were often cut with peplums, the skirts were invariably straight and short. The shirtwaist and skirt idea "caught on" and young girls were wearing striped wool jersey middy-blouse tops pulled down over dark pleated skirts.

Summer brought in new play fashions: frontier pants, slim and tapering, instead of flapping slacks; sleeveless waistcoats to wear with slacks and sports skirts; a wave of black and white for the beach or for spectator sports—white sharkskin playsuits with black linen aprons, all black slack suits, black shorts worn with white shirts. College girls began doing their hair in pigtails. Fishermen's espadrilles with tapes crisscrossed up the leg became a rage. The bright printed calico skirts of the southwestern Indians were worn tremendously, short for day, long for evening—the shops called them "broomstick skirts."

In midsummer, when the United States announced an embargo on Japanese silk, a panic hit the hosiery counters in department stores throughout the country. Police were called in to control the crowds of women who rushed in to stock up with precious silk stockings. Manufacturers speeded up the production of nylon hosiery. To wean women away from silk, coloured cotton stockings were launched, and the department of agriculture in Washington, D.C., set to work in its research laboratories to develop cotton meshes, sheer and lacy. Meanwhile the cosmetic industry was experimenting with make-up for the leg, to create the effect of stockings in case the shortage became acute.

The autumn collections produced one startling change in silhouette—the shorter evening dress—which cleared the floor by six or eight or even ten inches, showing the ankle, and throwing a new spotlight on the foot and shoe. These short evening dresses went like wildfire—black satin skirts with black lace blouses, black starched mousseline dresses with ruffled jabots, glazed chintz dirndls for evenings in the south, white lace, pink satin—the variety was infinite. With these short skirts came ballet slippers with ribbons bound round the legs and platform slippers with straps around the ankle to give shorter women height. Old-fashioned rhinestone shoe buckles were revived on simple, low-cut evening pumps.

The autumn fashions twinkled with jet—jet beads and jet bugles were embroidered on suit pockets and lapels, dripped from blouses and evening caps, sparkled throughout all the evening fashions. With jet came multicoloured paillettes as big as dimes and these were sewn on velvet sailor hats, on veils, on scarves and gloves and lace snoods.

Blond furs made their appearance amidst the traditional minks and sables and nutrias, and most particularly Himalayan marten, honey beige in colour, elegant and dressy and luxurious. Fur-lined coats were another extravagant luxury—raspberry red wool lined with Persian lamb, bright lacquer red wool lined with beaver. Oct. 1941 launched a new evening fashion—comfortable warm cashmere sweaters embroidered with pearls and gold or with dead black jet, a necklace effect at the neck, a bracelet of embroidery on one cuff.

World War II.—Meanwhile American women were rapidly getting into the uniforms of the various Red Cross units, the voluntary services and civic defense corps. These uniforms varied in style and in colour, but their tailored simplicity set its mark on all fashion. Practical walking shoes appeared on the streets. The girls who had been wearing their hair in long manes that swept over one eye in imitation of the movie star Veronica Lake began to cut their hair shorter. In the colleges, short curls all over the head became a fad.

When the United States entered World War II the women who were not in active service prepared to see the war out in simple suits made in cheerful colours, in long simple dinner dresses with sleeves or jackets, or the shorter ballet-length evening dresses. (*See* also FURS.) (C. SN.)

Feder, Gottfried (1883–1941), German politician and one of the founders of the nazi party, was born Jan. 27 in Wuerzburg, Germany. In 1919, Feder invited Adolf Hitler to join a political band of 60 men called the German Workers' party, whose avowed goal was to deliver the reich from "grasping Jewish economy" and return it to "creative Aryan capital." In 1922 Feder drew up the original 25-point program upon which the nazi party, successor to the German Workers' party, was founded. From that point on, Hitler took control of the party and upon becoming reichschancellor in 1933, he appointed Feder state secretary in the reich ministry of economics. But Feder's extremist economic theories led to his downfall. In 1934, when the reich was using six kinds of depreciated marks, Feder insisted that Germany was wedded to the gold standard and the stable mark. In Dec. 1934 Feder was placed on the retired list and faded into obscurity as a political figure. He died in Munich, Sept. 24.

Federal Bureau of Investigation. The federal bureau of investigation was founded in 1908 to provide the United States department of justice with a permanent investigative force. In 1924, John Edgar Hoover was appointed director. Although it has been known as the bureau of investigation and later as the division of investigation, its present name, the federal bureau of investigation, is more descriptive of its status as the general investigative agency for the federal government.

The FBI is charged with the duty of investigating violations of the laws of the United States, collecting evidence in cases in which the United States is or may be a party in interest, and performing other duties imposed upon it by law. By presidential directive, the FBI has jurisdiction over espionage, sabotage, neutrality violations and related national defense matters.

During the fiscal year 1941 the investigative activity of the FBI resulted in 6,182 convictions, more than in any former fiscal period. Of these, 412 convictions were secured under the national defense classifications, as compared with 58 such convictions during the year 1940. Since the passage of the Federal Kidnap-

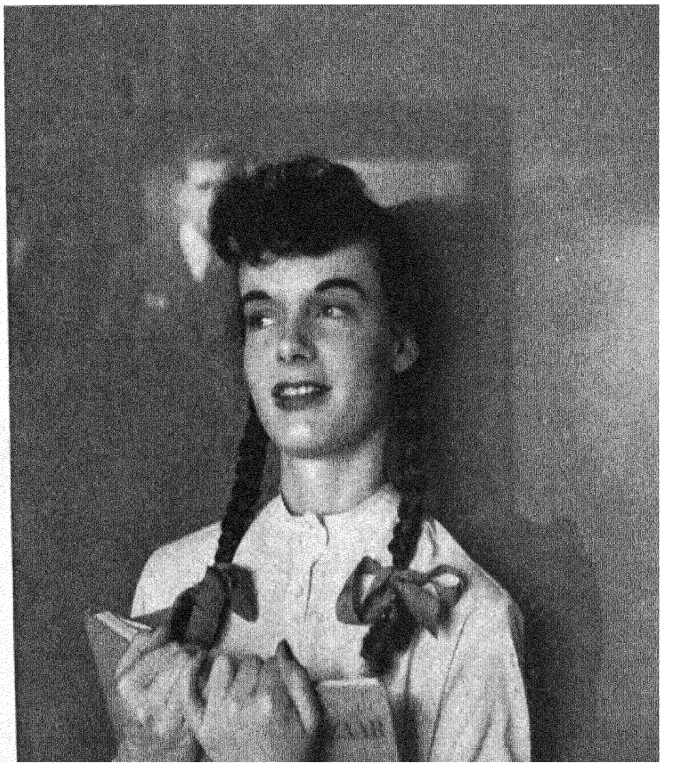
COMPLETE SNOODS, flat in back and wide at the sides, were popular in the fall of 1941

JET BEADS OR PAILLETTES twinkled on many dresses in the autumn of 1941, as on this short dinner dress for restaurants or theatres

Above: PEPLUMS of bullet padding were featured in the spring of 1941

Left: PLATFORM-SOLE SHOES with mesh ties, designed for street use in 1941 by Fritz Henle

Below: A FAD AMONG COLLEGE GIRLS in 1941 was a coiffure of pigtails adorned with bows, ribbons or flowers



ping statute in 1932, 204 of the 206 kidnapping cases reported to the FBI had been solved as of Sept. 15, 1941. Bank robbery, which is investigated by the FBI, declined more than 83% since its peak year in 1932. In the fiscal year 1941, convictions were obtained by the FBI in 96% of the cases investigated and brought to trial.

National Defense.—In response to the tremendous increase of its duties because of the national defense program, the FBI doubled its personnel in 1941. A total of 68,368 national defense matters requiring investigative activity were received during the fiscal year 1941. At the request of the army and navy, a program of surveying the protective facilities of industrial plants having contracts to supply the armed forces was instituted in 1939. During the fiscal year 1941, 1,359 plants were surveyed and officials of such plants received from the FBI recommendations designed to afford a maximum of protection against espionage and sabotage. There has been a negligible amount of espionage during the world crisis as compared with the similar period of World War I, and there has been no indication of any organized sabotage in the U.S.A. Through the FBI law enforcement officers mobilization plan for national defense, the activities of federal and local law enforcement agencies have been thoroughly co-ordinated to handle espionage, sabotage and other matters pertaining to the internal security of the U.S.A.

Finger-print Records.—With a nucleus of 810,000 finger-print records, the identification division of the FBI was founded in 1924. In 1941 there were more than 23,000,000 finger-print cards on file. Not all of these prints were those of criminals. The FBI maintains a civil identification section to insure the personal identification of citizens by finger-prints in case of an emergency where identification by other means would be impossible.

More than 14,500 scientific examinations were conducted in the technical laboratory of the FBI during the fiscal year 1941, and many of these examinations were conducted for municipal, county and state law enforcement agencies without charge. (*See* also CRIME; KIDNAPPING; MUNICIPAL GOVERNMENT; POLICE; SECRET SERVICE.) (J. E. H.)

Federal Communications Commission.

The Federal Communications commission was engaged in 1941 in a number of important national defense duties. Besides maintaining surveillance of radio transmissions emanating in the U.S.A., the commission listened in and analyzed broadcasts of foreign origin. The latter task was performed by an adjunct, the foreign broadcast monitoring service, established in 1941. Overseas broadcasts were watched continuously for intelligence and trends. Between 600,000 and 900,000 words were recorded daily. About 75% was in languages other than English.

Meanwhile the national defense operations section of the commission, created in 1940, policed the domestic ether lanes through the medium of nearly 100 field stations of one type or another scattered strategically throughout the United States and its possessions.

Of significance in the broadcast field was the advent of two new services, authorized by the commission on a full-fledged commercial basis. These are frequency modulation, popularly known as "FM," and television. By being on the high frequencies, each offers distinctive features in developing additional broadcast facilities. On March 29, 1941, an orderly shift of domestic standard broadcast frequency assignments was accomplished under the North American Regional Broadcasting agreement. This is a pact between Canada, Cuba, the Dominican Republic, Haiti, Mexico and the United States to eliminate or minimize mutual interference problems.

During 1941 the commission issued regulations to foster competition in network operation. They were subsequently suspended pending court action on requests by two networks for a preliminary injunction. The commission held extended hearings on its investigation to determine what policy or rules, if any, should be promulgated with respect to newspaper applicants to operate FM and new standard broadcast facilities. Hearing was also held on a proposed rule to ban multiple operation of standard broadcast stations in the same area.

The commission effected a reduction in long-distance interstate telephone rates, starting July 10, 1941, which was estimated to save the public $14,000,000 a year. In October the senate interstate commerce committee recommended a merger of both domestic and international United States telegraph carriers which had been proposed by the commission in 1940–41 on the basis of economic and defense considerations. (*See* also DEFENSE COMMUNICATIONS BOARD.)

Federal Council of the Churches of Christ in America.

In 1941 two additional Protestant denominations became official members of the council: The Presbyterian Church in the U.S. (South) by action of its general assembly in May, and the Church of the Brethren by action of its general conference in June. The member denominations of the council include most of the major Protestant bodies and one church (Syrian Orthodox) of the Eastern Catholic group. The total constituency of the council in 1941 was 140,000 local congregations with a combined membership of 25,064,082.

The program of the year was marked by a strong emphasis on the new tasks created by the war. The commission on army and navy chaplains opened an enlarged office in Washington, D.C. The commission on camp and defense communities was created, with the collaboration of the Home Missions council, to assist the churches facing enlarged responsibilities because of their proximity to camps or new wartime industries. A committee on conscientious objectors represented the interest of the co-operating churches in the men rendering their "work of national importance" in civilian camps. A committee on foreign relief appeals, with the collaboration of the Foreign Missions conference, coordinated the efforts in behalf of refugees, prisoners of war, the suffering in China, children in unoccupied France, missionaries cut off from their normal bases of support, and church groups undergoing unusual privation in Europe. A commission on aliens, with special reference to interned aliens in the U.S., was established after the United States entered the war. A commission to study the bases of a just and durable peace was appointed.

The council continued the National Christian mission in a dozen centres of population. Interdenominational conferences on family life, on religion and health, on Christian social work, on inter-racial co-operation and on public worship were held in the different regions of the United States. Ten religious programs over national radio networks were presented each week throughout the year. *Information Service* was published weekly as an analysis of social, international and inter-racial problems of special interest to the churches. (S. McC. C.)

Federal Crop Insurance Corporation: *see* CROP INSURANCE.

Federal Deposit Insurance Corporation.

During 1941, financial aspects of the program for arming the United States and its allies occupied the attention and the re-

sources of insured banks. Bank loans and investments rose by about $6,500,000,000 during the year as banks co-operated in meeting the greatly expanded financing requirements of industry and the government. Insured institutions also gave active support to campaigns of the United States treasury designed to promote the sale of defense bonds and stamps and to encourage savings by their customers in anticipation of the materially increased income tax requirements of 1942.

Immediate effects of the expanded industrial activity of 1941 upon U.S. banks were two. First, the banks—already in a position with respect to soundness and liquidity to undertake the new financing without strain—found their prospects enhanced by increased earnings. Second, many banks whose asset positions had been precarious were strengthened by recoveries in commodity prices and real estate prices. As a result of these influences, only eight insured banks failed during 1941, the lowest number for any year since inception of federal deposit insurance on Jan. 1, 1934.

An expansion of bank loans and investments means the assumption of additional risks. The corporation continually urged, therefore, that insured banks set aside a sizeable portion of their increased earnings to augment bank capital, which through 1941 had not grown at a rate commensurate with the growth of bank assets. It also urged consistently that insured banks carry their assets at proper values, writing off known losses and depreciation as they materialize. These steps are essential if the banks are to be able safely to make the readjustment to postwar conditions.

By the end of 1941, capital and surplus of Federal Deposit Insurance corporation had grown to more than $550,000,000. The corporation's income reached the rate of $55,000,000 a year. Under conditions of 1941, a large part of this income could be added to surplus annually. Given the co-operation of bank management and effective bank supervision, these resources should help to cushion the shock of postwar adjustment.

From the beginning of deposit insurance through Dec. 31, 1941, there were 370 insured banks closed or merged with the aid of loans from the FDIC. These banks held deposits of $470,000,000, of which $458,000,000, or 97%, were made available promptly without loss to depositors. Of the 1,215,000 depositors in these banks, only 1,948, or less than one-quarter of 1%, held accounts in excess of $5,000 and were not fully protected. These 370 cases involved outlays by the corporation totalling $242,000,000, of which it is expected 80% ultimately will be recovered.

There was no legislation during 1941 that altered the status, the functions or the powers of the Federal Deposit Insurance corporation. (*See* also BANKING.) (L. T. C.)

Federal Farm Mortgage Corporation: *see* FARM MORTGAGES.

Federal Home Loan Bank System was created by act of U.S. congress approved July 22, 1932, to provide reserve credit facilities for thrift and home-financing institutions—namely, savings and loan associations, building and loan associations and institutions of similar type. It is supervised by the Federal Home Loan Bank board, composed of five members appointed by the president. The system consists of 12 regional federal home loan banks and their member institutions. The regional banks are in Boston, New York, Pittsburgh, Winston-Salem, Cincinnati, Indianapolis, Chicago, Des Moines, Little Rock, Topeka, Portland and Los Angeles.

Institutions approved for membership are required to invest in the capital stock of their respective regional banks. Of the aggregate stock of the banks, about 73% is held by the government. Beyond their capital stock, the regional banks obtain their funds from the sale of debentures and by accepting deposits from member institutions.

The funds of each bank are used mainly to make advances to members for the purpose of providing additional accommodations to local home owners and investors. Under certain conditions, advances for a short term may be obtained without the deposit of collateral. Long-term advances, which may run up to periods of ten years, must be secured by approved home mortgages or other acceptable collateral.

The bank system has experienced steady and rapid growth. On Jan. 1, 1933, it had but 101 members, with estimated assets of $217,000,000. By June 30, 1941, membership had increased to 3,839, of which 2,346 were state-chartered home-financing institutions, 1,452 federal savings and loan associations, 29 insurance companies and 12 savings banks; their combined assets were approximately $5,300,000,000. On the same date the paid-in capital stock of the bank system amounted to $171,283,200 and the consolidated assets of the banks came to $291,511,973. During 1940, institutions which were members of the bank system made about 40% of the new mortgage loans on urban homes made by all private institutional lenders throughout the United States.

Under the leadership of the regional home loan banks, the member institutions of the system take an active part in the financing of homes for workers in the areas of national defense industries, where such dwellings can be safely financed by private capital. The 3,839 members, with their assets supplemented by the huge credit resources of the system, already have financed thousands of small homes in defense areas during the emergency. Equal effort has been made to stimulate repairs of existing homes and utilization of vacant space to help overcome the acute shortage in crowded industrial centres.

The Federal Home Loan Bank board also administers the Federal Savings and Loan Insurance corporation and the Home Owners' Loan corporation. The latter is also engaged in defense housing activities. (*See* HOME OWNERS' LOAN CORPORATION.)

(J. H. FA.)

Federal Housing Administration. The Federal Housing administration concentrated its efforts in 1941 on aiding national defense and, after declaration of war, the nation's effort for victory. At the same time, new records were established in homes built and in properties improved under the FHA program. Administrator (Jan. 1, 1942): A. H. Ferguson.

Congress amended the National Housing act, under which the FHA operates, by extending title I insurance of property improvement loans through June 1943, and title II insurance of existing-home mortgages through June 1944. There was no time limit on new-home mortgage insurance in the act. Also, congress created title VI, "Defense Housing insurance," to facilitate financing of private construction of defense housing.

Insurance of all types written during 1941 amounted to $1,185,852,709, compared with the previous high record of $1,026,049,609 in 1940, bringing the total amount written from June 1934 through Dec. 1941 to $5,262,117,385. Income for 1941 was more than $26,000,000, of which $13,200,000 went to FHA operating expenses and $12,800,000 to the various insurance funds.

New small homes started in 1941 under FHA inspection totalled 213,777, close to half of all new non-farm homes built, compared with the previous high record of 173,062 started in 1940.

Under section 203 of title II during 1941 the FHA insured 198,799 small-home mortgages for $876,707,384, compared with 168,293 for $736,490,344 in 1940. This amount brought the gross total as of Dec. 31, 1941 to 832,822 mortgages insured for $3,583,060,123. These mortgages are protected by the Mutual Mortgage Insurance fund, which as of Sept. 30, 1941, had net assets of $36,185,411.

Under section 207 of title II (and the repealed section 210), 27 mortgages for $12,997,841 were insured in 1941, financing rental or group housing projects providing 3,001 dwelling units, compared with 48 for $13,017,900 in 1940. As of Dec. 31, 1941, mortgages insured numbered

344 and amounted to $139,950,516, with firm commitments to insure 15 more for $9,369,000. A total of 39,549 dwelling units were provided by the 359 projects. The Housing Insurance fund protecting these mortgages had, as of Sept. 30, net assets of $1,091,055.

Under title VI, 48,617 defense housing mortgages for $180,113,632 were selected for appraisal from April through Dec. 1941; 40,793 for $146,413,340 were accepted for insurance, and 3,778 for $13,431,250 were insured. The Defense Housing fund as of Sept. 30 had net assets of $5,032,093.

Under title I, a total of 687,837 property improvement loans for $282,716,234 was reported for insurance in 1941, compared with 662,948 for $276,541,365 in 1940, bringing the grand total to 3,697,061 loans for $1,525,675,496. These funds were advanced by private financial institutions. The FHA itself lends no money.

The FHA was an officially designated defense agency in 1941. All the homes financed and built under title VI are in defense areas and are primarily for defense workers. About 85% of the new homes financed and built under title II are in important areas of defense activity, as are more than half of the properties improved under title I.

In addition, the FHA acts as an agent of the Office of Production Management (*q.v.*) in processing applications for priority preference in connection with defense housing. This activity is entirely separate from the FHA's insuring functions. (*See* also DEFENSE, NATIONAL [U.S.].)

(A. H. F.)

Federal Land Banks. The 12 federal land banks, which began operation in 1917 under the Federal Farm Loan act of 1916 and subsequent legislation, make long-term first-mortgage loans on farms through 3,600 local co-operative lending institutions known as national farm loan associations. The federal land banks and national farm loan associations also handle the making of land bank commissioner loans. Commissioner loans, made on second as well as first mortgage security, were first authorized in 1933 for emergency financing.

The land banks and local associations after 1933 operated under the supervision of the Farm Credit administration, which also supervises other federally sponsored co-operative lending institutions. Production credit loans in 1941 were made by 530 local co-operative production credit associations, and loans to farmers' co-operatives were made through 13 banks for co-operatives.

Federal land bank loans outstanding on Dec. 31, 1941, amounted to $1,764,398,143, which plus $596,802,174 in commissioner loans represented 34.2% of the total farm mortgage debt of the United States. In 1941 the land banks closed loans amounting to $65,067,729, compared with $64,275,307 in 1940. Commissioner loans made in 1941 aggregated $37,532,699 and $36,663,630 in 1940.

Funds for making land bank loans are obtained primarily from the sale of farm loan bonds to investors. However, repayments on the principal of outstanding loans and other income were sufficient through 1941 to take care of the demands for funds for new loans, and no new public issues of farm loan bonds were necessary. Farm loan bonds aggregating $1,716,233,140 were outstanding on Dec. 31, 1941.

The interest rate paid by farmers with loans through national farm loan associations and by commissioner borrowers in 1941 was 3½%. This rate was provided temporarily by act of congress, and the United States treasury reimburses the banks and Federal Farm Mortgage corporation, which finances commissioner loans, for the difference between the contract rates and the reduced rate. The contract interest rate on most federal land bank loans made during 1941 was 4% and on commissioner loans it was 5%.

The total capital of the 12 federal land banks on Dec. 31, 1941 was $175,071,546, of which 61.4% was owned by national farm loan associations and individual farmers borrowing directly from the banks. The remaining amount was provided by and was owned by the United States government. (*See* also FARMERS' CO-OPERATIVES; FARM MORTGAGES.)

Federal Loan Agency: *see* EXPORT-IMPORT BANK OF WASHINGTON; FEDERAL HOME LOAN BANK SYSTEM; FEDERAL HOUSING ADMINISTRATION; HOME OWNERS' LOAN CORPORATION; RECONSTRUCTION FINANCE CORPORATION.

Federal Reserve System. During 1941 the United States experienced an unprecedented rate of increase in the volume of its bank credit, caused largely by requirements of the federal government and business concerns for funds to finance the defense program. Commercial banks expanded their loans by about $3,000,000,000 and their holdings of United States government securities by about $4,000,000,000, and thus stimulated a further increase in the already abundant supply of bank deposits and currency. During the year, excess reserves of member banks were reduced from about $6,600,000,000 to $3,100,000,000.

The total reserves of member banks, which had been increasing since 1933, turned downward in 1941, the total shrinkage for the year approximating $1,500,000,000. This decline was the result of an accentuated rise in currency in circulation and an increase of treasury deposits at the federal reserve banks, offset only partially by a further increase in monetary gold stock. Because of increased demands for currency resulting from the expanding volume of wages and retail trade, the amount of currency in circulation rose by about $2,400,000,000 in 1941, as compared with about $1,100,000,000 in 1940. Monetary gold stock increased by $740,000,000 in 1941, as compared with $4,300,000,000 in 1940. Net purchases of foreign gold accounted for about $570,000,000 of this increase; there was about $4,200,000,000 in 1940.

On Nov. 1, reserve requirements on demand and time deposits were raised to the maxima permissible under the law, thereby lowering the volume of potential expansion of bank credit. The increase in requirements reduced excess reserves by $1,200,000,000. This reduction and the continued demand for funds on the parts of government and private borrowers caused short-term money rates to advance in the latter part of the year. The greatest advance was on short-term government securities. The yield on taxable treasury notes maturing in three to five years rose from about .625% in September to about 1% in December, as compared with .75% at the beginning of 1941. New issues of treasury bills, which had sold at practically a no-yield basis at the beginning of the year, sold at a yield of about .3% in Dec. 1941.

Except for a slight decrease at the close of the year, there was a rapid expansion of bank loans during 1941. Most of these loans were for the use of commercial and industrial borrowers. Total loans of commercial banks increased from $18,800,000,000 at the close of 1940 to about $22,000,000,000 at the close of 1941. During the same period, such loans at member banks increased from $5,000,000,000 to $6,700,000,000. Surveys indicated that loans to producers and suppliers of defense goods amounted to nearly $1,000,000,000 at the end of 1941.

The holdings of commercial banks in direct and fully guaranteed obligations of the United States government increased by about $4,000,000,000 during 1941, as compared to an increase in 1940 of $1,500,000,000. About 75% of member bank holdings of securities at the end of the year consisted of such obligations.

As a result of the increase in the volume of bank loans and investments supplemented by the continued inflow of gold, total bank deposits, except for interbank deposits, and currency in the hands of the public increased over $7,000,000,000 during the year, reaching a level of about $78,000,000,000 at the end of 1941. The volume of bank debits, represented mostly by checks drawn on deposit accounts, also rose sharply during 1941, reflecting the greater business activity.

Activity in foreign accounts during the year was relatively limited as a result of the "freezing" orders issued from time to time by executive authority which immobilized bank funds held in the United States by foreigners. Except as licensed, all transactions in assets in the United States belonging to nationals of all continental European countries and several far eastern countries were thus frozen. Transactions in such assets were authorized only if they did not conflict with the national interest. For this purpose, a comprehensive licensing system was administered by the treasury department through the federal reserve banks.

As an aid in curbing inflation by restriction of consumer buying power, an executive order on Aug. 9, 1941 empowered the board of governors of the federal reserve system to control instalment buying and other forms of consumer credit (*q.v.*). As a result of the fixing of minimum down payments and maximum maturities in the purchase of durable goods other than residential building, the demand for such materials was reduced.

On Dec. 8 the board of governors announced that the financial and banking structure of the nation was in a strong position to meet any emergency, and the system was prepared to use its powers to assure that an ample supply of funds would be available at all times for financing the war effort. In addition, the federal reserve banks would continue to advance funds on United States government securities at par to all banks.

In accordance with this policy, the Federal Open Market committee purchased government securities in the open market when prices of such securities declined upon the beginning of hostilities. At the end of 1941, government securities held by federal reserve banks totalled $2,254,000,000, as compared with $2,184,000,000 held during the first 11 months of the year. Yields on long-term government bonds, which had declined earlier in the year, increased during December to a level slightly higher than that prevailing at the beginning of the year. Partially tax exempt treasury bonds with maturities of 12 years and over were yielding about 2% at the close of 1941.

The chairman of the board of governors in 1941 was Marriner S. Eccles; vice-chairman, Ronald Ransom. (*See* also BANKING.)

Federal Savings and Loan Insurance Corporation.

The Federal Savings and Loan Insurance corporation is a permanent instrumentality of the U.S. government created by congress in 1934. Its function is to insure the safety of investments, up to $5,000 per investor, in each federal savings and loan association and in each state-chartered institution of the savings and loan type which applies and is approved for this protection.

Standards of eligibility for applicant associations include sound financial condition, competent management, safe lending policies, ability to meet withdrawal demands and satisfactory earning power.

As of June 30, 1941, 2,310 associations with total assets of $3,160,000,000 had become insured, of which 1,455 were federal savings and loan associations and 860 were state-chartered institutions.

These associations were situated throughout the United States and its territories. Practically all were members of the Federal Home Loan Bank system.

Congress provided $100,000,000 paid-in capital of the corporation. Each insured association pays an annual premium based upon its total share and creditor liability. These premiums are used to build substantial reserves for the protection of insured investors, expenses of the corporation being currently paid from interest on invested reserves. On June 30, 1941, the corporation had accumulated reserves amounting to nearly $30,000,000. (*See* also FEDERAL HOUSING ADMINISTRATION; HOME OWNERS' LOAN CORPORATION.) (J. H. FA.)

Federal Union: *see* "UNION NOW."

Federal Works Agency

The Federal Works agency came into existence July 1, 1939, as part of the reorganization plans of that year. Under this new agency of the government were grouped the Public Buildings administration, Public Roads administration, Public Works administration, United States Housing authority and Work Projects administration. The Public Buildings administration was likewise created in 1939 by merging the Public Buildings branch of the treasury (an office of government more than a century old) and the activity of managing public buildings formerly carried on within the department of the interior. The Public Roads administration, formerly the bureau of public roads, was transferred from the department of agriculture. The Public Works administration and the United States Housing authority had been under the supervision of the secretary of the interior. The former Works Progress administration became the Work Projects administration of the new Federal Works agency.

Thus for the first time were unified under one head all the principal construction activities of a civil character in the federal government. John M. Carmody was appointed the first administrator of the Federal Works agency and served until Dec. 1941, when ill-health caused his resignation. He was succeeded by Brigadier General Philip B. Fleming.

As in many other parts of the government, the defense emergency in 1941 made profound changes in the work of the Federal Works agency. Its largest component, the Work Projects administration, managed a diminishing program as millions of workers who had received public assistance returned to private employment, which was expanding under the impact of the defense program. The work relief program, which at the beginning of 1941 had employed 1,890,000 persons, employed only 1,000,000 at the year's end. In the Work Projects administration, as in other parts of the Federal Works agency, emphasis shifted rapidly to programs directly related to the defense emergency, and non-defense activities were curtailed. The Public Works administration was concluding the last of its series of great public works efforts; the United States Housing authority was concluding its initial program of slum clearance and public housing, and the Public Roads administration and Public Buildings administration were winding up large programs in their respective fields.

As these programs declined, new activities were undertaken by the Federal Works agency in the fields of defense housing, defense public works and defense highway construction. To assure homes for defense workers who had migrated to areas where shipping, aircraft, ordnance and other defense products were in the making, congress enacted the Lanham act, Oct. 14, 1940, charging the Federal Works administrator with the responsibility of carrying out a housing program for defense industrial workers and for enlisted men in the army and the navy. By the end of 1941 approximately 50,000 defense homes had been constructed under this authorization and a like number were under way. Through an amendment to the Lanham act in the early summer of 1941, the Federal Works administrator was also empowered to aid in the construction of schools, hospitals, recreation centres, water systems and other community facilities in overcrowded defense areas. Toward the end of 1941 the president approved congressional authorization for the construction of access roads connecting new cantonments and industrial plants with the existing public roads system, and permitting the Public Roads administration to undertake much-needed work to strengthen the nation's highways. In the Work Projects administration many projects of direct value to national defense were undertaken, including the construction or improvement of new roads and airports and a variety of smaller undertakings.

The Federal Works agency in co-operation with the National Resources Planning board likewise undertook to prepare for the day when the emergency would end by creating a Public Work Reserve, a shelf of projects developed in co-operation with local governments that might be undertaken at some future time.

BIBLIOGRAPHY.—Annual reports of the Federal Works agency 1941–42. Current statistical reports of the Federal Works agency and Work Projects administration. (P. B. F.)

Federated Malay States.

One of the three principal subdivisions of British Malaya, the others being the Straits Settlements and the Unfederated Malay States (*qq.v.*). There are four federated states, Perak, Selangor, Negri Sembilan and Pahang, of which the first three are on the west coast of the Malay peninsula, while Pahang is on the east coast. Area, 27,540 sq.mi.; pop. (1940) 2,169,313. Individual population figures in 1940 were as follows: Perak, 973,638; Selangor, 688,185; Negri Sembilan, 290,369; Pahang, 217,121. The entire population was racially classified as follows: Chinese, 967,255; Malays, 703,939; Indians, 464,813; Europeans, 10,722; Eurasians, 5,168; others, 17,416.

Each state is administered under the advice of a resident, who is subject to the instructions of the high commissioner, an office which is combined with that of governor of the Straits Settlements. High commissioner in 1941 (appointed in 1934): Sir Thomas Shenton Whitelegge Thomas. The seat of the federal government is at Kuala Lumpur (Selangor), the largest town in the states, with a population (1940) of 138,425. The Japanese had occupied large sections of Malaya by 1942. (*See* WORLD WAR II.)

Education.—Expenditure on education in 1939 was £414,102. There were 48 English schools with 19,138 pupils, 576 Malay schools with 62,-

363 pupils, 523 Chinese schools with 49,614 pupils and 556 Indian schools with 24,246 pupils.

Finance.—Revenue in 1939 was £8,198,888 sterling and expenditure £9,006,473. The debt was £7,616,667.

Communication.—At the end of 1939 there were 3,108 mi. of metalled and 198 mi. of unmetalled roads in the states, with 1,565 mi. of bridle paths.

Agriculture and Mineral Production.—Rubber is an important product of the Federated Malay states, and the area under rubber plantations in 1939 was 1,668,719 acres. In the same year the states produced 51,090 tons of tin, 441,025 tons of coal and 40,283 oz. of gold; 72,954 labourers were engaged in mining. Most of these miners are Chinese, who stand the underground work better than the Malays, who are generally engaged in agriculture, hunting and fishing. Indians are largely employed in the rubber plantations. Coco-nuts, rice, oil-palms, pineapples, tea and timber are subsidiary products of the states. (W. H. Ch.)

Federation of Labor, American: *see* American Federation of Labor.

Feldspar. World production of feldspar is of the order of 400,000 to 450,000 metric tons, of which the United States supplies nearly two-thirds, followed by Sweden, China and Norway, with a number of minor producers. Production of crude feldspar in the United States in 1940 increased to 290,763 long tons, and consumption of ground feldspar to 285,713 short tons, nearly 4% of which was produced from Canadian crude. (G. A. Ro.)

Fencing. With many well-known names in the title events of the national competition conducted by the Amateur Fencers League of America, only one 1940 champion was able to overcome the superior technique of the new crop of contenders, that being Norman C. Armitage of the Fencers club (N.Y.) who again fought his way to victory in the national sabre event. Other national champions for 1941 were Dean Cetrulo, of Salle Santelli, in the foil event, and Capt. Gustave Heiss, of U.S. Army and Fencers club, the winner of the épée title. Miguel A. de Capriles, of Salle Santelli, accounted for the three-weapon championship.

National team honours changed hands, too, as the quartette of the New York Athletic club took the foil team title; the Fencers club (N.Y.) four bested all others in the épée team contest; fencers of Salle Santelli (N.Y.) captured the sabre team championship and also led in the three-weapon team contest. In the two national women's events, Miss Helene Mayer, the Olympic fencer, representing the San Francisco Fencers club, captured the foil championship, and the team of the Fencers club accounted for the foil team title.

The inter-divisional championships, covering the eastern, midwest and Pacific coast sections of the U.S., also showed an improvement in the quality of fencing.

In the all-eastern championships, Miguel A. de Capriles took the outdoor sabre title; Dean Cetrulo, the foil events; Arthur Tauber, épée; Douglas Gerard, sabre; and Miss Dorothy Lancaster, women's foil title. N.Y.A.C. fencers took the foil and épée team titles, and Salle Santelli fencers captured the sabre and women's foil championships. The midwest and Pacific coast championships were well contested.

Intercollegiate Fencing.—New York university fencers retained their three-weapon crown and foil team title and also added the épée team event. Harvard and City college tied for first in the sabre event. Arthur Tauber of N.Y.U. again won his épée honours, Charles Steinhardt of St. Johns, gained first in the foil and G. P. Stokes of U.S. navy won the sabre. (J. B. P.)

Fertilizers. The war throughout the world almost completely dislocated world trade in fertilizer raw materials. Even were these materials available, scarcity of ships and war blockades would prevent their transportation to other countries in normal quantities. Chile continued to export nitrate of soda in reasonable amounts to Great Britain and the United States when ships were available. With war in the Pacific as well as in the Atlantic (Dec. 1941), shipments might be curtailed temporarily.

Each belligerent nation expanded its capacity for the fixation of atmospheric nitrogen. In the United States, for instance, the synthetic nitrogen fixation plants under construction and entering production were expected to have a capacity much greater than any peacetime consumption of nitrogen compounds in industry and agriculture. In addition, construction of other fixation plants was authorized and in some cases started. A similar condition no doubt existed in most of the other industrial countries at war.

Increased production of steel required more coke. This resulted in greater production of by-product sulphate of ammonia. Increased production of lard and vegetable oils resulted in greater production of animal tankage and vegetable meals. All these provided additional supplies of nitrogen-bearing fertilizer materials useful in carrying out national programs for increased food production.

Phosphate rock deposits known to be of great extent are confined to the U.S.S.R., North Africa and the United States. War activities in the Mediterranean interfered greatly with African operations. South America and the British empire were being supplied by the United States. The U.S.S.R. and the United States are self-sufficient. For the duration of the war the rest of the world was expected to face a shortage of phosphates.

Potash was being produced in the United States in sufficient quantity for the requirements of the western hemisphere. Spain was beginning to produce again; the U.S.S.R. could satisfy its own needs; but the known deposits of the rest of the world were in Germany or in territories occupied by Germany. It seemed probable that production of potash in the United States would be increased sufficiently to fill at least part of the needs of the British empire.

There were expected to be serious domestic and international dislocations of commerce in fertilizer materials because of transportation difficulties and perhaps because of man-power shortage. War priorities and allocations resulted in supplying munition needs first and other war and civilian needs later. But fertilizers are essential to achieve the agricultural production goals demanded by war and must therefore receive preferential consideration. Statistics were of little value. Authentic figures were suppressed as military secrets. (C. J. Br.)

Finger, Charles Joseph (1869–1941), U.S. author, was born Dec. 25 in Willesden, England. He attended private schools in England and studied music in Germany, then shipped as a deckhand to Patagonia in search of adventure. In succeeding years he visited Mexico, Africa and the Klondike. He interspersed his travels with a three-year stay in a Texas town, where he headed a music conservatory, and from 1906 to 1920 he managed a group of railroads in Ohio. It was not until he had reached the age of 52 that Finger emerged as a successful writer with publication in 1921 of his first book, *Choice of the Crowd.* In 1925 his *Tales from Silver Lands* won the Newbery medal of the American Library association for the most distinguished contribution to juvenile literature. In 1929 he won the Longmans, Green & Company contest prize for juvenile fiction with *Courageous Companions.* In 1930 his autobiography, *Seven Horizons,* won acclaim as a work of literary distinction. Other works were: *Golden Tales from Far and Near* (1939); *Cape Horn Snorter* (1939); and *Fighting for Fur* (1940). He died Jan. 7 at Fayetteville, Ark.

Finland. An independent republic of northern Europe. Area, 134,000 sq.mi. (land area, 121,000 sq.mi.), after cession of 13,500 sq.mi. to the U.S.S.R. in 1940. The population of about 3,800,000 was not materially reduced by the cession of territory, because most of the 450,000 people affected moved into other parts of Finland. Capital, Helsinki; pop. (est. Jan. 1, 1939), 304,965. Other principal cities are Turku (74,315) and Tampere (76,730). Viipuri (74,247) was ceded to the U.S.S.R. in 1940 and was recaptured in 1941. Langauge and nationality, 90% Finnish, about 10% Swedish. Religion, Lutheran Christian. President in 1941, Risto Ryti.

History.—Finland was beaten into a bitter desperation by the soviet invasion of 1939–40 and the treaty it was forced to sign on March 12, 1940. By this treaty it had lost its famous border city of Viipuri and extensive territory; some 500,000 people were left homeless; and the flower of its youth had been slaughtered or maimed. With the German attack on Norway in April 1940, the general war closed in more tightly around Finland. The work of reconstruction was made more difficult by the cutting of trade routes—Finland could neither sell its goods nor buy necessities. Sweden had given lavishly to aid Finland in the war, but Swedes could not supply Finns with food or the commerce needed for rebuilding. In 1940 Germany alone seemed both able and willing to be of real aid to Finland, and Germany had been friendly in times past—as in 1918, when the Finns had also been fighting against the age-old enemy to the east.

When, in the summer of 1940, Germany asked for permission to send troops through Finland to Norway, most Finns were glad to see them—perhaps their presence would give warning to the Russians not to make a second attack. During the winter and spring of 1941 some German soldiers began to camp in Finland, but few people worried, except the Russians, who reported on April 26 that 12,000 German troops had landed at Turku. The British public thought that the Russians were just parading a ghost for some purpose known only to themselves. Meantime a carefully suppressed controversy on neutrality was agitating Swedish-Finnish diplomacy. Forebodings of trouble accumulated. The British government sent a note to Helsinki announcing that no "navicerts" for ships to Petsamo would be issued after June 14, 1941, because they regarded Finland no longer "free." The British navy intercepted and detained three Finnish ships. On June 18 came rumours of a Russian exodus from Hangö, their leased base in southwestern Finland. The same day word leaked out that Finnish soldiers and "Lottas" were crowding the streets of Helsinki. On June 20 the Finns reported Russian military movements in Lithuania and declared general mobilization. Two days later the Germans struck at the U.S.S.R. in the south, and on June 27 President Risto Ryti announced that the Russians had again attacked Finland, and that "for the liberty of the fatherland" Finland was going to war alongside Germany and "their genial leader, Reichschancellor Adolf Hitler." For the third time in 23 years Baron Mannerheim led his troops against the Russians. On Aug. 30 the Finns could proclaim the recapture of Viipuri (Viborg), though in sadly devastated condition. Long thrusts into soviet territory were made all along the frontier, but the fortifications of Leningrad could not be pierced. (*See* WORLD WAR II.)

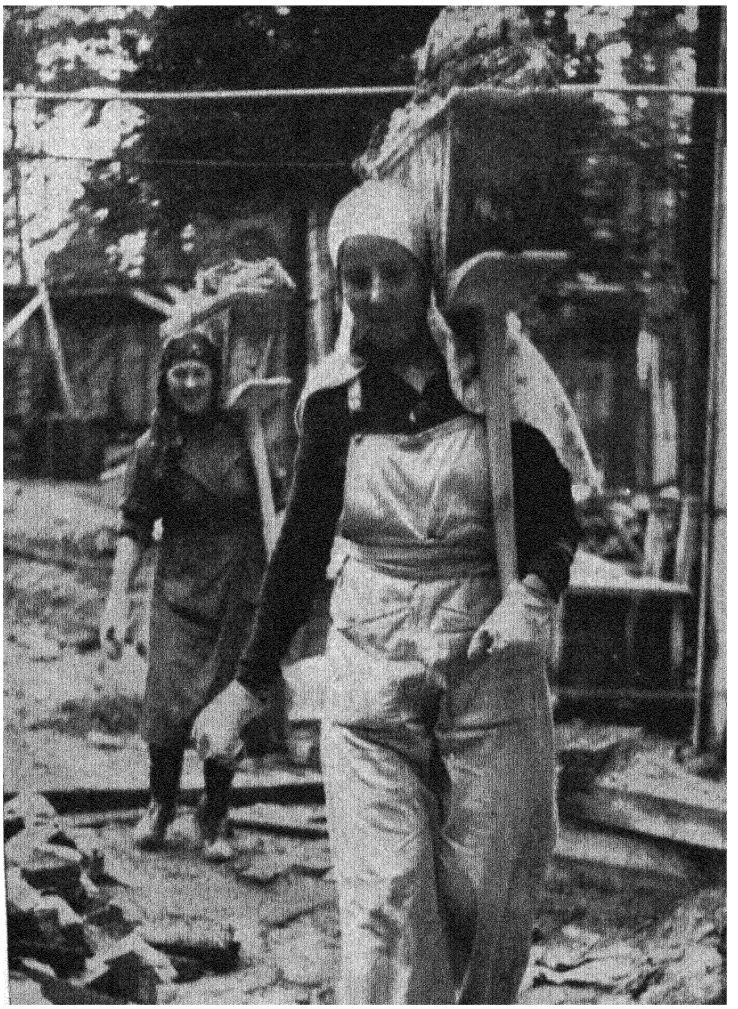
After Sept. 1941 reports recurred that Finland was about to make a separate peace, and individual Finns declared that their country wanted only the old boundary and would stop fighting when that was reached. Official denials were made repeatedly. Through Washington channels the U.S.S.R. in mid-August was reported willing to discuss peace with Finland (denied in Moscow). Whether by independent decision or through pressure from Berlin, the Finnish government clung to its policy; on Nov. 25 Finland signed the anti-Comintern pact with the axis countries; on Nov. 29 Premier J. W. Rangell won a unanimous vote of confidence from the parliament. But by this time Russian appeals and their own interests had brought the British to the point of a declaration of war on Finland (Dec. 6). U.S. Secretary of State Hull had warned Finland early in November that it must cease fighting the soviet state or lose U.S. friendship. After the British declaration of war, the United States government took into custody six Finnish vessels in its ports.

Finland had agreed in May to a plan for making up the debt payments to the United States, suspended in 1939 and 1940. Within the country two reconstruction loans, for 1,000,000,000 marks ($20,000,000) each, were subscribed before the middle of August. Building and clearing were proceeding on the assumption that within 20 years arable land could be doubled, and before that time Finland could be producing beyond its own needs. Compensation for war losses was being paid by the state to individuals up to amounts of 2,000,000 marks ($40,000). But problems were staggering even before the renewed war with Russia. The wholesale price index, based on 1935=100, had risen to 164; food prices were up nearly 60%, machinery 40%. From Jan. 1940 to June 1941 industrial production for export sank to 55%, and foreign trade to 40%. Agriculture yielded poorly and lard had been curtailed. Sugar, coffee, etc., were rationed strictly. Thus marched Finland into war in June 1941.

Education.—In 1939 there were some 11,200 elementary schools, with 411,000 students and 13,500 teachers; there were 383 professional schools in 1937 with 20,583 students, 68 middle schools with 8,546 students, and 150 lyceums with 42,034 students. There were five universities, of which that at Helsinki was the largest (enrolment, 6,461 in 1938).

Finance.—The monetary unit is the Finnish markka (=2 U.S. cents approximately; at the last free quotation in 1939, 49 FM=$1). Budget (est. 1939): revenues, 5,534,700,000 FM; expenditures, 5,432,800,000 FM;

BETWEEN TWO WARS, Finnish women in 1941 did the work of men in rebuilding their nation's bomb-torn cities



foreign debt (Sept. 1939), 1,040,000,000 FM; internal debt (Sept. 1939), 2,810,000,000 FM; note circulation (April 1, 1941), 5,720,000,000 FM.

Defense.—Service in the army is compulsory for men between the ages of 17 and 60. Effectives in 1938 numbered 2,012 officers, 31,000 men; in 1941, reports varied between six and nine divisions (90,000–135,000 men). The navy in 1939 included two coast defense vessels of 4,000 tons each, four gunboats, seven motor-torpedo boats, three mine layers and five submarines. In 1939 there were three air regiments of three squadrons each. The women's Lotta Swärd organization was exceptionally active, and the 100,000 civic guards were an integral part of the military machine in 1941.

Trade.—Exports (1938) totalled 8,431,111,000 FM; (1940) 2,870,000,000 FM; imports (1938), 8,612,283,000 FM; (1940) 5,180,000,000 FM. Major export commodities, with their values in 1940, were as follows: pulp, paper, etc., 950,000,000 FM; timber and wood, 1,200,000,000 FM; foods of animal origin, 70,000,000 FM; metals and metal goods, 200,000,000 FM; hides, skins, etc., 90,000,000 FM; minerals, 80,000,000 FM. Major import commodities with values in 1938: metal and metal goods, 1,420,500,000 FM; machinery and apparatus, 1,120,300,000 FM; minerals, 661,100,000 FM; colonial products, 585,500,000 FM; oils, fats, waxes, 503,300,000 FM; transportation equipment 482,900,000 FM. Great Britain, Germany and the United States were the leading importers of Finnish products, while the same three countries plus Sweden supplied most of Finland's imports.

In the first quarter of 1941 imports of civil goods totalled 1,348,000,000 FM; exports, 552,000,000 FM. Particularly exports were thus still far below normal, a fact which was accentuated by adjusting figures to prices much higher than in previous years. (Index figure 164 against 100 in 1935.)

Communication.—Railways (1938) totalled 3,530 mi. and carried 21,200,000 passengers and 15,710,000 tons of freight in 1937. Buses in operation numbered 2,500 in 1937; 20,300 mi. of main highways were maintained by the state. In 1938 there were 185,456 telephones in operation, 1,593 mi. of telegraph lines, 18 broadcasting stations and 293,790 radio sets.

Agriculture.—The chief crops in 1939, with their yields in short tons, were as follows: oats, 879,635; wheat, 250,222; barley, 211,642; rye, 364,861; potatoes, 1,715,179. Livestock in 1937: 380,038 horses; 1,925,078 cattle; 1,072,307 sheep; 10,372 goats; 504,164 pigs; 100,356 reindeer; 2,814,960 poultry; 18,374 beehives.

Manufacturing.—In 1937 there were 4,246 establishments which employed 207,506 workers and produced goods valued at 21,076,045,000 FM. The chief products and their values were as follows: wood and paper, 9,428,919,000 FM; food and luxuries, 3,453,956,000 FM; textiles, 2,264,267,000 FM; machinery, 2,113,012,000 FM; metal, 1,767,424,000 FM; leather and rubber, 946,071,000 FM.

Mineral Production.—Following are the chief mineral products of Finland and their output in 1938: pyrite ores (113,514 tons); pyrites (sulphur content) (48,811 tons); copper ore (15,542 tons); copper (13,483 tons); gold (3,858 oz.); and silver (57,900 oz.). (F. D. S.)

Fire Insurance: *see* INSURANCE, FIRE.

Fires and Fire Losses.

For the year 1941 the fire loss in the United States amounted to about $322,357,000. These statistics were furnished by the National Board of Fire Underwriters, the recognized authority for this form of information. The losses by fire were 5% greater than in 1940 and were the largest since the year 1932, when the figure was $442,000,000. Beginning with 1933, the losses dropped sharply, but during 1940 and 1941 there was a steady increase. For each month of the year 1941 the fire loss was approximately $25,000,000; in only four months did it fall slightly below that amount. In March it rose to $31,000,000 and that also was the figure reached in December.

The substantial increase in 1941 over the previous year was largely due to one fire. There always is some one outstanding event in the fire loss picture, and the Fall River, Mass., fire was the one in 1941. On Oct. 12 occurred that serious fire, with an estimated loss of $15,000,000, due to the destruction in part of the factory and warehouse used in the making of rubber products and the storage of the rubber necessary therefor. The increase of $16,000,000 in fire loss over the year 1940 was almost entirely accounted for by this one extraordinary fire.

The increasing activity since 1939 accounted for the increasing fire loss during that period. The pressure under which plants were being operated would, even under very normal conditions, produce a larger number of fires than when operations proceeded at a more modest rate. The question of sabotage was raised, but the records did not show any effect on the fire loss because of such activities. (E. R. H.)

Great Britain.—Certain steadying influences were at work in fire insurance during 1941. The shock to the business caused by the war had been duly absorbed, and fire insurers had been able to adjust their business to new conditions. The premiums received during 1940, as shown in the accounts published during 1941, in almost all cases showed a slight increase over 1939, averaging about 5%. This was a result of the strong position established in past years by British fire offices throughout the empire and on the American continents, and it was achieved in spite of the loss of business due to the closing of European branches and agencies in the countries overrun by the enemy during 1940. The process was further assisted by some adjustments in the distribution of fire reinsurance business, so that a considerable volume formerly placed with European reinsurers returned to Great Britain and was digested by the home market. An important volume of business also was handled by British insurers through the government commodity insurance scheme, under which certain staple commodities taken over or controlled by the government and situated in various parts of the world are insured with the British market against fire and special perils. First made during 1940, this arrangement returned to normal insurance channels a large block of business which had been withdrawn after the outbreak of war. It proved its worth during 1941 and was extended with advantage to the interests concerned.

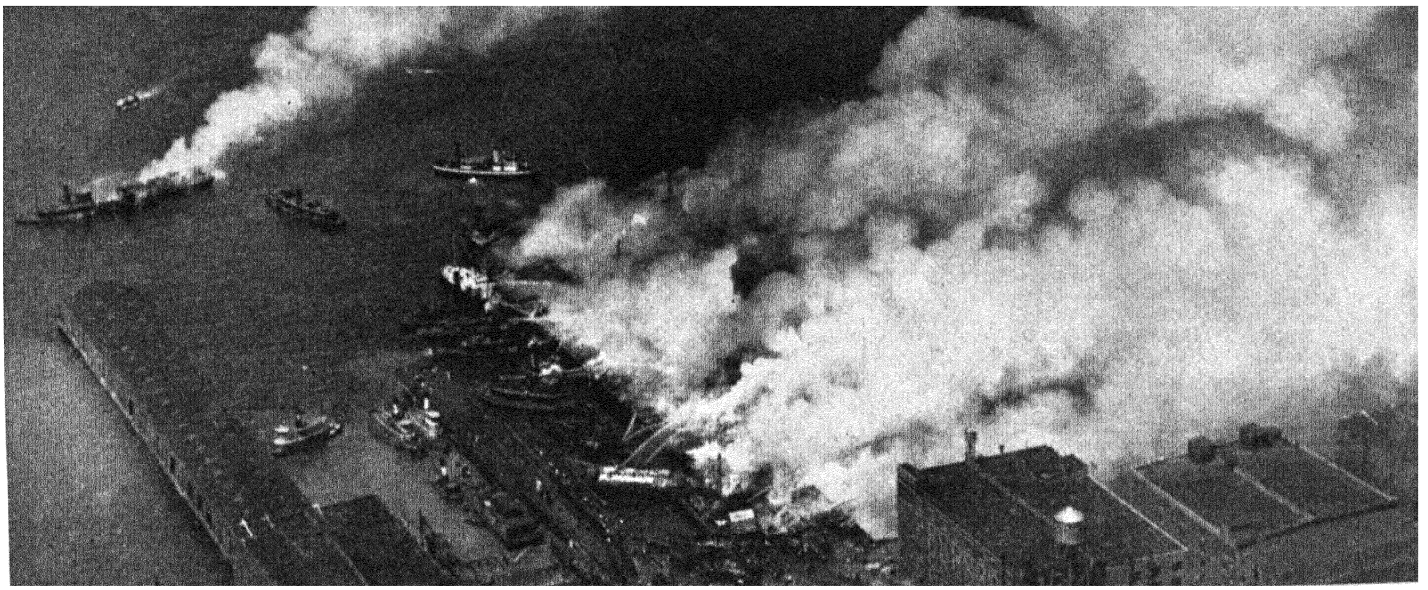
Upon the passing of the War Damage act, 1941, fire insurers were appointed agents of the board of trade to carry out the business and private chattels schemes as provided in that act. The understanding is that those desiring coverage under either of these schemes should apply to the insurer carrying the relative fire insurance.

When the full loss experience of 1940 became available, that year showed a most costly result, the figures in the home field being the highest for some 20 years past. The total home losses as estimated in the monthly returns amounted to £12,640,400 in 1940, compared with £9,088,000 in 1939 and £8,780,800 in 1938. The corresponding figures for 1941 showed a considerable improvement. The estimated home fire losses for the period of nine months to the end of Sept. 1941 appeared at £7,391,000 as against £9,337,000 for the same period of 1940.

Europe's figures come much more slowly to hand, but there was in 1941 one serious conflagration at Santander in Spain. Nothing could be done in 1941 to liquidate outstanding loss liabilities in the overrun countries of Europe and this matter could only be suspended until after the war. Further progress, however, was made towards settling claims arising out of the Spanish Civil War, and so far as riot losses were concerned arrangements were made for the payment of two-thirds of the claims, the remaining one-third to be carried forward. Fire claims arising out of the civil war were being dealt with by a national syndicate. (*See* also DISASTERS; INSURANCE, FIRE.) (C. E. G.)

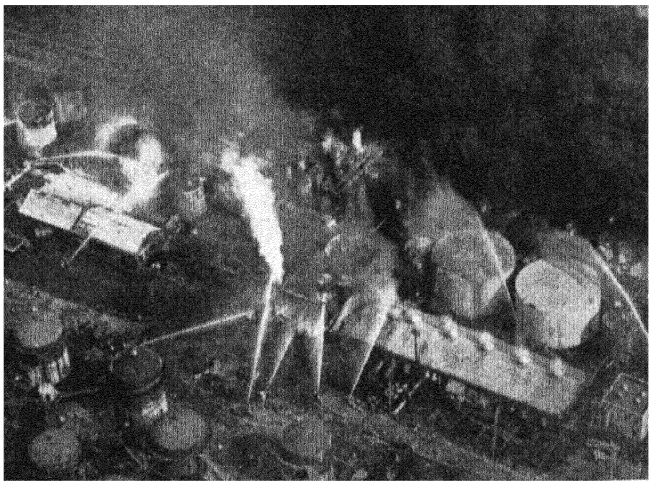
Fish and Wild Life Service.

Of foremost importance in all the service's activities in 1941 were its efforts to contribute in every possible way to national defense. At the same time, however, steps were taken to prevent unnecessary damage to the fish and other wild life resources during the emergency. At President Roosevelt's request, an official of the service was appointed by the secretary of the interior as a liaison officer to keep informed of defense activities that affect fish or other wild life. Not only was the liaison beneficial in connection with emergency activities, but it was also probable that improved standard practices and policies would be developed. Co-operation in national defense included emphasis on the food value of fishes, on predator and rodent control, and on the intangible but highly beneficial contributions to individual and national morale that result from recreation in areas where wild life is abundant.



Above: A FIRE ORIGINATING IN CARGO unloaded from the freighter "Panuco" spread rapidly through a large Brooklyn pier Aug. 18, 1941 and killed more than 30 longshoremen and sailors

Above: DEFENSE STORES valued at $25,000,000 were destroyed May 31, 1941 in a fire which swept through a large area of the Hudson river waterfront at Jersey City, New Jersey



Above: A FIRE which started in the naphtha treating plant of a huge refinery at Whiting, Ind. Sept. 24, 1941 spread rapidly to other buildings and tanks before it was brought under control

DROPPED F[illegible] 10,000 fingerling brook and rainbow trout were stocked in Redfish lake, Idaho in the summer of 1941 with a loss of only one per cent. The lake is in an almost inaccessible part of the Sawtooth mountains, near Sun Valley

During the first year of its existence, the fish and wild life service (which was established on June 30, 1940, by consolidation of the bureau of biological survey and the bureau of fisheries) was also concerned with administrative and organizational adjustments and improvements. Entering the year 1941 as a new agency, the service had to carry on and coordinate the activities of two formerly separate bureaus. No drastic changes were made. A consolidated administrative division was established and public-relations work was centralized in one division, but the operating units were continued with few readjustments. Activities were coordinated, however, in so many instances that the advantages of the consolidated service were being constantly realized.

Under Dr. Ira N. Gabrielson, director, the service included divisions of wild life research, fishery biology, federal aid in wild life restoration, land acquisition, wild life refuges, construction and Civilian Conservation corps operations, game management, fishery industries, fish culture, Alaska fisheries, and predator and rodent control. W. C. Henderson and Charles E. Jackson were assistant directors. Regional field headquarters are in Portland, Ore.; Albuquerque, N.Mex.; Minneapolis, Minn.; Atlanta, Ga.; Boston, Mass.; and Juneau, Alaska.

The food value of the commercial fishes is indicated by a survey showing that in 1939 the fishermen of the United States and Alaska took 4,443,328,000 lb. of fishery products valued at $96,532,000 to the fishermen. So important is this source of food regarded that members of the service were appointed to committees of the National Defense Advisory commission and of the Office of the Administrator of Export Control. They also contributed extensively in furnishing inventories of fishery commodities, assisting in drawing specifications for fishery products, and supplying information useful to military purchasing agencies and federal food-planning organizations. Estimates of the possibilities for increasing this food supply led to the conclusion that a 46% increase could be realized over a period of years and that under conditions of wartime emergency the yield could be increased to 4,628,000,000 lb. almost immediately and to 6,200,000,000 lb. after a few years.

Protection was afforded livestock, poultry and game during the year by the taking of 122,941 predatory animals in co-operative control work, thus providing additional safeguards to wool and meat supplies. Cultivated crops, timber and forage resources, irrigation and soil-conserving structures, and stored food and feed supplies were protected from rodent damage through the treatment, under the service's supervision, or general direction, of 25,321,902 ac. of rodent-infested lands and 104,267 rat-infested premises. An acute shortage of high-grade red squill, an important raticide, resulted when the U.S. was cut off from the source of supply in the Mediterranean, and to meet this problem scientists of the service developed a method for the practical fortification of low-grade squill. In co-operation with the bureau of plant industry of the department of agriculture, steps were also taken to determine whether squill might be satisfactorily grown in the United States.

Other activities of the year were in the main continuations of programs already under way. Estimates compiled indicated that the big-game population of the United States in 1939 was more than 5,800,000. The annual waterfowl inventory in Jan. 1941 resulted in an estimate of more than 70,000,000 ducks and geese, representing the sixth consecutive annual increase as a result of the restoration program. Compilations of state reports indicated that in the 1939–40 seasons more than 7,600,000 persons paid a total of almost $13,000,000 for hunting licenses. Sales of the federal stamp required of all over 16 who hunt migratory waterfowl continued to increase, a total of 1,257,313 stamps having been sold in the 1940–41 year. Output of fish and eggs at the 116 federal hatcheries during the year ended June 30, 1941, approximated 6,020,000,000, a drop from the previous year's 7,400,000,000 attributed mainly to curtailment of cod, haddock and pollock production.

The program for aiding the states in wild life restoration increased. In all, 265 projects, involving $2,964,648, were begun by the states in this program, which provides for federal payment of 75% of the cost of projects carried on by the states with federal approval. (*See* also FISHERIES.)

BIBLIOGRAPHY.—Dr. Ira N. Gabrielson, *Wildlife Conservation* (1941). Official publications included the following: Administrative Reports 40 and 41, *Alaska Fishery and Fur-Seal Industries, 1939* and *Fishery Industries of the United States, 1939;* Fishery Bulletin 35, *Studies on the Striped Bass of the Atlantic Coast;* Research Report I, *Studies on the Handling of Fresh Mackerel;* Wild Life Research Bulletins 2 and 4, *Food Habits of the American Coot with Notes on Distribution* and *Food Habits of the Coyote;* Wild Life Circulars 6 and 11, *The House Rat* and *Wildlife of Atlantic Coast Salt Marshes;* and Conservation Bulletin 7, *Plants Useful in Upland Wildlife Management.* (H. Z.)

Wild Life Conservation.—The "Convention on Nature Protection and Wild Life Preservation in the Western Hemisphere" which was approved and recommended for signature by the governing board of the Pan American union, as a result of the sessions of the Eighth American Scientific congress held in Washington, May 10 to 18, 1940, was expected to come into force early in 1942. The convention provides for international agreements and co-operation "to protect and preserve in their natural habitat representatives of all species and genera of their native flora and fauna, including migratory birds, in sufficient numbers and over areas extensive enough to assure them from becoming extinct through any agency within man's control" and "to protect and preserve scenery of extraordinary beauty, unusual and striking geologic formations, regions and natural objects of aesthetic, historic or scientific value, and areas characterized by primitive conditions." Under its terms the convention would come into force three months after the deposit of not less than five ratifications with the Pan American union. Latin-American signatories representing 17 countries and the United States were already on file, and the ratifications of four—Guatemala, Salvador, Venezuela and the United States—had been deposited with the Pan American union at the close of the year. The Dominican Republic ratified the convention, but its ratification had not been deposited with the Pan American union up to the close of 1941.

Cuba was one of the early signatories and afforded a striking example of the beneficial results that might be derived from the convention as a motivating influence. A proclamation by the president of Cuba established lists of species of wild life to be entered for Cuba in the annex of the convention. Twenty-five species of migratory birds, including the jabiru stork and the roseate spoonbill, were to be given permanent protection. Such protection was also extended to three native species of quail doves, the Cuban parrot and the Cuban parakeet. Cuban mammals placed on a permanent protection list were the manatee and three species of rodents, all hutias of the genera *Capromys* and *Geocapromys*. The establishment of four national wild life refuges and a national park was also proclaimed. A refuge for flamingos included the northern and southern coasts of the provinces of Santa Clara and Camaguay. Wild life refuges and national parks were also established in other Latin-American countries.

Federal Aid to States.—Notable progress was made during the year in carrying out the provisions of the Federal Aid to Wild Life Restoration act (50 Stat. 917), known also as the Pittman-Robertson act, which became effective on July 1, 1938. Under the act, federal aid to wild life was extended through large scale co-operation with the states. The act authorized operating appropriations of not to exceed the annual revenue from the 10% tax on sporting arms and ammunition. Wild life restoration projects were outlined, and if approved, the participating state paid 25% and the federal government 75% of the cost. To carry on the work for the fiscal year 1942, the sum of $2,750,000 was appropriated by congress.

Federal aid restoration projects were being carried out on 2,254,355 ac. in Texas. New Mexico and Texas trapped and moved 1,046 antelope to suitable but unpopulated habitats. Wisconsin and the fish and wild life service co-operatively were acquiring the Horicon marsh of 31,500 ac., long known as an area especially favoured by waterfowl. At the end of the year there were 342 active projects in 46 states, Alaska, Puerto Rico and the Virgin Islands.

Bird Refuges.—There were (Jan. 1, 1942) 267 refuges—an increase of four—for all forms of wild life, administered by the fish and wild life service, department of the interior, aggregating 13,740,304 ac. Of these, 251 (9,646,072 ac.) were in the United States and 16 (4,094,232 ac.) were in Alaska, Hawaii and Puerto Rico. Of the total, 253 (7,098,166 ac.) were primarily for birds and 14 (6,642,138 ac.) were mainly for big game, but wild life in general was accorded protection on all refuges. Of the four new refuges established by executive orders during the year 1941, three were expressly for birds and one primarily for big game. Two of these—the Havasu Lake refuge and the Imperial refuge, containing 47,841 ac.—were water storage projects of the bureau of reclamation on the Colorado river between California and Arizona. Their principal wild life use was as wintering and resting grounds for migratory waterfowl, especially ducks, in an arid region where water areas were few and far between. The Thief Valley refuge (1,495 ac.) in Baker and Union counties, Oregon, another reclamation project, was also made available as a waterfowl wintering area. The San Andres refuge, Dona Ana county, New Mexico, containing 57,215 ac., was set aside primarily for desert bighorn sheep of a type threatened with extinction. Antelopes and mule deer would also receive needed protection.

The response of refuge areas to stabilized water levels, planting of marsh and aquatic vegetation, range revegetation, reforestation, controlled grazing and protection from fire was spectacular. Areas which in 1937 presented desolate pictures of the effects of unwise drainage, drought, overgrazing and general land abuse presented in 1941 entirely different aspects

owing to remedial measures. Dry lake beds and drained marshes again supported luxurious stands of vegetation and attendant wild life populations. Overgrazed and eroded uplands were rapidly becoming covered with protective vegetation, furnishing food and cover for wild life where only barren soil or noxious weeds were present before. More waterfowl were produced on the nesting refuges during 1941 than ever before since their establishment. Large increases also were noted in the number of birds spending the winter on many of the refuges or stopping to rest and feed during migration periods; and on a number of refuges where the development of waterfowl habitat had been completed, fur animals increased to a point where large-scale removals became necessary. Upland game birds also showed decided increases on many of the refuges.

Evidence that wild life populations increased as a result of habitat improvement was the necessity of removing surpluses in order to keep resident species within the bounds of the available food supply. Some refuges were subject to joint use by waterfowl, or upland game birds, and big game animals; and on others the limited grazing by domestic stock was permitted in accordance with a broad policy providing for the most advantageous land use. During the year, deer were removed from the Aransas refuge, Tex., Blackbeard Island refuge, Ga., Cape Romain refuge, S.C., and National Bison range, Mont., for restocking state and federal lands. Wild turkeys, elk, and antelopes also were removed from several refuges, and more than 8,000 ring-necked pheasants were taken from the Sand Lake refuge, S.Dak., and 400 from the Camas refuge, Ida., for the same purpose. About $92,500 was realized from the sale of surplus big game and fur animals and other refuge products and privileges. In accordance with the law, 25% of this was turned over to the counties in which the refuges are situated and the remainder deposited in the federal treasury.

More than $1,257,000 were made available during the fiscal year ending June 30, 1941, for the continuance of the migratory waterfowl restoration program through the sale of migratory bird hunting stamps as provided for under the Migratory Bird Hunting Stamp act (49 Stat. 379). Ninety per cent of these funds were used for acquiring, developing and administering refuges for migratory waterfowl, and 10% for the enforcement of laws for the protection of migratory birds and the expenses of the post office department in engraving, issuing and accounting for the stamps.

(E. A. G.)

Fisher, Clarence Stanley (1876–1941), U.S. archaeologist, was born Aug. 17 in Philadelphia, Pa. After graduating from the University of Pennsylvania in 1897, he was sent by the university's museum directors on an archaeological expedition to Nippur, Mesopotamia; the results of his findings were published in a six-volume report. He later made expeditions to the near east for Harvard university and the Boston Museum of Fine Arts. In 1926 he accepted a professorship in archaeology at the American School of Oriental Research in Jerusalem, later becoming acting director. Among his outstanding achievements were the discovery in 1920 of the gravestones of Seti I and Rameses II, and the excavation at Memphis of the Palace of Merneptah. Dr. Fisher died in Jerusalem, July 20.

Fisher, Frederic John (1878–1941), U.S. manufacturer of motor car bodies, was born Jan. 2 in Sandusky, O., the eldest of seven brothers. He learned the trade of wheelwrighting and smithing at his father's smithy and in 1902 he went to Detroit to work in a carriage plant. In five years he became manager of the plant. His success lured the other six brothers to Detroit, and the Fisher brothers organized in 1908 the Fisher Body company with their uncle as president. Subsequently the brothers bought out the uncle's interest for $50,000, and under Frederic Fisher's enterprising management, the company's expansion paralleled the enormous development of the motor industry. In 1923 the General Motors corporation bought the company for $208,000,000, retaining all the brothers in executive positions in the corporation. Frederic Fisher was vice-president and general manager of General Motors from 1924 to 1934, after which he and his brother Charles resigned. At the time of his death he held directorships in a score of companies. He died in Detroit, July 14.

Fisheries. The fisheries of the world, according to the tabulation of the U.S. fish and wild life service, annually yield about 17,500,000 tons, of 2,000 lb. each, of food and industrial products, with a value of about $762,000,000. The fisheries conducted in the North Atlantic area by bordering countries produce 7,550,000 tons, valued at $374,000,000; with the production by eastern North Atlantic countries amounting to 6,100,000 tons, valued at $310,000,000, and by western North Atlantic countries to 1,450,000 tons, valued at $64,000,000. The species of importance in the North Atlantic area include herring, cod, haddock, mackerel, halibut, swordfish, crabs, shrimp and oysters. The production of some of these species has declined, due to over-fishing or other causes. As this is a threat to the livelihood of many hundreds of thousands of fishermen and shore workers and to the food supply of nations, the various governments concerned took steps in previous years to conserve and sustain these fisheries. Because of the need for foodstuffs, created by the war situation, however, little was accomplished in this direction. In fact, in some of the warring countries conservation regulations were relaxed in an effort to increase fish production, without regard to the effect of unrestricted operations on the maintenance of fish supplies in the sea.

As a result of the war, generally, operations by warring nations were considerably curtailed. In Great Britain and the Union of South Africa it has been estimated that well over one-half of the fishing fleet was taken over by the admiralty. The remainder found it difficult to conduct fishing on the usual banks. In order to make up for the deficiency of its domestic fisheries, Great Britain looked to other sources for fishery foods. Considerable dependence was placed in supplies of salted and canned fish from Newfoundland and Canada, salted fish from Iceland and under the lend-lease program of the United States large quantities of canned salmon and sardines were sent to England from Alaska, California and Maine. Because of difficulties in securing refrigerated cargo space on transports and of holding chilled fish in cold storage in England, the importation of frozen fish was practically suspended. Furthermore, since the English people were accustomed to eating the domestic catch of fish in a fresh condition, frozen fish did not find ready sale. Efforts were made, however, to promote the use of the imported salted fish. A schedule of maximum selling prices for canned salmon, sardines, herring and pilchards continued in effect in Great Britain under orders of the ministry of food. Measures also were taken in Great Britain to regulate prices of other types of fish products, one measure prohibiting the sale of fish at wholesale except under licence.

While the situation in the warring countries was not conducive to normal fishing operations during 1941, various other countries took renewed interest in exploiting the fishery resources. For instance, the cessation of imported canned fish in New Zealand caused local fish canners to expand the canning of mullet, kingfish and oysters. Several fish canneries also were erected in Australia. In India the government issued instructions for curing fish. The government of Java conducted experimental trawling studies to locate new fisheries and technical work in fish preserving. Several Japanese floating crab canneries were converted over to codfish canneries and were said to have conducted operations in Bering sea during the summer.

The shrimp fishery on the west coast of Mexico was enlarged and a shrimp-freezing company, owned by Mexican nationals, was inaugurated. Chile conducted a sizeable fishery, a considerable portion of the catch being canned and marketed in other South American countries.

In some of the occupied countries the fisheries were again receiving attention. Fishing results in Denmark were exceptionally satisfactory. There was a good catch and domestic and export prices were high, due to a scarcity of meat. In Norway and Sweden efforts were made to expand fish oil production for fat stuffs. Norway also was using fish oil as a substitute for olive oil in canning sardines, and was developing a dried fish briquette. It is said this product could be stored for ten years at varying temperatures without suffering any damage. Germany contracted to purchase large quantities of codfish from Norway, much of which was re-exported to Italy. Also Norway arranged to export 40% of the 1940–41 winter herring catch to Germany and several other European countries.

The fisheries of North America, which annually yield over 3,000,000 tons on both coasts and in the interior waters, were prosecuted with renewed vigour in 1941. In Canada efforts were made to increase production of tinned fish to meet the demand for food in Great Britain. The pack of salmon in British Columbia amounted to about 2,500,000 cases, an increase of about 800,000 cases over the previous year, and there was a great increase in the output of canned herring. On the Atlantic coast of Canada experiments were in progress to develop a new type of dehydrated fish product for the warring countries to replace frozen or canned fish.

In Newfoundland the export market for salt cod, which is the main outlet for this product, improved. The government, however, continued its efforts to improve the economic status of the fishing industry by extending to the industry fishing guarantees and shipbuilding bounties, by encouraging co-operative associations among fishermen to reduce marketing costs, by the development of new exportable fishery products such as salted herring and herring meal and oil, and by developing methods for producing cod liver oil of higher quality.

The position of the fishing industry in the United States improved during 1941, brought about by a higher price structure and an increase in the production of fish to supply an increased demand among both the civil and military populations. During the year the United States government continued the purchase of fishing vessels for conversion into naval craft, most of which were replaced by new and more efficient vessels.

The international convention for the conservation of the North Pacific fur seal terminated in Oct. 1941 as a result of a notice of abrogation given by the government of Japan dated Oct. 23, 1940. Signator countries to the convention, made effective in 1911, were the United States, Great Britain, Japan and Russia (U.S.S.R.). Any treaty power may terminate the treaty

by giving one year's written notice to all other parties to the treaty. In 1941 the fur seal herd of the Pribilof Islands, administered under the convention by the department of the interior through the fish and wild life service, numbered over 2,338,000 animals. When the treaty became effective the herd numbered about 125,000 animals. In the interim, to and including the season of 1941, about 895,000 surplus animals were taken under regulated conditions for their pelts. Proceeds from their sale each year have been divided among the signator countries. The Japanese authorities had indicated informally that it was not the intention of the Japanese government to abandon the possibility of effecting a new convention for regulating the taking of North Pacific fur seals, and there would be no legislation in Japan before April 1942 relative to conditions under which Japanese nationals might engage in pelagic sealing.

The production of canned salmon in Alaska was greater in 1941 than in the previous year, amounting to about 6,865,000 cases. This was due mainly to a larger output of pink salmon. U.S. packers' stocks of all grades of canned salmon at the beginning of the last quarter of 1941 were about 1,500,000 standard cases, or about 100,000 cases less than on hand at the same time in 1940. The total pack of canned salmon in North America (Alaska, British Columbia, Pacific Coast states) amounted to 9,850,000 cases in 1941, compared with 7,000,000 cases in 1940. Increased quantities of fish and shellfish were frozen during 1941.

The U.S. government concluded an expedition to explore areas for king crabs off the Alaska peninsula and to conduct studies in the capture and canning of this shellfish which was begun in the fall of 1940. In 1941 three fishing vessels were used in the expedition. Operations were centred off the south coast of the peninsula during the early spring and along the north coast during the summer and early fall. The expedition returned to Seattle, Wash., about the middle of September. This fishery heretofore had been carried on by Japanese vessels and fishermen. As a result of this exploratory work by the U.S. government it was found that a commercial crab fishery was feasible, especially in Bering sea where the crabs are most abundant before and after the salmon season.

In various countries of South and Central America an interest was shown in exploiting local fishery resources. Attention was directed mainly toward producing marine products for domestic consumption to replace foods from abroad. In this connection individuals from several South American countries made investigations of the fisheries in the United States, and under the U.S. government's program for co-operation with other American republics several were assisted in fishery matters. In this connection a mission of fishery experts from the fish and wild life service conducted a survey of the Peruvian fishery resources. (*See* also FISH AND WILD LIFE SERVICE.)

During 1941 interest was continued by various countries in securing an adequate supply of fish oils potent in vitamins A and D. Exports of cod liver oil from Norway to the United States, ceased. Canada prohibited the export of cod liver oil except under licence approved by the Wartime Prices and Trade board, and in order to increase production a cod liver oil plant was established in Quebec. A strong demand, with prices higher than in the United States, resulted in increased shipments of Newfoundland cod liver oil in favour of Great Britain. In view of this condition, manufacturers and importers of vitamin fish oils in the United States continued to exert efforts to augment domestic supplies. The fishery in California for soupfin sharks, the liver of which is potent in vitamin A, was prosecuted intensively, and a new fishery was developed for this shark as well as dogfish in waters of the state of Washington. The meat of this shark and dogfish is of little commercial value. These were instances in the U.S. where a fishery was developed because of an unusual value placed on a visceral organ. The manufacture of synthetic vitamin D received impetus because of world events. One such product was based on irradiated cholesterol derived from sea mussels. The manufacture of this product also created a new fishery for sea mussels which was conducted along the coast of Virginia. Heretofore this mussel had little or no market value. In the United States interest also was shown in the extraction of vitamin A and D concentrates from certain low-cost fish oils, without rendering the original oil unfit for its normal use in the manufacture of soap, paint and other products. Efforts also were made during the year to locate sources of vitamin-bearing fish oils in other American republics. Some supplies were found in Peru and possibly in Argentina.

Whaling.—During the two decades from 1920 to 1940 the whale fisheries of the world were prosecuted with renewed vigour. Operations were centred almost entirely in the Antarctic. Previously little whale fishing was done in this area because of dangerous weather and ice conditions. In the recent years, however, such adverse conditions were no obstacle to the staunchly built factory ships and killer boats. The take was enormous. During the period from the season 1919–20 (the inception of the fishery on a large scale in the Antarctic) to the 1938–39 season, inclusive, 421,708 whales were captured in this region, from which 32,741,897 bbl. of oil were produced. Due to war conditions complete data were not available on the production in the Antarctic during the seasons 1939–40 or 1940–41. In the latter season it is believed the fishery there was conducted almost entirely by Japanese vessels. (*See* also OCEANOGRAPHY.)

Floods and Flood Control.

The world did not experience any large disastrous floods in 1941. Melting ice and snow caused many local floods in various parts of the world. These local flood waters caused some crop and property damage in many areas.

In the southwestern United States sudden violent rainstorms called cloudbursts took their usual toll by causing violent streams to arise in usually dry gulches, with disastrous damage to highways and railroads.

During the rainy season, on various parts of the earth's surface, floods occurred due to climatic conditions over which man has little or no control. When there is over 225 in. of rain falling on the headwaters of the Amazon river in Ecuador there must be inevitable floods in the lowlands in Brazil. Similar floods occurred on the Ohio and Mississippi rivers in the United States, on Hwang Ho in China, the Ganges in India and the Nile in Egypt although, according to available information, not to the extent as in some previous years.

In California, in January, February and December, floods due to torrential rains, caused severe damage approximating conditions resulting from the 1937 floods in this area.

The month-long rain in the Sacramento valley and in the headwaters of the Sacramento river and its tributaries caused the Sacramento river to pour over its levees, creating a lake which submerged some of the smaller towns and caused widespread damage to ranches, towns, highways and railroads.

There is little that man can do to protect himself from such floods as prevailed in California in 1941. Flood reservoirs, such as those projected by some engineers of the day, would be of trivial consequence in meeting such downpours and stream run-offs as those that occurred in some of the California sections. Under ordinary flood conditions they would doubtless prevent great damage at times, but when the heavens open, as they did during this period in 1941, and millions of tons of water are concentrated into the canyons and ravines within a very few hours, no ordinary works of man can hold them. Human beings must then pay for the advantages they acquired when they settled in the low spots.

The completion of the great Shasta dam on the Sacramento river, near Redding, Calif., by 1943 was expected to be helpful in controlling these flood waters.

In September, torrential rains in the Mogollon mountains made raging torrents of the Gila and Frisco rivers in southwestern New Mexico. Farm lands were inundated and damage to livestock was caused. The Hondo river inundated the streets in the residential district of Roswell, N.Mex.

The heavy rains which caused these floods extended into Mexico and 20 lives were lost in the floods in the village of San Vicente Chicoloagon on the Mexico City-Pueblo highway.

The rains caused the Missouri river to rise and some concern was felt regarding damage to the industries along the Missouri river. A major flood has not occurred on the Missouri river since 1903, but since that time many industrial plants in North Kansas City and Kansas City have been erected along the unprotected lowlands bordering the river.

Five miles of the Kansas City industrial section on the Kansas side of the river has been partially protected by the completion of a very elaborate levee. The September minor flood threatened the airport and temporary sandbag levees were erected to keep the water from the runways used by the Transcontinental airways. A flood of the size of 1903 would probably send 10 to 15 ft. of water over the municipal airport and destroy factories and industries in several districts and submerge much of the lowland area.

The control of floods by levees and dams in the headwater of the rivers and its contributaries is very helpful in flood control. Much has been done in this connection but much remained to be done. The great Boulder dam on the Colorado river has regulated the flood waters of that river for several years. The Bonneville and Grand Coulee dams on the Columbia river helped regulate the flood waters of this river although these two projects were primarily for the production of hydroelectric power.

(Ro. St.)

Federal Control.—General flood control legislation provided up to Jan. 1, 1942, authorizations totalling $930,400,000 for the construction of nearly 500 reservoirs and local flood protection projects widely dispersed throughout the entire United States. These projects were incorporated in comprehensive, co-ordinated plans for the beneficial development of the river basins of the nation, and they provided economic flood protection for a large number of centres of population and industry and to many thousands of acres of rich agricultural lands. Many of the authorized reservoirs were suitable for multiple-purpose use for flood control in combination with the development of hydroelectric power and other purposes.

The Flood Control act approved Aug. 18, 1941, modified certain conditions of local co-operation prescribed in previous flood control legislation. As the policy stood (Jan. 1, 1942) dam and reservoir projects, because of their general benefits over large areas, were usually built entirely at federal expense and were maintained and operated by the federal government. As the benefits provided by other types of flood protection projects were more local in character, contributions by the communities protected were usually required. The amount of this local co-operation of contribution depended upon the circumstances of each case, but generally the minimum requirements were that the local interests should provide without cost to the United States all lands, easements and rights-of-way needed for the project, hold the United States free from damages due to the construction works, and maintain and operate the works after completion in accordance with regulations prescribed by the secretary of war.

The act of 1941 authorized the construction of projects at about 90 localities and also modified several projects which had been approved in the previous Flood Control acts. Of particular note were the multiple-purpose projects for flood control, the generation of hydroelectric power and other allied uses which that act adopted. These were the Allatoona reservoir on the Etowah river, Ga.; the Whitney reservoir on the Brazos river, Tex.; the Narrows reservoir on the Little Missouri river, Ark.; the

SEVERAL PERSONS were drowned and hundreds were left homeless in the vicinity of Carlsbad, N.M. when the Pecos river overflowed its banks in May 1941

Bull Shoals and Table Rock projects on the White river in Arkansas and Missouri; and the system of reservoirs on the Grand (Neosho) river in Oklahoma.

The Federal General Flood control program had been under way continuously since 1937, when the first funds for that purpose were appropriated by congress. During 1941, 30 dams and 125 projects for local flood protection were under construction. Of particular importance were the several multiple-purpose reservoir projects for flood control and power which were being rushed to completion to augment the power demands of national defense industries. The more important of the latter type of project were the Denison reservoir on the Red river, Texas and Oklahoma; the Norfork reservoir in the White river basin in Arkansas; and the Wolf creek project on the Cumberland river, Ky. Additional important dams for flood control and power development were planned to be initiated early in 1942. Numerous reports on investigations authorized by congress were completed and submitted to congress in 1941. Many other authorized studies begun in previous years were carried on vigorously and a large number of new investigations were started in compliance with congressional directives.

One phase of flood control which became of great importance was its value to national defense. All flood control projects, being directly connected with the national economy, were either directly or indirectly related to national defense. This connection is entirely clear when it is remembered that one major flood in a large river basin, such as the Ohio or Mississippi, may cause in a short time many times the damage and disruption of industrial production that result from many air raids. The value of multiple-purpose reservoir projects producing power is obvious. Another type of multiple-purpose project important to national defense is a reservoir for flood control and stream flow regulation. The Berlin project on the Mahoning river, O., was expected, when completed, to protect the important steel producing areas of Youngstown and Warren, O., from floods and would increase the low water flow in the stream from which those industries obtain their industrial water supply.

Several local flood protection projects were also found to be of special importance because they protected vital manufacturing establishments. An example was the levee and flood wall for the protection of the Guyandot section of Huntington, W. Va., where a large nickel refining plant was located in a zone formerly subject to severe flooding from the Ohio river. (For a listing of floods occurring in 1941, *see* DISASTERS: *Natural Disasters.*) (J. L. S.)

Great Britain.—During the war there has been great activity in the control of floods in river areas, not only because of the damage to property by occasional floods but to reclaim arable land for the production of foodstuff; many thousand acres of such land have been brought under cultivation.

Increased interest has been taken in the catchment boards which in addition to controlling the rivers and streams, have sometimes to protect the coast from sea flooding. The East Norfolk Rivers Catchment board took over the control of about 10 mi. of coast line when, in Feb. 1938, the high seas made a breach, 1,800-ft. wide, and flooded a low-lying area of 15 sq.mi. cutting off villages and damaging farms and farm land. An attempt to close the breach was soon made but a further breach occurred in March. Steps were then taken for a permanent defense bank, the work of which has been successfully carried out.

The River Great Ouse Catchment board was formed to control the whole catchment area of the Great Ouse and its tributaries, covering an area of more than 2,000,000 ac. It is one of a number of districts adjacent to the Wash inlet from the North sea, into which flow rivers draining 5,850 sq.mi. of territory. In these rivers not only are there changes of levels by erosion in some areas and deposits of silt in others but the gradual seaward shifting of the coast line, at the head of the inlet, complicates the whole problem of dealing with the rivers.

The many schemes which have been tried, to reduce the volume of the flooding, have not been entirely successful. There were new schemes submitted to deal with the problem, each of which had certain advantages. One of the schemes included the digging of a new channel to divert the upland water into higher and more solid ground, the channel to begin at Grantchester and to discharge into the tidal river at St. Germans. The estimated cost of the whole scheme was about £3,460,000.

Egypt.—Two new barrages, at the apex of the Egyptian delta, for regulating the flow of water on the river Nile, were constructed on the Rosetta and Damietta branches of the river. These barrages take the place of others which were constructed between 1860 and 1870. Toward the end of the 19th century defects were found in the floors and the foundations of the barrages; to remedy the defects the effective head on the structures was reduced by construction of weirs downstream.

In order to pass more water down the three main canals the Egyptian government decided, in 1935, to construct new barrages under the name of the Mohammed Ali barrages; these were completed and brought into use in 1940. The cost of the works was approximately £2,500,000.

The Assuit barrage, on the river Nile, was remodelled in order to raise the level of the river, upstream of the barrage, so as to provide more water for the Ibrahimia canal.

India.—Schemes were in progress in 1941 in the Punjab to bring 1,000,000 ac. of the Thal desert under cultivation, designed to bring the Indus waters into an area between the Indus and the Jhelum rivers.

On the Sutlej river, also in Punjab, the proposed Bhakra dam site has a catchment area of some 21,460 sq.mi. on the Himalayas and it was proposed to impound about 5,000,000 ac.-ft. of water. (*See* also DAMS; FORESTS; IRRIGATION; METEOROLOGY; SOIL EROSION AND SOIL CONSERVATION.) (J. EU.)

Florida. An extreme southeastern state of the United States, called the "Peninsula state" because of its peculiar outline. Its coast line is greater than that of any other state, extending 472 mi. along the Atlantic and 674 mi. along the Gulf of Mexico. Area, 58,560 sq.mi., of which 4,298 sq.mi. are water surface; pop. (1940) 1,897,414, of which 1,045,791 were urban and 851,623 were rural; 1,384,365 white and 513,049 Negroes. Only about 60,000 were foreign born. Capital, Tallahassee (16,240). The larger cities are Jacksonville (173,065), Miami (172,172) and Tampa (108,391).

Florida gained an additional representative in the census of 1940, who was to be chosen in 1942.

The state elective administrative officers, whose terms expire in Jan. 1945, were as follows in 1941: Spessard L. Holland, governor; R. A. Gray, secretary of state; J. Thomas Watson, attorney general; J. M. Lee, comptroller; J. Ed. Larson, state treasurer; Colin English, superintendent of public instruction; and Nathan Mayo, commissioner of agriculture.

Education.—The state maintains two higher institutions of learning for whites: the University of Florida at Gainesville and the Florida State College for Women at Tallahassee, with enrolments of 3,438 and 1,968 students and teaching staffs of 197 and 143 respectively in 1941. The state's higher institution of learning for Negroes, the Florida Agricultural and Mechanical college, is located at Tallahassee and had an enrolment of 876 and a teaching staff of 81 in 1941. State appropriations for higher education for 1939–40 amounted to $2,299,760.

The biennial report of the state superintendent of public instruction for 1939–40 showed enrolment in the public schools through grade 12 as follows: white, 291,528; Negro, 105,460; total, 396,988.

There were 2,001 elementary and 828 secondary public schools in the state, with instructional staffs totalling 13,629 teachers, of whom 10,339 taught in the schools for whites and 3,290 in the schools for Negroes.

Municipally operated institutions of learning are the University of Tampa and St. Petersburg college. John B. Stetson university at DeLand, the University of Miami at Coral Gables, Rollins college at Winter Park and Southern college at Lakeland are privately endowed institutions.

Public Welfare, Charities, Correction.—Florida appropriated for pensions, benefits and public welfare about $13,756,000 in 1940–41. From grants by the federal government, the state received in 1940–41, for old-age pensions $2,892,206; for dependent children $490,421; and for pensions to the blind $214,181. There was collected from employers for unemployment insurance $26,910,821, from which benefits were paid out amounting to $13,533,551, leaving a balance with accrued interest in trust fund of $14,319,320. Considerable WPA and PWA money was expended in the state on which reliable total figures were unavailable in 1941.

Florida has no state penitentiary, but maintains a prison farm at Raiford, an Industrial School for Boys at Marianna and an Industrial School for Girls at Ocala. The appropriation for these institutions in 1941 carried the sums of $606,600, $155,280 and $59,500 respectively.

The state also supports a State Hospital for the Insane, the Florida Farm colony for the feeble minded, and the Florida School for the Deaf

and Blind. For the operation of these charitable institutions the appropriations were $1,578,010, $171,250 and $198,271 respectively in 1941–42.

Communications.—The total highway mileage of the state in 1941 was 13,378.6 mi., of which 8,000 mi. were paved or hard-surfaced. The construction costs in 1939 were $1,349,240.09 and the maintenance costs $3,256,951.43; while in 1940 the construction costs were $3,466,632.51 and the maintenance costs $4,176,638.37.

Florida in 1941 had about 6,000 mi. of railroads, of which the Atlantic Coast line, Seaboard, Florida East Coast and the Louisville and Nashville are the most important.

Banking and Finance.—On June 30, 1941, there was a total balance in the treasury of $13,323,115.68. The state is constitutionally forbidden to incur a debt except to put down rebellion or repel invasion, hence the state as such had no bonded indebtedness in 1941; however, the counties and municipalities had incurred in some cases a large bonded debt by issuing bonds, usually for roads and schools. Florida had no state income tax in 1941 and the state by constitutional amendment had abolished its *ad valorem* tax on real estate. Homesteads were exempted from taxation by local taxing units up to the value of $5,000.

On June 30, 1941, there were within the state 52 national banks with deposits amounting to $420,492,000 and 116 state banks and trust companies with deposits of $120,690,000, representing total deposits of $541,182,000, a gain in deposits of $89,350,000 in the fiscal year.

Agriculture, Manufactures and Minerals.—Agriculture is the most important industry in the state. In 1935 there were 72,857 farms with a total acreage of 6,048,406 ac., of which 1,142,767 were in crops, 489,006 were idle (fallow), 2,362,374 were in pasture, 1,140,941 were in farm woodland and the rest mainly in fruit.

The citrus production for the season 1940–41 and the estimates for 1941–42 were as follows: oranges (including tangerines) 29,800,000 boxes and 31,300,000 boxes; grapefruit 21,000,000 boxes and 21,400,000 boxes.

Table I.—*Principal Agricultural Products of Florida, 1941 and 1940*

Crop	1941	1940
Corn, bu.	7,533,000	9,031,000
Tobacco, lb.	12,125,000	16,123,000
Potatoes, bu.	3,190,000	4,312,000
Sugar cane, short tons	119,000	101,000

On Jan. 1, 1941, the livestock resources of the state were as follows: 753,000 beef cattle, 117,000 milch cows, 538,000 swine, 35,000 sheep, 20,000 horses, 41,000 mules.

Manufacturing.—The more important manufactures of the state in 1941 were lumber, naval stores (turpentine and rosin) and cigars.

In the 12 months' season, April 1940 to March 1941, Florida produced 4,328,000 gal. of gum turpentine and 294,000 bbl. (500 lb. each). Estimated 1940 output of lumber was about 602,000,000 bd.ft., mainly cypress and yellow pine.

The cigars manufactured in Florida are valued at about $20,000,000 annually. Tampa and Jacksonville are the leading cities in this industry. Tung oil and the production of paper pulp and the manufacture of paper are also important industries.

In 1937 the state had 1,835 manufacturing establishments, paying $36,501,359 to 52,005 workers and producing $217,044,982 worth of goods. In 1939 there were 2,083 establishments, paying $37,883,204 to 52,728 workers and producing $241,538,534 goods.

Mineral Production.—Florida has only limited resources in minerals, but has large and valuable deposits of phosphates, lime and limestone and less extensive, though highly valuable deposits of kaolin and fuller's earth. The mineral production of the state was valued at $13,060,453 in 1939 and $12,866,981 in 1940.

Table II.—*Principal Mineral Products of Florida, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Phosphate rock	$7,893,457	$8,773,680
Stone	1,462,730	1,223,438
Sand and gravel	779,708	672,106
Lime	215,472	185,286

(J. M. L.)

Flour and Flour Milling.

During 1941 the major influences affecting the flour milling industry were (1) the war and (2) the flour enrichment program. In the United States the latter influence was by far the most spectacular in effect and widespread in influence. In Canada and in Britain, however, the most significant developments of 1941 might be attributed directly to the war, although in some sections of the British empire the flour enrichment program was not without some effect.

Throughout the U.S. the flour and bread enrichment program developed with such rapidity that by the middle of the year a shortage of certain vitamins, particularly thiamin and nicotinic acid, became acute. For some time it appeared as though the entire program might be curtailed until the productive capacity of the vitamin producers could be sufficiently expanded to meet the unprecedented demand.

To some degree the situation with respect to fortified or "enriched" flour in Britain paralleled that in the U.S. except that owing to the absolute wartime control of the food industries—particularly the milling and baking industries—the fortification program was intentionallly retarded until the vitamin supply appeared adequate to provide the millers and bakers with sufficient vitamin concentrates to meet fully the standards of vitamin content which were set up by the ministry of health as announced on July 18, 1940. (*See* also VITAMINS.)

In Britain it was not until June 18, 1941, that Lord Woolton, the minister of food, announced that arrangements had finally been completed for the introduction of vitamin- and mineral-fortified flour in an area in South Wales. As sufficient supplies became available, it was expected that the enrichment program would be extended throughout England, in spite of the fact that there was some controversy over the ministry's intention of calcium fortification of flour and bread.

Credit for the exceptionally well co-ordinated development of the enrichment program in the U.S. is due to a large number of scientists, executives and government officials, including Dr. Russel M. Wilder, chairman of the Committee on Foods and Nutrition, National Research council; Dr. W. H. Sebred, U.S. Public Health service; Major General E. B. Gregory, quartermaster general in the U.S. army; Peter G. Pirrie, editor *Bakers' Weekly;* M. L. Wilson, assistant director of Defense, Health and Welfare Service in Charge of Nutrition, Washington, D.C.; and G. Cullen Thomas, vice president in charge of research, General Mills, Inc.

Standards of Identity.—U.S. federal standards of identity and definitions for flour and other wheat products were published in the *Federal Register* in May 1927. However, because of the shortage of riboflavin, the effective date with respect to vitamin content of "enriched" flours was postponed to Jan. 1, 1942. The riboflavin requirement, despite protests of the Millers' National federation, and others, was left the same as it appeared in the proposed standards published April 1, 1941, calling for a minimum of 1.2 mg. and a maximum of 1.8 mg. per lb. Other required ingredients, according to Paul V. McNutt's announcement, were to remain unchanged.

Production.—Wheat stocks reported as of July 1, 1941, were estimated by the Crop Reporting board, Washington, D.C., at 73,240,000 bu., which is more than double the 33,618,000 bu. held in interior mills, elevators and warehouses on July 1, 1940, and is the highest July 1 interior stocks of any year since these estimates had been made. These figures indicated that there should be no shortage of wheat for flour production in the North American continent during 1942.

Japan, on the other hand, because of its inability to obtain flour or wheat supplies from the Americas, would, according to a report of the Canadian trade commissioner in Tokyo, be rather short on wheat flour requirements. According to reliable estimates of the Japanese National Millers' association, Japan requires at least 7,000,000 bbl. of wheat flour per year, while the milling capacity of Japan is only 1,500,000 bbl. Because of the trend toward the occidental mode of living, there has been a gradual replacement of wheat flour for rice flour, and wheat bread had become, prior to the war, an important article in the daily diet of the Japanese.

Production of flour in the U.S. during 1941 reached the greatest total since the season of 1931–32, output for the crop year ending June 30 amounting to 105,330,437 bbl., representing an increase of about 900,000 bbl. over the production of the previous crop year.

Further gains in U.S. production of flour were reported Nov. 10, 1941 by the bureau of the census of the department of commerce. The output for Sept. 1941 amounted to 9,495,471 bbl., compared with the August total of 8,592,209 bbl. For the first nine months of 1941 a gain of 1,668,102 bbl. over 1940 was reported, according to data representing 94.6% of the total U.S. milling capacity.

Wheat-Peeling Process.—A new wheat-peeling process for the manufacture of a new type of whole wheat flour was announced on April 7 by M. Lee Marshall, head of the Continental Baking company. The process employed was described as "revolutionary" and embodied the use of a number of flotation cells, lined with rubber, against the insides of which the wheat is impelled with sufficient force to fracture the branny layers without crushing the endosperm. This process was developed and patented by Theodore Earle, a mining engineer of southern California. The new "whole wheat" flour made by Earle's process was first produced in the latter part of February and the mill at Kansas City, which was designed and built according to Earle's specifications, had been operating at its full capacity of 1,000 bbl. per day since the first of March 1941. Fluorspar.

World production of fluorspar is 500,000 metric tons, of which the United States produces about one-third, Germany slightly less and most of the remainder comes from the soviet union, France and Great Britain. The United States output increased heavily in 1940, to 233,600 short tons, and consumption to 217,200 tons. Both mine and consumer stocks increased to a total of 164,500 tons. Imports dropped to 11,871 tons.

mostly from France, Newfoundland and Mexico. (G. A. Ro.)

Football.

Football, generally, had a normal season in the United States in 1941. Conscription took few players, and in the main the teams suffered little in loss of personnel or at the box office, though the outlook for 1942 was dubious unless hostilities should be brought to an early conclusion.

For the United States as a whole, there was an increase in attendance of 4% over 1940. Every section shared in it with the exception of the Pacific coast, where the quality of the football was not quite up to the usual high standard. The record crowd of the season—100,000 persons—saw Navy defeat Army for the third successive year. The Southern California-Stanford game at Los Angeles drew 87,000 and Michigan attracted 85,000 for its meeting with Minnesota and the same with Ohio State. Notre Dame played to well over 400,000 and Pennsylvania drew 358,000 for its six home games.

The outstanding team of the country was Minnesota. For the second successive year, the Golden Gophers beat all opponents, running their winning streak up to 17. They were voted the No. 1 team of the country in a national poll.

Behind Minnesota were ranked Duke, Notre Dame, Texas, Michigan, Fordham, Missouri, Duquesne, Texas A. and M. and Navy. Also strong were Northwestern, which lost to Minnesota and Notre Dame by a point each, Pennsylvania, Oregon State, Mississippi State, Ohio State, Georgia and Harvard.

Minnesota, Duke, Notre Dame and Duquesne went through without defeat. Notre Dame was tied once, by Army, which made big strides under its new coach, Earl Blaik. Notre Dame, under its new coach, Frank Leahy, enjoyed its first unbeaten season since 1930, Knute Rockne's last year. Leahy, continuing his marked success at Boston college, was voted the coach of the year, barely beating out Bernie Bierman, whose Minnesota teams had won eight Big Ten championships. The outstanding player of the season was Minnesota's great halfback, Bruce Smith, who was voted the Heisman Memorial trophy over Notre Dame's famous sophomore passer, Angelo Bertelli.

The sectional champions were as follows: Big Ten, Minnesota; Big Six, Missouri; Pacific Coast, Oregon State; Southwestern, Texas A. and M.; Southern, Duke; Rocky Mountain, Utah; Missouri Valley, Tulsa; Southeastern, Mississippi State. Fordham was voted the No. 1 team of the east in the balloting for the Lambert trophy, and Navy, Duquesne and Penn were outstanding also. Navy won the Ivy Crown; Harvard, the Big Three; and Williams, the Little Three.

Oregon State was picked to represent the Pacific coast in the 1942 Rose Bowl game for the first time and invited Duke as its opponent. The game was transferred, because of the war, from Pasadena, Calif., to Durham, N.C., and was won by Oregon State, 20 to 16.

In the Sugar Bowl at New Orleans, La., the rivals were Fordham and Missouri. Victory went to Fordham by the score of 2 to 0.

Texas A. and M. and Alabama met in the Cotton Bowl at Dallas, Tex., the latter winning by 29 to 21.

In the Orange Bowl at Miami, Fla., Georgia won from Texas Christian, 40 to 26.

The big surprises of the season were furnished at the expense of Texas and Fordham. Texas, rated the best team in Longhorn history, suffered a stunning tie with Baylor and then was beaten by Texas Christian. Dana Bible's team vindicated itself later by decisively ending the winning streak of Texas A. and M., as it did in 1940, and then concluding with an amazing 71–7 rout of Oregon. Fordham, after winning its first five games, was the victim of Pittsburgh, which had lost five in a row.

Aside from Ossie Solem's reversal of his centre at Syracuse, to pass the ball facing his backfield, there was no innovation in offense comparable with the revival of the T formation by Stanford and the Chicago Bears of the National Professional league in 1940. Harvard caused a stir with the variety and flux of its defense, using as many as 28 variations and a sliding, looping line that confused opponents' blocking assignments. The new free substitution rule worked out satisfactorily.

Professional Football.—Professional football also had a thriving season. The New York Giants, after clinching the eastern championship, drew 55,000 in their final game with Brooklyn, which was too good once again for the Giants. The Chicago Bears, 1940 champions, and the Green Bay Packers tied in the Western Division, and in the playoff, before 43,000 in Chicago, the Bears won by 33–14. The Bears and the Giants then met for the national crown at Chicago and the Bears won by a score of 37 to 9.

Canada.—As in the United States, football continued to have a large following in the dominion despite the war, though the restrictions imposed upon all intercollegiate athletics since the outbreak of hostilities remained in force.

The East-West final for the dominion championship, abandoned in 1940 because of the failure of the western representatives to conform to the rule of the Canadian Rugby union regarding the use of interference, was renewed. The rule was changed, allowing linemen to block five yards ahead of the line of scrimmage and backs one yard ahead, as compared with three yards ahead for linemen and one yard behind the line of scrimmage for backs under the old rule. The rule permitting forward passing from any point behind the line, in force in U.S. professional football and followed for several years in western Canada, was accepted by the Canadian Rugby union as legal.

The Winnipeg Blue Bombers, Western Interprovincial Football union champions, won the dominion crown and the Grey Cup by defeating the Ottawa Rough Riders, eastern champions, 18–16, before 20,000 at Toronto. The Blue Bombers were national champions in 1939 also. They won the western title for the fifth successive year by defeating the Regina Roughriders 8 to 2 in the rubber game after losing the first 8 to 6 and winning the second 18 to 12.

The Ottawa Rough Riders defeated the Hamilton Wildcats for the eastern championship by 7 to 2. They had previously taken the championship of the Big Four by winning the two-game series with the Toronto Argonauts on a total point basis, 18 to 17. The Argonauts won the first contest 16 to 8 and the Rough Riders took the second, 10 to 1. (A. Da.)

Great Britain.—The organization of rugby and association football, amateur and professional, in 1941 proceeded on much the same lines as in the previous year. In the rugby union game professionals serving with the forces played with the amateurs, and in view of the fact that professionals and amateurs in peacetime follow different rules, it was interesting to see how well they fitted in. The outstanding sides were Cambridge university and Saint Mary's hospital. Cambridge beat Oxford at Cambridge fairly easily, while St. Mary's won nearly all their matches, though when it came to the "sevens" at the end of the season they were beaten by Middlesex in the hospitals competition and by the Welsh Guards in the Middlesex competition. G. T. Wright, the Cambridge outside half, and T. A. Kemp and F. M. McRae of the St. Mary's side were among the best players of the year. In services' football Hayden Tanner, the Welsh international scrum half, who captained the Welsh Guards, was outstanding. Late in the year a rousing match between the army and the R.A.F. at Richmond ended in the army's winning by the surprisingly large score of 30 points to 3. Vice-Admiral N. A. Wodehouse, one of England's most famous rugby players, was killed in action during the year. He played for England regularly from 1910–13, and captained the 1912–13 side that beat Scotland, Wales, Ireland and France, the first time this had ever been done. Leeds won the rugby league final, beating Halifax (19–2).

In association football Leslie Compton, the Arsenal player and brother of the famous cricketer, performed an interesting feat. He was chosen to play against Clapton Orient at fullback, later being asked to play at centre half. On the day of the match the manager decided to play him at centre forward, and he scored 10 goals. Many international matches were played, England *v.* Scotland (twice), and England *v.* Wales (twice). England won three out of four, losing to Scotland at Newcastle (3–2), but winning (2–0) at the second meeting at Wembley in October. Stanley Matthews, Stoke City outside right, and E. Hapgood, the Arsenal fullback and England captain, were perhaps the best players of the year. Preston North End was undoubtedly the best English team of 1941, since they won both the league war cup, beating the Arsenal (2–1) after a replay, and the north regional championship. In Scotland the war cup was won by the Rangers, and in Ireland the Irish F.A. cup by Belfast Celtic. (D. R. G.)

Foreign Exchange: *see* EXCHANGE CONTROL AND EXCHANGE RATES.

Foreign Investments in the United States.

Foreign investments in the United States, long- and short-term, were estimated at $9,695,000,000 at the end of 1940. The in-

crease during that year—just over $100,000,000—was considerably less than that of other years. The principal changes that occurred during 1941 were the result of capital movements which were clearly affected by the course of the war. For instance, foreign holdings of the common shares of the U.S. corporations declined in value by about 20%, largely because the British treasury was selling the mobilized investments of British nationals. A decline in the average market price of common stocks was a further factor reducing the value of the common stocks held abroad.

Increased foreign deposits in U.S. banks, which more than offset the decline in foreign investments in common shares, were also traceable to the war. There was not much change in these deposits until April 1940 when the invasion of Denmark and Norway by Germany created widespread concern among neutral European countries. The later attacks on and occupation of Belgium, the Netherlands and France intensified the flow of foreign balances to the United States, and during the latter part of May and during June and July 1940 the inflow was extremely large. A considerable part of this movement was for the account of foreign central banks and governments. In fact, a large part of the gold reserves of European countries was shipped to the United States during 1940 to be held under earmark in that country or to be converted into dollar balances. Later, as some of the countries were invaded by Germany, the United States extended the freezing control, with the result that withdrawals later in 1940 were greatly curtailed, often completely stopped. French deposits were increased greatly in June 1940. A large shipment from the gold reserves of the Bank of France arrived in New York about the time of the Franco-German armistice, and the proceeds were blocked when foreign funds' control was extended to cover the dollar assets of France. The increase in official balances was furthered by the shifting of accounts from private ownership, particularly by Canada and Switzerland.

Although Canada, the United Kingdom and France during the period of its belligerency, were making large purchases of war material in the United States, they did not reduce their balances in American banks to any considerable extent, because their deposit accounts were continually being replenished from the proceeds of the sales of gold.

Imports for the account of the British empire were estimated at $2,800,000,000, and those for France amounted to a further substantial sum. By the utilization of their gold reserves and current production those countries were able to purchase supplies in the U.S. without reducing their working cash dollar balances greatly and without selling earning assets, such as stocks and bonds, until late in 1940.

After the defeat of France, Great Britain took over most of the French commitments or contracts for aeroplanes and other war supplies. The need for dollar balances was very great and, inasmuch as its gold reserves were nearly exhausted, it became necessary to sell the mobilized dollar investments of British nationals. The sales of listed securities were arranged by the special agent of the British treasury, through the syndicates of bankers and brokers. Sales of small blocks were effected on the floor of the exchange but the large blocks were sold by special offering after the close of the exchange trading period. Such sales were made in considerable volume from Oct. 1940 through March 1941.

In the spring of 1941 it became apparent that the British government would have to liquidate some of the so-called British direct investments in the United States. In March it was announced that a banking syndicate had been organized in the U.S. to underwrite the sale to the public of the shares of the American Viscose company. This company, the largest producer of rayon yarns in the United States, was a wholly owned subsidiary of Courtaulds, Ltd. The book value of the Courtauld investment was more than $100,000,000. The amount realized by the British government from the sale of the company was $54,348,923. Further sales of this character were not necessary because the passage of the Lend-Lease bill on March 11, 1941, relieved the British government of the necessity for hurried liquidation of its dollar assets. Additional relief was given by amending the Reconstruction Finance Corporation act (June 10, 1941) to permit loans on the collateral of United States securities. In this manner the United Kingdom was freed of the task of liquidating such a large volume of securities. Under these provisions a loan to the United Kingdom of $425,000,000 was announced by the RFC on July 1, 1941.

Other changes in foreign investments in the United States were of minor importance. As of the end of 1940, United Kingdom investments (long- and short-term) were estimated roughly at $2,400,000,000, Canadian at $1,430,000,000, those of continental Europe at $4,200,000,000, and the rest of the world, $1,665,000,000. A large part of the investments of continental Europe had been subjected to foreign funds control measures when Belgian, Dutch and French dollar assets were included in May and June 1940. Various small countries were added to the list of those affected later in the year and in the spring of 1941. On June 14 the foreign funds control was extended to include all countries of continental Europe, including Switzerland. The order (no. 8389), as amended at that time, provided also for the registration of all foreign assets in the United States. On July 25, 1941, the assets of China and Japan were frozen. The effect of these measures of control was to prevent changes in the investments except under licence from the treasury department.

Foreign funds control, as conceived at the time of the invasion of Scandinavia, Belgium and the Netherlands, was intended primarily to protect the assets of those countries from seizure by Germany. As the world designs of the nazis became clearer in the United States, the control began to be considered as one of the measures of national and hemisphere defense. The actions of June 14 and July 25 in freezing German, Italian and Japanese assets, as well as those of neighbouring states, were frankly aggressive steps against the axis.

There was a continuation of the flow of refugee capital to the United States in 1940, although probably to a lesser extent than in previous years because of more stringent exchange controls abroad. Naturally, such a flow of funds was carefully concealed and its volume not known. This capital took many forms in the United States, namely, bank deposits, holdings of stocks and bonds, real estate and business enterprises. (*See* also EXCHANGE CONTROL AND EXCHANGE RATES.)

Foreign Missions. During 1941 the wars in Europe and the far east brought increasing problems to Christian foreign missions. In Germany and even in unoccupied France and in Scandinavia, the giving to missions held up remarkably well. However, this money could be sent with difficulty or not at all to those for whom it was intended. In this emergency, Christians in other countries, notably in the United States, came to the rescue. For Protestants, the International Missionary council acted as a transmitting agency. Funds were forthcoming in sufficient amounts to prevent any of the Protestant "orphaned missions"—those cut off from their supporting constituencies—from closing. In the far east the increased tension between Japan on the one hand, and the United States and Great Britain on the other, led to the removal of a very large proportion of the citizens of the latter two powers, including missionaries, from the Japanese empire and the Japanese-occupied parts of China. This particularly affected the Protestant missionary staffs, since these were chiefly from the Anglo-Saxon countries, while the Roman Catholic missionaries were mainly from Germany, Italy and France, with which, through its pact with the axis, Japan was associated.

By the close of 1941 nearly nine-tenths of the Protestant missionaries had withdrawn from Japan and large numbers had come out of occupied China. The governmental freezing of funds made difficult the transmission of money to the missions in the far east. In Japan the union of the Protestant denominations was consummated. All the chief bodies except the Anglicans came into it. The intensification of the war in the near east, especially in Syria, brought embarrassment to the missions in those lands. Yet missionaries, old and new, continued to come from and go to their fields. (K. S. L.)

Foreign Trade: *see* AGRICULTURE; INTERNATIONAL TRADE.

Forests. A single French army corps is said to have used up to 30,000 trees daily in World War I, during which England sacrificed timber in its game preserves and shade trees on the home estates.

In the struggle which began in 1939 there was obvious need for wood for such things as pontoon bridges and railroad ties, crates, ships, cantonments, hospitals. But there was also need for wood and plywood in training planes and for wood charcoal in gas

masks. Glycerol, obtainable from wood, is a source of nitroglycerin. The latter, mixed with sawdust, becomes dynamite. Sawdust, transformed into wood plastics, makes instrument panels, switchboards and hundreds of other articles.

This is only a fragmentary listing of the role forests were playing on the armed front in 1941. On other fronts they were helping to prevent damage by erosion and floods to croplands and cities; to fill rapidly expanding needs for outdoor recreation; to furnish wood and wood products for countless everyday uses; and, through forest-land forage, to produce meat, wool and leather.

Although there probably always will be need for better administration of the national forests, their major contributions to armed and other fronts were made through practices which, besides using the resources, also protect and renew them and improve the power of the land to produce. But destructive cutting and fires on privately owned forest land have been responsible for most of the 80,000,000 acres that are practically devastated, and for additional millions of acres with forests so depleted and inferior that they were in 1941 producing only one-third to one-half as much as they can and should.

This is significant. For the best and most productive three-fourths of all forest land in 1941—from which are obtained about 95% of forest products—was in private rather than public ownership and, although an increasing number of far-sighted leaders adopted better forest practices, about 80% of all privately owned timberland was without conscious care for the perpetuation of its forest resources except for fire protection on part of it.

Destructive cutting, greatly accelerated because of the war, was also unfortunate. For it was unnecessary, even for defense, and it contributed to deplorably unfavourable social and economic conditions—including most of the worst of rural slums—within some 1,250 out of the 3,000 odd counties in the United States.

With these conditions in mind, and because forests should be instruments through which to secure such things as more and better homes and more jobs and more permanent ones for more and more people, the department of agriculture and the forest service included in the program they advocated two measures offering assurances that the U.S. forest problem would be solved.

The first of these measures was nation-wide public regulation of forest practices on privately owned forest land. This would establish standards that are simpler than most of those already adopted by a number of leaders among private owners of forest land but that, as a minimum, would (a) stop further destruction and deterioration of forests generally, and (b) keep all forest lands at least reasonably productive.

The second measure that would give positive assurances was a substantial increase in public ownership by communities, states and the federal government. This should take over forest land submarginal for private ownership and other forest land—like that vital for watershed protection—in which the public interest could not be safeguarded in any other way.

Even with this second measure there was a large part of the forest land in the U.S. (more than half of the best of it, according to current estimates) that would remain in private ownership unless its owners failed to redeem their resource and social obligations. There were in 1941 also many serious and diverse problems that affected most private owners of forest land, and there was a broad but definite public interest in the forest land they owned.

In addition therefore to the two measures, the department and the forest service also advocated various forms of public co-operation designed to help private owners with problems like protection against forest fires and other measures designed to help meet the widespread demand for more and better public services than could be rendered then through the national forest system.

This system included 177,652,648 acres of land, publicly owned or approved for purchase, in 42 states and 2 territories. Like many community and state forests, the national forests were managed on that regulated multiple-use basis designed to build up productivity of land and resources while assuring the greatest combined benefits for the greatest number of people in the long run.

In 1941 the national forests contributed to social and economic security through transactions like the 25,550 sales that involved 1,400,000,000 bd.ft. of timber and the 47,260 permits to graze 6,300,000 head of domestic livestock; and through uses made during the more than 16,000,000 visits by people to improved camp and picnic grounds, winter sports areas, organization camps and resorts.

Contributing more directly to defense, approximately 700,000 acres of national forest land in the U.S. were made available to the war department, and investigations were made and advice given about problems like those involving wood as a substitute for key materials like aluminum, wood for plugs for naval shells and conversion of wood into chemicals and nitrating pulps.

The forest service also detailed experts to train men in aeroplane factories; made arrangements so that 3,200 lookout stations, 63,000 mi. of telephone line and some 3,000 radio stations in the national forests might, if necessary, be used for reporting the approach and movement of hostile aircraft; redesigned a shipping container for bombs, for example, so that it used less wood, weighed less, had greater strength and required less cargo space; and co-operated with many farm and industrial timberland owners to help improve their cutting and forest management practices.

(E. H. CL.)

British Empire.—The efforts of the forest departments throughout the empire were in 1941 mainly concentrated on the war effort. Staff was considerably reduced by the absence of officers and men serving in H.M. forces or in other war duties, such as timber control. The reduced staff had in many cases to deal with increased demands for timber and other forest products, both for the supply to Great Britain and to replace timber previously imported which was unobtainable owing to lack of shipping. Timber control was in force in most of the dominions during 1941.

The necessity of using local supplies of timber undoubtedly led to a better appreciation of indigenous timbers and to the products of exotic plantations, especially in South Africa, Australia and New Zealand. Quite apart from justifying the policy under which the plantations were originated, the increased reliance on these timbers overcame previous prejudices against them and showed that they could be fully justified from a financial point of view.

The lessons of 1914–18 and of World War II showed the necessity for a greater activity in forest management in all forests and of further encouragement, and the institution of some control of privately owned forests. In Great Britain, the leading forestry societies paid special attention to the future of private forests and elaborated plans for better management and control of these forests to be placed before the government for action after the war. In Canada, likewise, the Society of Forest Engineers was framing the lines of a future forest policy to be recommended. Other parts of the empire were also looking to the future and it was generally realized that war must result in a further appreciation of the imperial importance of the forests of the empire. In the colonial empire, the importance of forests in relation to the welfare of the people was being recognized. Not only do they provide the means for improving the standard of living of many of the inhabitants, but they are also essential for the protection of the most fundamental of all resources, the fertility of the land. The Colonial Development and Welfare act should be a powerful aid to placing the conservation of forests in the interests of local inhabitants on a sounder footing.

As far as the greatly denuded staffs were able to deal with other activities in addition to the supply of timber and other products required for the prosecution of the war, the normal work of forest conservation, protection, regeneration and improvement, together with research in all branches, were being carried out as much as possible under the circumstances of total war. (*See* also LUMBER.) (H. R. BD.)

Formosa (TAIWAN), a large island in the western Pacific, separated from China on the west by the Taiwan straits and from the Philippines on the south by the Bashi and Balintang channels. Area, 13,429 sq.mi.; pop. (1938), 5,746,959, of whom 308,845 were Japanese; capital, Taihoku. There were 43,405 aborigines in the mountainous interior of the country; but the majority of the population is of Chinese stock, the island be-

ing acquired by Japan after the war with China in 1894–95. The governor general in 1941 was Admiral Seizo Kobayashi.

Formosa, with its important and jealously guarded naval base at Mako, in the Pescadores, was a valuable base for Japanese naval and air operations against China and, in Dec. 1941, against the neighbouring Philippines.

Trade, Agriculture, Mining, Industries.—Formosa's overseas trade in 1939 was valued at 592,938,000 yen (exports) and 408,650,000 yen (imports). Trade with Japan proper and its territories accounted for 509,745,000 yen of exports and 357,608,000 yen of imports. The Taiwan budget for 1940 was 260,530,226 yen, and the average note issue of the Bank of Taiwan in 1939 was 146,460,000. Formosa's largest articles of export are sugar and rice. The island is one of the world's chief sources of camphor; the fertile coastal plains also produce tea, pineapples and citrus fruits. Sugar output, which had been pretty constant in the neighbourhood of 1,600,000,000 kin (a kin is about 1⅓ U.S. lbs.) from 1935 until 1938, leaped to 2,364,550,976 kin in 1939. Inasmuch as there had been a growing shortage of sugar in Japan, leading to stringent rationing of this product, it seemed to be a reasonable assumption that there was a substantial expansion in the industrial and military uses of the product in 1939–41. There are government monopolies in the sale of opium, camphor, salt, tobacco and sake, the Japanese rice wine. Formosa contains mineral resources, of which gold and coal are the most important, although mining is of secondary importance in the economy of the island. During the decade 1931–41 there was a considerable amount of hydroelectric power development, and spinning and chemical industries were established.

(W. H. Ch.)

Fougner, G. Selmer (1884–1941), U.S. newspaperman and gourmet, familiarly called "the Baron," was born Aug. 24 in Chicago. He developed an interest in gastronomy while he was a student and later a newspaper correspondent in France. When the United States entered World War I in 1917, he returned to the U.S. to serve as publicity agent for the treasury department. In 1933, on the eve of prohibition's repeal, he became the "official gourmet" of the New York *Sun* and wrote a column, "Along the Wine Trail," devoted to helping Americans bridge the abyss from bathtub gin to refined drinking. Intrigued by the romance and history of foods, he founded 14 epicurean societies and enjoyed a wide reputation as a connoisseur among gourmets in the U.S. and on the continent. He died in Washington, D.C., April 2.

Foundations: *see* Donations and Bequests and foundations under their specific names.

Four-H Clubs. All 4-H club members during 1941 participated in the 4-H seven-point program for national defense. Major emphasis was placed on demonstrations in the increased production of food, as well as in the construction of clothing and home equipment for better family living; conservation of human and natural resources on the home farm and in the local community; development of the health of the individual and the community; acquirement of useful technical and mechanical skills; practice in and appreciation of the democratic way of life; development of an understanding of present-day social and economic forces; and the interpretation of the total national defense program to the community. Following the declaration of war a "Victory Program for the 4-H Clubs" was developed providing for more intensive contributions on the part of these rural young people.

Enrolment in the 4-H clubs totalled more than 1,420,000 in 1941, the membership being composed of rural boys and girls ranging in age from 10 to 21 years. Of these, approximately 625,000 were boys and 795,000 girls. The 4-H clubs are conducted by county extension agents co-operatively employed by the state colleges of agriculture, the United States department of agriculture and county governing bodies and local organizations, as a part of the program of co-operative extension work in agriculture and home economics. Assisting in the 4-H club work during 1941 were 154,600 volunteer local leaders, usually local farmers, homemakers and former club members.

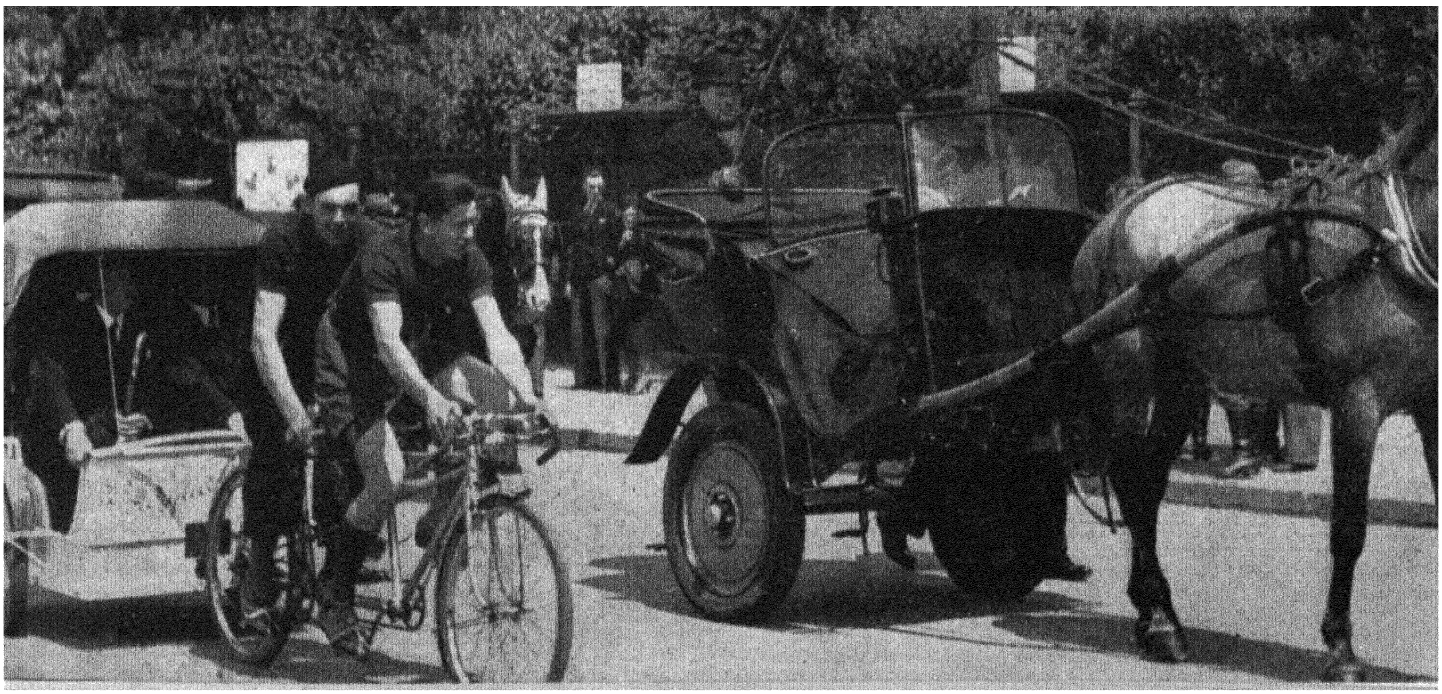
The 4-H clubs are organized on a community basis usually, although in some states they are organized according to the demonstrations conducted by the members. In 1941 there were 79,721 local 4-H clubs, representing practically every county in the 48 states and Alaska, Hawaii and Puerto Rico.

National 4-H club events in 1941 included the National 4-H Club camp held in Washington, D.C., June 18–25; the 4-H division of the National Dairy exposition held at Memphis, Tenn., Oct. 11–18; and the National 4-H Club congress at Chicago, Ill., Nov. 29–Dec. 6.

(M. L. W.)

France. A state situated in the west of Europe; bordered N. by Belgium and Luxembourg, N.E. by Germany, E. by Germany and Switzerland, S.E. by Italy, S. by Spain, with the Mediterranean sea on its southeast coast, the Atlantic ocean on the west, and the English channel and the North sea to the north. Area, 212,736 sq.mi.; pop. (est. April 1, 1941), 39,302,511, exclusive of war prisoners; provisional capital, Vichy; chief of state, Marshal Henri Philippe Pétain (*q.v.*). By the armistice of June 22, 1940, France was divided into two zones, the occupied and the unoccupied (*c.* 85,000 sq.mi.); the line of demarcation is drawn from the Swiss frontier near Geneva to a

RUBBER-TIRED CHAISES and bicycle taxis were fashionable replacements for motor cars during 1941 in occupied France



point 12 mi. east of Tours and thence southwest to the Spanish frontier at St. Jean-Pied-de-Port. Thus, although the Vichy government has theoretical administrative authority over both zones, three-fifths of the country, and that the richer part both agriculturally and industrially, is occupied by the Germans. Language: French; religion: Roman Catholic; *c.* 1,000,000 Protestant.

History.—Throughout 1941 the terms of the Compiègne armistice were the most powerful determining factor in French politics. All intercourse between the occupied and unoccupied zones was rigorously controlled by the Germans, which greatly complicated the efforts of the Vichy government toward reconstruction. Moreover, during 1941 the Germans collected the enormous sum of 122,000,000,000 francs for costs of occupation, a sum equivalent to about $3,050,000,000. In May the costs were reduced from the rate of 400,000,000 to 300,000,000 francs a day. Inasmuch as unofficial estimates place the actual costs of occupation at no more than 125,000,000 francs a day, part of the surplus was used by the Germans, it is alleged, to purchase an interest in, and (in some cases) outright control of, French businesses. In addition, the German government had, according to the official statement of the Bank of France of Oct. 23, an unused credit of 63,423,000,000 francs; by Oct. 31 the Bank of France had advanced to the French government a total of 129,000,000,000 francs for occupation costs.

On July 2, 1941 it was officially announced that the total number of French war prisoners had been 1,800,000; by the end of the year, according to official Vichy figures, 1,426,422 still remained in German custody.

Though in his famous interview with Hitler at Montoire on Oct. 24, 1940, Pétain accepted the principle of "collaboration," from then, throughout 1941, events revolved around the differences between the French and the German interpretations of that extremely ambiguous word. By his dismissal of the ardent "collaborationist," Pierre Laval (*q.v.*) Dec. 13, 1940, Pétain precipitated a protracted crisis with Germany. On Dec. 24, 1940, minister of the navy, Admiral Darlan (*q.v.*) had presented to Hitler Pétain's explanation of Laval's disgrace. No German reply was received for several weeks. On Jan. 19 Pétain and Laval had an inconclusive conversation at La Ferté-Hauterive. On Jan. 27 constitutional act no. VII was published. It required ministers and other high officials to take an oath of loyalty to Pétain personally, and gave him the retroactive authority to punish any official for misdeeds committed from 1932–41. The marshal was also empowered to banish or imprison ministers on his own authority.

On Feb. 8 Laval declined an offer to be minister of state. This refusal paved the way for the rise to power of Darlan, an equally ardent "collaborationist." On Feb. 9 Darlan became foreign minister (succeeding Pierre Etienne Flandin), and director of the information service, while remaining also minister of the navy. By constitutional act no. VIII, issued Feb. 11, he was named vice-premier, and Pétain's eventual successor, and was also appointed vice-president of the council of ministers. On Feb. 24 he added to his other portfolios that of the ministry of the interior, and in the quarterly budget, published April 3, an extra 265,000,000 francs was allotted to that ministry for secret police. In a broadcast of April 7 Pétain emphasized that "Admiral Darlan enjoys my complete confidence." On May 6 a decree stipulated that in all large cities the police would thenceforth be national, under the jurisdiction of the minister of the interior. Darlan relinquished the ministry of the interior on July 18, but his successor, Pierre Pucheu, was a trusted Darlan henchman. On Aug. 12 Darlan became defense minister, in addition to his other offices, with supreme command in matters of defense over the army, navy, aviation and the colonies. In this way Gen. Maxime Weygand (*q.v.*), delegate general of the French government in Africa, was subordinated to Darlan's orders. Finally, following the death in an air crash on Nov. 12 of Gen. Charles Huntziger (*q.v.*), minister of war, Darlan became temporary minister of that department, a post which he still held as the year ended. He is alleged to have been industrious in "purging" officials upon whose allegiance he could not implicitly rely.

FRENCH MANIKINS paraded new styles at Auteuil, near Paris, in July 1941—as they did in the years before France's defeat

Admiral Darlan is an Anglophobe, principally because of the British attack upon the French fleet at Oran in July 1940. On March 10 he called the British blockade "imbecile," and declared that the Germans, who had given 2,000,000 quintals of wheat, were more generous than the British. Two weeks later it leaked out that the German "gift" was in reality only a part of a barter agreement. The public possession of this news moderated Darlan's ire, as well as the agitation in the U.S. for supplying foodstuffs to France.

During 1941, as in 1940, Vichy France experienced great difficulty in holding its empire together. On Jan. 23 Japanese mediation was accepted in the four-months-old undeclared war between Thailand and French Indo-China, and on March 11 an agreement was initialled at Tokyo which ceded some important border districts to Thailand. This peace, which also included an economic agreement with Japan, became definitive on May 9. In July the Japanese exerted great pressure for further concessions in French Indo-China, and on July 21 the Vichy government acceded to the Japanese demands, the military clauses of which evidently allowed large Japanese garrisons in eight new bases in the southern part of Indo-China and Japanese use of the naval base at Cam Ranh bay. In addition, beginning in June, the British and Free French kept French Somaliland in a state of blockade, with precarious communications open only by air.

Late April and early May marked the high point of "collaboration" in 1941, as a result of which it seemed for a time that

France might join the axis. The League of Nations was informed on April 19 of France's withdrawal. On May 11 Darlan had an interview with Hitler at Berchtesgaden. There were persistent rumours, soon proved to be true, that German airmen were using Syrian airfields en route to Iraq. On May 15 Pres. Roosevelt voiced his concern over the policy of "collaboration," and on the same day U.S. coast guards began to guard the French vessels, including the "Normandie," laid up in U.S. ports. Admiral Darlan was evidently convinced that the Germans would win the war, and on May 23, in a radio broadcast, he praised the policy of "collaboration" and Hitler's "new order," although he declared that France would not give up its colonies or its fleet. On May 28 Pétain reviewed recommissioned French planes at Aulnat, and it was understood that the Germans were permitting the French to send planes to Tunisia and Syria, which constituted a modification of the armistice terms.

This threatening international crisis died down because the Germans chose not to figure prominently in the Syrian campaign against the British and the Free French. Moreover, Gen. Weygand, who visited Vichy on June 2, is said to have disagreed sharply with Darlan about letting the Germans use military facilities in Syria. In the meantime the British and Free French invaded Syria on June 8; the Vichy French, under the command of High Commissioner Gen. Henri Fernand Dentz (*q.v.*), were unable to obtain sufficient re-enforcements for a long campaign, and, after severe fighting, an armistice was initialled at Acre on July 12. The occupying authorities permitted all Frenchmen in Syria to opt for repatriation, if they chose. Officially, the Vichy government did not recognize that it had voided any of its rights in this mandated territory, and Gen. Dentz, who was repatriated, still bore the official title of high commissioner at the end of 1941.

On June 30 the Vichy government broke off diplomatic relations with the U.S.S.R., and later tolerated, in the unoccupied zone, recruiting for the Legion of French Volunteers Against Bolshevism. War on the soviet union was not, however, declared in 1941, and it was particularly remarkable that France was not a signatory to the renewed and expanded anti-Comintern pact which was signed with much fanfare at Berlin on Nov. 25.

The title of "French Republic" was dropped from the masthead of the *Journal Officiel* on Jan. 4, 1941, and Pétain, throughout the year groped tentatively toward the "hierarchical and authoritarian" state he announced as his goal on June 4. The reorganization, in conformity with the slogan "Work, Family, Fatherland," proceeded slowly and piecemeal, partly because of financial and administrative difficulties, partly (it may be suspected) because of covert opposition and resistance. On Jan. 24 Pétain announced the membership of a consultative national council, composed of 188 members, of whom only 27 were former senators and 41 former deputies. On March 14 old-age pensions were announced, and on April 9 it was decreed that no divorce might be obtained within three years of the date of marriage. On April 18 a long-range plan was announced for grouping the infinitesimal landstrips of peasants into unified and more arable holdings, with the ultimate intention of persuading peasants to leave the villages and live on farmsteads. The government contemplated dividing the country into regional administrative units, controlling but not completely superseding the departments. A beginning was made in the free zone on April 12, "to improve the distribution of supplies." At Vichy on July 8 Pétain opened the sessions of that commission of the national council whose function it was to prepare a constitution for "an authoritarian, hierarchical, social state." He instructed the commission to make universal suffrage give place to a form of hierarchical group representation. By Oct. 23 the commission had finished its work, but its recommendations had not been published at the end of the year.

PARISIAN BREADLINES grew longer in 1941

The government was also moving slowly toward reorganizing the nation's economy along corporative lines in 1941. An elaborate banking law of July 6 put all French banks under the direction of a "professional committee." On Oct. 27 the long-awaited Labour Charter was published. Lock-outs and strikes were prohibited; although labour unions were not abolished, they were to be restricted within a single profession or industry, and no political or confessional activity was to be permitted.

Marshal Pétain in his broadcast of Aug. 12 took cognizance of the growing discontent and unrest by admitting that "an ill wind was blowing over France," and reminded his people that "the only authority is that which I entrust or delegate." The repercussions of the German campaign in the U.S.S.R. were partly the cause of this unrest, as was also the sensation aroused by the assassination on July 26 at Montelimar of Marx Dormoy, who had been minister of the interior in Leon Blum's Popular Front government. The perpetrators of this crime were not certainly identified to the public. The populace is said also to have been restive over the concessions to the Japanese in Indo-China, while in early August there was once again heavy German pressure for more "collaboration." In his broadcast of Aug. 12, Pétain announced that salaries for senators and deputies would be discontinued on Sept. 30 (this date was subsequently extended to June 2, 1942); that Freemasons would no longer be permitted to exercise public functions; and that the French Legion of War Veterans was to be expanded, apparently in order to form party backing for the Pétain regime. On Aug. 16 was published constitutional act no. IX, which required the army and all magistrates to take an oath of fealty to the chief of state. On Aug. 31, Pétain announced that membership in the French legion would thenceforth be extended to all who were ready to "volunteer their services for the National Revolution," and to the legion was accorded the privilege of claiming for its members two-thirds of any newly created governmental posts. The legion, which was said to number 1,200,000 in 1941, was not, however, authorized in the occupied zone.

Widespread sabotage, and even riots and attacks upon German soldiers, began to occur in the occupied zone in August. On Aug. 23 the Vichy government created special courts to deal summarily with terrorists and saboteurs, in order to prove to the Germans that the French were able to handle the situation them-

selves. On Aug. 27 Pierre Laval and Marcel Déat, the latter a leading "collaborationist" journalist, were wounded while attending a review at Versailles of the Legion of French Volunteers Against Bolshevism. On Oct. 20 Lieut.-Col. Paul Friedrich Hotz was assassinated at Nantes, and the next day Major Hans Gottfried Reimers was killed at Bordeaux. In retaliation, the Germans shot 50 hostages on Oct. 22, and another 50 on Oct. 24. It is said that Pétain desired to offer himself as a hostage; certainly both he and also Gen. de Gaulle (*q.v.*) appealed to the French to abstain from further attacks. Sabotage and attacks flared up again in late November and sporadically throughout December. There were several bomb explosions in Paris, and the Germans announced on Dec. 13 that another 100 hostages had been shot, although it is not certain that these executions really occurred. At all events, the French government on Dec. 14 officially protested against these hostage-killings. The official count of Frenchmen known to be executed by the Germans up to Dec. 13 was 205.

A "collaboration" crisis in November was marked by the retirement of Weygand on Nov. 20. This crisis was climaxed by the meetings of Pétain with Goering at Saint-Florentin on Dec. 1, and of Darlan with Ciano at Turin on Dec. 9–10, but the consequences of these conferences had not become apparent as the year came to an end.

The immediate effect of the entry of the U.S. into the war seems to have been to render both Vichy and Washington cautious about taking brash action—so much so that as the year came to a close still another Franco-German crisis over "collaboration" was clearly impending.

U.S. Ambassador Admiral W. D. Leahy, who arrived in Vichy on Jan. 6, 1941, evidently endeavoured constantly to encourage the government to resist complete "collaboration." On Dec. 12 the U.S. took possession of the 14 French vessels, including the "Normandie," which were laid up in U.S. harbours, an act which French Ambassador Henry-Haye formally protested. On Dec. 19 it was announced in Washington that a naval agreement had been signed by U.S. Admiral Frederick J. Horne and High Commissioner Admiral Georges Robert, whereby the continuation of Vichy control in Martinique and Guadeloupe was guaranteed in return for a renewed pledge that those islands would remain neutral. On Dec. 25 the U.S. state department vigorously protested against the Free French seizure of St. Pierre and Miquelon.

The trial of the "war-guilt" prisoners, Daladier, Gamelin and Blum, was from time to time postponed, and as the year ended a date in late Feb. 1942 was being mentioned.

Education.—Emphasis was put upon religious instruction. On Feb. 26, 1941, a law was decreed requiring all schools to provide this instruction, although it was to be optional for the students. State funds were created for church schools, which in return were to be subject to some limited and strictly defined state inspection. Training colleges for teachers were abolished. On Feb. 8 it was decreed that all French youths must serve for eight months in work camps upon reaching military age. Tuition fees were established for all secondary schools, albeit with the provision of liberal scholarships.

Finance.—The budget for 1941 called for ordinary expenditures of 97,000,000,000 francs, plus extraordinary ones (for public works and the liquidation of war costs) of 37,234,000,000 francs. The estimated receipts were 68,200,000,000 francs, leaving a deficit (exclusive of the costs of occupation) of 66,000,000,000 francs. Some savings were made by the conversion of bond issues, for the outstanding financial feature of the year was the abundance of funds available for investment, because of the disruption of industrial conditions and the consequent decline in rates of interest.

In 1940 temporary economic accords and clearing agreements were concluded with Germany and Switzerland. Similar agreements were concluded with Belgium on Jan. 11, 1941, with the Netherlands on Feb. 15, with Italy on Feb. 18 and with Norway on Nov. 11. Such agreements were also discussed with Hungary, Rumania and Spain. Most of these financial arrangements are tied to the German mark and cleared through Germany.

Communication.—Some progress had been made by the end of 1941 in construction and reconstruction. Almost all the damaged railroad lines and canals had been repaired. On March 15, the construction of the Trans-Saharan railroad was authorized, and on Sept. 5 there was appropriated 128,000,000 francs for this purpose, as well as for the defense of Dakar and the construction of harbour works at Abidjan (Ivory Coast).

Economic Conditions.—Unemployment, which stood at 700,000 in Jan. 1941, was only 235,000 in September, although this problem would be greatly aggravated if and when French war prisoners were released. On July 23 many French industries began operating on a 48-hour week, instead of the former 40-hour week. Probably as many as 100,000 French workers had accepted jobs in Germany, and many French industries were undoubtedly being supplied with raw materials by the Germans for the production of German war supplies, notably tanks, planes and parachutes. The government was trying hard to keep down the rising cost of living and to avoid disastrous inflation. A subsidy of 1,500,000,000 francs was allotted in 1941 to reduce the cost of bread, and this sum was doubled for 1942.

The greatest problem was that of supplies and their distribution. Adequate transportation was an almost insoluble problem because of shortages of rolling stock, lubricants and fuel. Production of coal in 1941 was officially estimated at 2,800,000 tons, compared with 4,500,000 in 1940. In order to conserve fuel, a shutdown of all but the most essential industries from Dec. 21, 1941, to Jan. 14, 1942, was decreed. Shortages of food were universal, and the results of undernourishment were already clearly discernible. Crops were below average in 1941, and the yield of wine was particularly poor.

Various steps were taken to reduce the consumption of alcoholic beverages, and the government also made extraordinary efforts, with only partial success, to prevent food profiteering in the "black markets," and to secure an equable division, through elaborate price fixing, of the scanty supply of fuel and foodstuffs. The increase of bureaucratic regulations was noteworthy in 1941, and it is said that in the eight months preceding July 12, 1941, Pétain signed 700 laws and 500 decrees. Franco, Francisco (1892–), Spanish soldier and statesman, was born in Galicia. After military service in Morocco, he became a colonel in 1926, and served under the Spanish republic of 1931 in the Balearic Islands, being later transferred to Morocco again. In 1935, he was made chief of staff. On the outbreak of the civil war in June 1936, he flew to Tetuan, in Spanish Morocco, and there organized the transport of Foreign Legionaries and Moorish troops to the Spanish mainland, whither he soon followed. Upon the death of Gen. Sanjurjo, Gen. Franco became military leader of the insurgents. After his victorious conclusion of the civil war in 1939 he added the title of prime minister to the others he possessed, organized his cabinet, and began the task of reconstruction. Franco issued a declaration of "strictest neutrality" at the outset of war in Sept. 1939, but the possibility of Spain's entry into the conflict after the French defeat was the cause for much speculation during the last half of 1940 and throughout 1941. His conference of Feb. 12, 1941, with Mussolini at Bordighera produced nothing tangible except the usual expression of "identity of views on all points." Internal problems continued to dog the *caudillo* throughout 1941. On May 9 there was a general shake-up in the government and the national police chief was ousted; later that month Franco delegated to the Falange (fascist) party complete control over the Spanish press. The problem of food remained acute, and Franco saw fit on July 17 to denounce the United States for refusing to ship grain to Spain. In August a report from Berne stated that an unsuccessful attempt had been made to assassinate Franco. At the end of the year Spain was still in the ever-diminishing neutral camp, Franco having signed a decree on Dec. 19 which proclaimed Spain's nonbelligerent status in the Pacific war. (*See* also SPAIN.)

Frazer, Sir James George (1854–1941), British anthropologist and author of *The Golden Bough*, was born Jan. 1 at Glasgow. He was recognized as one of the world's foremost authorities on folklore. (See *Encyclopædia Britannica.*)

His last work, published in four volumes, was *Anthologia Anthropologica, a Selection of Passages for the Study of Social Anthropology* (1938–39), and comprised studies on Africa, Madagascar, Australasia, Asia, Europe and America. Among his other late works were: *Myths of the Origin of Fire* (1930); *Garnered Sheaves* (1931); *The Fear of the Dead in Primitive Religion*, 3 vols. (1933–36) and *Aftermath* (1936). With his wife, the

former Mrs. Lilly Grove, he wrote several children's books, including *Pasha the Pom* (1937). Sir James died in Cambridge, England, May 7; Lady Frazer died 12 hours later.

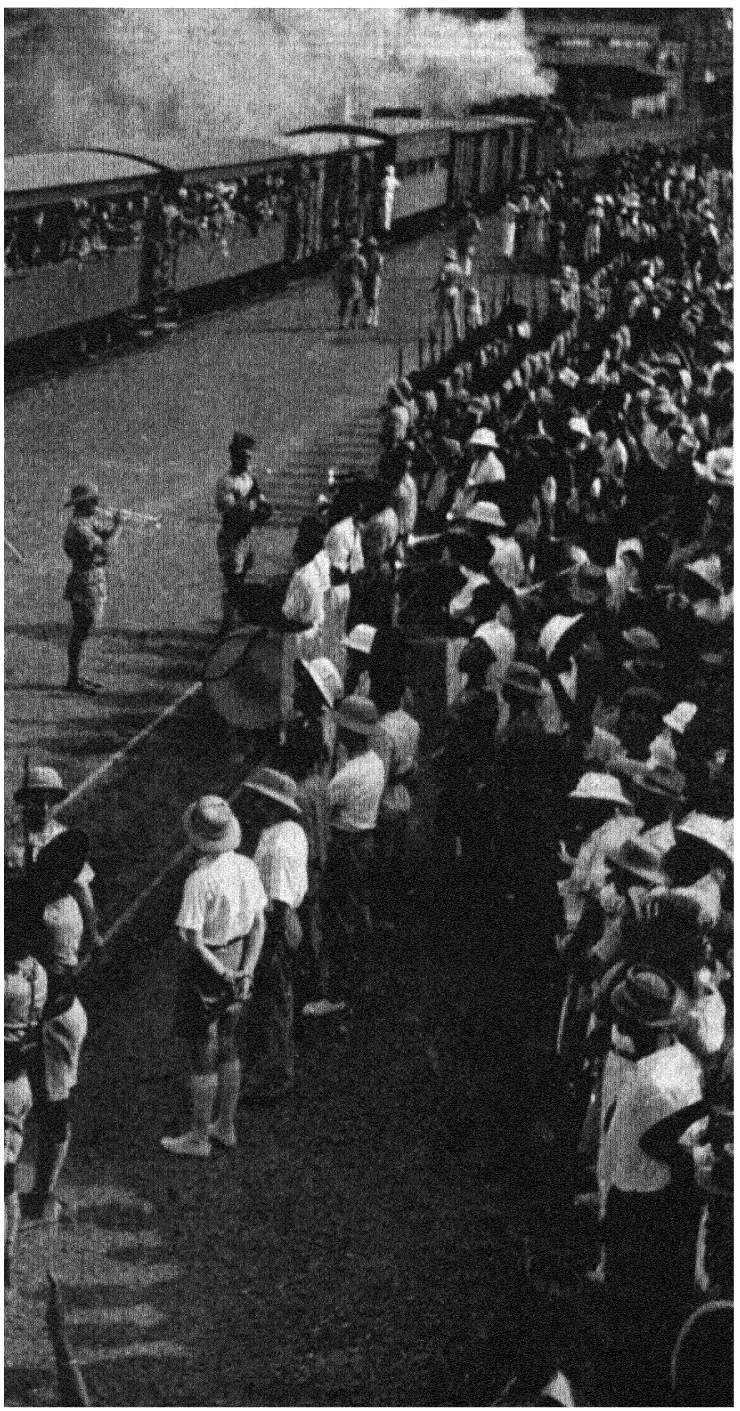
French Colonial Empire.

Total area (approx.) 4,657,000 sq.mi.; total pop. (est. Dec. 31, 1937) 70,147,000. Certain essential information on the French colonies, protectorates and mandates is given in the accompanying table.

History.—On Jan. 6, 1941, the public was informed of the letter by which the British government recognized the Council of Defense of the French empire established by two decrees of General Charles de Gaulle (*q.v.*), issued at Brazzaville Oct. 27, 1940. In that letter the British government informed General de Gaulle that it would be happy to treat with him and with the Council of Defense on all military, political and economic questions involving collaboration with the French overseas territories under the authority of General de Gaulle. Several commercial and financial agreements were subsequently signed by the British government and General de Gaulle as leader of the Free French and on behalf of the Council of Defense of the French empire. As a result of these agreements the Free French colonies were being restored to their former prosperity. The colonial budgets were again balanced, and provision was made for their contribution to the war effort. Credits were also granted for extensive public works.



PART OF THESE AFRICAN TROOPS shown leaving Duala in the Cameroons formed the Free French army which stormed into southern Libya and captured the Italian garrison of Murzuk in Jan. 1941

The first Free French airline began operations in Oct. 1941, linking Brazzaville to Cairo and Syria. One of the most powerful broadcasting stations in the world was set up in Free French Africa. The Cadets' school at the Camp Colonna d'Ornano, inaugurated Feb. 23, 1941, was often referred to as the "Saint Cyr" of the Free French empire. Research on sleeping sickness was carried on at the Institut Pasteur in Brazzaville.

Relations were also systematically developed between the Free French colonies and the United States of America. Chrome, nickel, lead, tin and rutile were exported to U.S. factories engaged in war work. An open general licence was granted for U.S. exports to the Free French colonies. A U.S. mission headed by Col. Cunningham was sent to Free French Africa, and the United States government appointed consuls in Nouméa and Tahiti.

During 1941, several changes took place in the administration of the Free French empire. In the national committee set up by General de Gaulle on Sept. 24, colonial questions were delegated to the commissariat for economy, finance and the colonies. General Sicé was appointed high commissioner for Free French Africa in August, replacing General de Larminat, who was nominated assistant to the commander in chief in the Levant, General Catroux. Post-Captain Thierry d'Argenlieu was appointed French high commissioner for the Pacific in July, and was given the task of making military preparations in order to counter any move made by Japan in that direction.

As to French Indo-China, which still owed allegiance to the Vichy government, it had been unable to prevent Japan from gaining a strong foothold there—a foothold the Japs used to launch their attack on Malaya in December. Thailand's aggressive move against Cambodia at the end of 1940 had the moral support of Japan, which acted as mediator during the long and difficult negotiations resulting in the peace treaty signed May 9. At the same time, on May 6, French Indo-China, which had experienced a regime of customs autonomy since the end of 1940, entered into an agreement of economic co-operation with Japan, which thus acquired an overwhelming influence in the economic life of the colony. On July 29, the French government was forced to sign a protocol providing for the joint defense with Japan of Indo-China. This gave Japan the right to use certain airfields and station troops in French Indo-China, thus facilitating attacks, after the surrender of Thailand, on Burma and Malaya, as well as south China and the strategic Burma road.

Certain portions of the French colonial empire still adhering to the Vichy government in 1941 were able to obtain food supplies under agreements signed with the United States. By terms of these agreements a fixed amount of the French treasury credits in the United States was unfrozen and paid into a special account, which was supervised by the U.S. treasury. It was thus impossible to divert the funds from the appropriation previously agreed upon between the treasury and the French representatives. Each colony coming under this scheme, *e.g.*, the French West Indies, Madagascar, and French Indo-China, was allowed a certain

†Syria and Lebanon were recognized by Great Britain and Free France as independent republics in Sept. and Nov. 1941 (*see* Syria and Lebanon).

quota. The funds were used in payment of purchases made in the United States or elsewhere in the western hemisphere. The goods so imported could not be re-exported either to France or to another colony.

French North Africa was originally the subject of a similar scheme, the execution of which depended upon navicerts issued by Great Britain. After the dismissal of General Maxime Weygand (*q.v.*) as delegate of the French government in French North Africa in Nov. 1941, however, the United States government ceased to send supplies to French North Africa. (*See* also Syria and Lebanon; World War II.) (X.)

French Colonies in America.—In 1941 the political position of the four colonies continued unchanged until December. In the first 11 months, attention was focused mainly on Martinique and, to a less extent, on French Guiana, especially after arrival of United States troops in adjacent Surinam. (See Surinam.) French naval units were kept under close surveillance by United States naval and air patrols. Both Martinique and Guadeloupe remained under semiblockade, with most of their external trade confined to the United States. On several occasions during the year, as the Vichy government seemed to turn more toward the axis, official and semiofficial statements were made in the United States regarding possible United States occupation of Martinique. With formal entry of the United States into World War II, fears that Martinique would become an axis base against the Americas were heightened. On Dec. 18, however, it was officially announced at Washington that an accord had been reached with Admiral Georges Robert, high commissioner for the French colonies in the western hemisphere. This agreement, it was understood, provided for continued trade with the United States in return for pledges that neither French vessels nor nationals would take any action detrimental to the United States. The Vichy government, however, denied any change in the status of the French American colonies. French Guiana reputedly was serving as an entrepôt for axis agents into South America in 1941.

The most critical international crisis, however, developed at St. Pierre and Miquelon. Throughout the year, the Vichy-appointed governor of that colony was harassed by intermittent undercover Free French agitation. On the night of Dec. 24, a Free French armed vessel seized St. Pierre. This move brought swift condemnation from the United States as a violation of agreements with the Vichy government, and a formal demand for restoration of the *status quo ante,* in spite of a plebiscite which showed an overwhelming Free French sentiment. As the year ended, a *modus vivendi* was reported in the making, under which Vichy control would be restored, with, however, a close supervision of the St. Pierre radio station (established under the Vichy government), whose weather reports were calculated to give aid to the enemy.

Finance.—The monetary unit is the French franc (=2.083 cents, Jan.–June 1940).

Trade.—In 1940 total St. Pierre and Miquelon imports were 28,614,000 fr. in value (1939, 28,735,000 fr.); exports, 16,475,000 fr. (1939, 18,010,000 fr.). Ship stores represented 72.9% of all exports (1939, 43.8%). After the collapse of France, the United States and Canada supplied nearly all imports. The former furnished $124,600 value in 1940 (1939, $141,980), and took $57,920 of exports (1939, $93,723). Imports of all the colonies are chiefly foodstuffs and miscellaneous manufactured goods. In 1940 Guadeloupe and Martinique together imported from the United States $2,221,698 in value (54% increase), and exported $175,749 (a 10% rise); French Guiana took $196,411, a 116% increase, and exported $26,541 value (a 25.4% decline). In the first eight months of 1941 Guadeloupe and Martinique imports from the United States increased 158% over 1940, to $3,223,401, and exports rose 207% to $224,345. French Guiana imports from the United States increased 49% to $114,894; exports remained stationary at $20,779. The unbalance of trade was settled from French funds "frozen" in the United States.

Communications.—Normally, the French American colonies have adequate external communication by sea. Guadeloupe, Martinique and French Guiana are on main Pan American Airways routes. Guadeloupe and Martinique have adequate highway systems. French Guiana has 250 km. of highway and 12 km. of railway, but in the interior, transport services are primitive.

Resources.—St. Pierre and Miquelon depend entirely on fishing, Guadeloupe and Martinique on agriculture (sugar especially, and bananas, with coffee and cacao in Guadeloupe), French Guiana on gold mining, cabinet woods and miscellaneous products of tropical agriculture. Martinique and Guadeloupe produce from 55,000 to 60,000 tons of sugar and 16,000,000 litres of rum annually. (L. W. Bz.)

French Literature.

After the nazi invasion of June 1940, literary activity in France was paralyzed, and it was only in 1941 that the creative forces began to revive. The fact that the country was split in two, and also that the free elements rallied around Gen. de Gaulle (*q.v.*) dominated the general picture.

In metropolitan France, literature marked a more or less sterile period. Paris publishers brought out only such works as met favour with the "collaborationist" dicta, and even in the so-called "free zone"—in Lyons, Marseilles, Clermont-Ferrand—where the occupying control was less oppressive, the official adherence to "collaboration" with the invader did not fail to shackle both writers and publishers. Certain younger poets and littérateurs issued their works in French North Africa, principally in Algiers. For the first time in France's long, brilliant history many of its important new literary works came from the French Diaspora. A new and vital phase began, one in which exiled writers, editors and publishers brought out significant creations from the strongholds of the democracies: London, New York, Montreal, Buenos Aires, Rio de Janeiro.

Many of the great Paris publishing houses resumed business, although, of course, under the restrictions imposed by nazi regime. The famous house of Gallimard (*Editions de la Nouvelle Revue Française*) was entirely in the hands of nazi sympathizers. Marcel Jouhandeau, who announced himself before the war as a militant anti-Semite, published in 1941 *L'Arbre de Visages, Chaminadour III.* Other books published by this house included: *Vie d'Alphonse Daudet,* by Lucien Daudet; *Iles de Beauté,* by Alain Gerbault; *L'Année Cruciale (1789),* by Frédéric Braesch; *Les Causes Perdues,* by V. Tréfusis; *Vie de Mallarmé,* by Henri Mondor; *Rayonnement de Lyautey,* by Patrick Heidsick. Bernard Grasset, another convert to the cause of the invader, returned to Paris to reorganize his publishing house. He issued novels by Henry de Montherlant, François Mauriac and others. The house of Stock carried on with such books as *Sur Une Terre Menacée,* by Marcel Arland; *Les Contes de Poindi,* by Jean Mariotti; *Le Grand Passage,* translated from the English of Kenneth Roberts. The house of Plon published in 1941 *La Légion des Vivants,* a novel of the far east, translated from the English of O. P. Gilbert. Denoël brought out *Histoire de la Maison de Savoie,* by Fernand Hayward; and the *Editions de France* published *La Cantinère de Napoléon,* by Robert Burnand. From the *Presses Universitaires de France* came *La Mort et Ses Problèmes* by Henri Bon.

Louis-Ferdinand Céline, who gained notoriety with his *Voyage au Bout de la Nuit,* a few years before, appeared with a new volume, *Les Beaux Draps,* in which his anti-Semitism is only equalled in violence and ordure by his hatred of his country's effort. Georges Duhamel, in Paris, had his new novel *Lieux d'Asile* banned, at the moment of publication, by the Paris gestapo.

The treachery and hypocrisy of the Germanophile spirit in Paris was only too manifest. The well-known monthly, *Nouvelle Revue Française,* which flourished under the liberal editorship of Jean Paulhan before the war, was in 1941 in the hands of a nazi sympathizer, the poet and novelist, Drieu la Rochelle. André Gide, the original founder of the magazine, withdrew, after an excerpt from his diary was published without his permission. The chief collaborators were: Marcel Jouhandeau and Robert Brasillac. Brasillac, taken prisoner in the surrender of June 1940, was released by the Germans and was in 1941 an active "collaborationist." Another militant pro-nazi in 1941 was Jean Luchaire, whose *Nouveaux Temps* was reaping the fruit of prewar Hitlerite activities.

More reassuring was the news that Adrienne Monnier, publisher of the French version of James Joyce's *Ulysses,* around whose bookshop since World War I had been centred all that was most interesting in French literary life, was still pursuing her independent career. During the year, to mark the 25th anniversary of the founding of her "librairie," such distinguished men as Léon-Paul Fargue, Daniél Hálévy, Francis Poulenc, the composer, Paul Valéry and others met together in the little backroom of the Rue de l'Odéon shop. Paul Valéry, on that occasion, read fragments from his new work, *Faust.*

The persecution of liberal writers continued. Jean Wahl, the philosopher, was arrested and put in a concentration camp. It was rumoured that Julien Benda was also sought by the gestapo. André Gide was prevented by the police of Nice from speaking on his chosen subject of the poetry of Henry Michaux.

In the "free zone," Marseilles offered a semitotalitarian atmosphere. The magazine, *Cahiers du Sud,* continued to appear there under the direction of Jean Ballard who offered a haven to a number of the younger men, poets and novelists. *La Revue des Deux Mondes* continued to publish conformist articles by Henry Bordeaux, F. Charles Roux, André Chaumeix, Maurice Genevoix. Charles Maurras, editor of *Action Française,* who was the royalist power behind the throne of Vichy, was a regular contributor to the *Revue Universelle,* which also published Jacques Delebècque. The voice of his former associate, Léon Daudet, was in 1941 silent. Another review, *La Cité Nouvelle,* with contributions by André Desqueyrat and Guy Chastel, had a strictly official direction.

The publisher H. Lardanchet brought out in Lyons *Les Idées Restent,* by Henri Massis, a popular potpourri of reactionary ideas; *Le Troisième Richelieu,* by J. Fouques Duparc; *Le Solliloque de Maurice Barrès,* by René Benjamin; and a novel, *Le Diable à l'Hôtel,* by Emile Henriot. Paul Claudel, the Gothic-Baroque poet, playwright and critic, revealed himself once more in 1941 as a master of prose in his *Présence et Prophétie,* published by the University of Fribourg Editions in Switzerland.

Georges Bernanos, the novelist, who lives in Rio de Janeiro, published *Lettre aux Anglais.* In Buenos Aires, Roger Caillois, a lycée professor, and former member of the Collège de Sociologie in Paris, brought out the first numbers of *Lettres Françaises,* the only exclusively Free French literary review in South America. It was published under the protection of the well-known Argentine review, *Sur,* which also sponsored the regular appearance of French books and pamphlets, such as: *Le Roman Policier,* by Roger Caillois; *Petite Stèle pour Joyce,* by Louis Gillet; *Actualités de La Fontaine,* by Paul Hazard.

The most intense activity in the publication of exile French books in 1941 was to be found in New York and Montreal. *La Maison Française* in New York city began with the publication of a great trio: André Maurois, Jules Romains, Jacques Maritain. It soon branched out. Many other exiled French writers began to appear: André Morize, Robert de Saint Jean, Julien Green, Pierre de Lanux, Geneviève Tabouis, Max Beer, Richard Lewinson, Claire Goll, Robert Goffin, Maurice Coindreau, as well as numerous translations. The *French Forum,* a review issued since 1939, under the editorship of Dr. Henri Barzun, also counted among the activities of the *Editions de la Maison Française.* Also, in New York, Brentano's brought out distinguished French books, signed by such well-known names as Philippe Barrès (on General de Gaulle), Henry Torrès, Roger Secrétain, Michelle Le Normand. In Montreal, the *Edition de l'Arbre* rallied a number of leading French writers with metaphysical tendencies, such as Jacques Maritain, René Schwob, Marie-Alain Couturier, who published, respectively: *Crépuscule de la Civilization, Cinq Mystères en Forme de Retable, Art et Catholicisme. La Relève,* a Catholic review, having among its contributors such writers as Daniel-Rops, Robert Charbonneau, Comte Sforza, began publication in Montreal.

The arrival in the United States during the spring of 1941 of André Breton marked the official transplantation of *Surréalisme* from France to the western hemisphere. Breton's last book, *Humour Noir,* published by Kra in Marseilles shortly after the armistice, was banned by the Vichy authorities. In an interview with him published in a Surrealist number of the American poetry journal *View,* Breton announced his plans to write a *Third Surrealist Manifesto.* (E. Js.)

Frew, Walter Edwin

(1864–1941), U.S. banker, was born July 18 in Brooklyn, N.Y. At the age of 15 he started work as an office boy in a brokerage firm; at 31 he was president of the Queens County bank in Long Island City, Queens; and at 47 he was elected president of the Corn Exchange bank, one of the largest financial institutions in the United States. He was a member of the federal advisory committee of the Federal Reserve Bank of New York and was also a director of many corporations. In May 1929, when the Corn Exchange became a trust company, Frew resigned as president and became chairman of the board of the new institution. He died at his home in New York city, May 19.

Friends, Religious Society of.

The Religious Society of Friends has a membership of 164,209, representing 30 countries and comprising 54 yearly meetings and annual conference groups. In the United States and Canada there were in 1941, 29 yearly meetings with a

membership of 115,201. The Friends general conference is an association of six of these yearly meetings and the regular biennial conference was scheduled to be held at Cape May, N.J., in July 1942. The Five Years meeting with headquarters in Richmond, Ind., is an association of 11 yearly meetings which gathered for their last quinquennial conference in 1940.

The Friends World Committee for Consultation, composed of one representative and alternate from each of the 54 yearly meetings, was established in 1937 and is divided into a European section, American section and oriental section. The European section represents the Friends' groups in Denmark, France, Germany, Great Britain, Ireland, Netherlands, Norway, Czechoslovakia, Sweden and Switzerland. The oriental section draws together Friends in Africa, Pemba, Madagascar, China, India, Japan, Palestine, Syria, New Zealand and Australia. The American section includes Alaska, Cuba, Jamaica, Mexico, Honduras and Guatemala, besides the United States and Canada.

In the United States in 1941 there were 40 elementary and high schools directed by Friends, and there were 13 colleges under Friends' care. More than 150 schools of various natures were conducted throughout the world by Friends in 1941. There were more than 50 Friends' periodicals and more than 40 Friends' centres representing the Society of Friends.

The Religious Society of Friends is a spiritual movement based upon an experimental way of life which recognizes the imminence of God, the sacredness of human personality and the power of nonviolence as expressed in simple, straightforward, honest living. The society has borne a peace testimony for 300 years and seeks to make its pacifist ideals real by means of creative social action which is positive and constructive. Its program of social action is carried out by the American Friends Service committee in America and the Friends Service council in England co-operating in a program of child feeding, assistance to refugees, social-industrial rehabilitation, peace education and civilian public service.

During the summer of 1941 the social-industrial section conducted 17 summer work camps, with 312 university students participating. In these work camps, in areas of social conflict, the students helped construct playgrounds, swimming pools, recreation centres, improved buildings in a share-cropper community and worked on roads, parks and dams in co-operative communities.

Conscientious Objectors.—Civilian public service was organized during 1941 to provide a means of service for conscientious objectors who were released by the National Selective Service for work of nonmilitary nature. In co-operation with the Mennonites and the Church of the Brethren, 18 camps were opened with approximately 1,200 men in all the camps. There were in 1941 about 450 men in the six camps operated by Friends. These men were engaged in such work as reforestation, soil conservation and general rehabilitation and public service. These camps were supported by the pacifist churches and were not under government control, but were subject to government inspection.

Social Service.—The peace section in 1941 undertook some projects of building good will south of the U.S. border. Twelve students helped build a brick schoolhouse in Puerto Rico. Eighteen women went to Torreón, Mexico, to work with the women and children on problems of health and recreational activities.

In Tuxpan, Mexico, the city almost totally destroyed by earthquake, there were 43 workers who helped clean the debris from the streets and rebuild the schoolhouses. In the United States a civilian training unit for women was conducted near Philadelphia, where 34 women prepared themselves for greater usefulness in the skills of gardening, social service and the study of dietetics.

Refugee service continued throughout the year and during the first six months more than 2,000 requests for service were received from people scattered over 45 different nations. Friends' centres of good will continued to befriend refugees in Geneva, Paris, Berlin, Vienna, Amsterdam and Stockholm.

Offices of assistance were also maintained in Marseilles, France; Lisbon, Portugal; Santo Domingo; and Shanghai, China. In the United States interview and placement services were extended through the refugee hostels and seminars—workshops in Iowa, New York, New Hampshire and Pennsylvania.

American Friends co-operated with British Friends in War Victims Relief service. Hostels for children and evacuées and service to blitzed cities with the assistance of the Friends ambulance unit indicate the nature of the service to the dispossessed. One ambulance unit with 40 men went to China by way of the Burma road.

Child feeding and relief continued in unoccupied France, where more than 50,000 school children were fed daily, 2,000 orphan children were gathered in colony homes, 1,000 babies received an extra ration of milk and vitamins. Clothing was collected and sent to England, France, China, Mexico, Santo Domingo, to the share croppers in southern U.S. and the migrant workers in western U.S.

The Five Years Meeting Board of Missions in 1941 conducted schools and hospitals in Palestine, Africa, Cuba, Mexico and Jamaica, and offered services to Tennessee mountain people and Oklahoma Indians. Mission schools were also conducted by Oregon and California Friends in Bolivia, Honduras, Guatemala and Alaska. The Wider Quaker Fellowship was established for persons who desire to have a closer fellowship with Friends while at the same time continuing their previous denominational affiliation.

Fuel Briquettes.

World production of fuel briquettes in 1938 was estimated at 64,834,000 metric tons, including 51,000,000 tons in Germany, 7,475,000 tons in France, 1,712,000 tons in Belgium, 1,323,000 tons in the Netherlands, 936,400 tons in the United States and 724,000 tons in Czechoslovakia. After 1938 no information was available except for some scattered data for 1939, and the output of the United States. Production of briquettes and package fuel in the United States had been increasing and in 1940 amounted to 1,335,387 short tons, of which 1,050,000 tons was briquettes, and 284,513 tons was package fuel, that is, briquettes wrapped in paper for convenience and cleanliness in handling. (G. A. Ro.)

Fuller's Earth.

Competition from other products and improvements leading to greater economy in its use have gradually cut the production of fuller's earth in the United States from 335,600 short tons in 1930 to 146,600 tons in 1940. In the same period imports declined from 7,800 tons to less than 500 tons. (G. A. Ro.)

Furniture Industry.

America's 2,300 household furniture factories enjoyed the greatest boom since World War I in 1941 when dollar volume gained 36% for an estimated total production of $620,000,000, just $39,000,000 below the 1929 all-time peak production of $659,000,000. The only comparable gain was in 1920 when production increased 75% to $500,000,000, due largely to a 60% increase in prices. Contrary to all expectations, even those of the National Furniture Manufacturers association, the last quarter shipments showed the

greatest gain for the year, instead of a loss, bringing the total production of wooden furniture for 1941 to $660,000,000, a gain of 40% over 1940 and the highest peak ever reached in the history of the industry, a gain of 8% over 1929, the previous best year.

Defense housing accounted for perhaps half of the industry's gain, and new home building, the greatest in American history, for the remainder. Replacement purchases have remained fairly steady after 1937.

To produce this larger volume required 135,000 employees, a gain of 12% and a 40% higher pay roll than in 1940. It also required 25% more lumber, finishing materials, steel, fabrics and miscellaneous supplies.

Despite the fact most factories were operating to the limit of their production facilities, the industry completed the year with its backlog of unfilled orders more than double that of 1940, averaging four months output, but was shipping 40% more goods (dollar volume) daily.

During 1941 approximately 50 additional furniture plants were established bringing the total to 2,300 of which 65% were located in 11 states: New York, North Carolina, Illinois, Pennsylvania, Michigan, Indiana, Virginia, Ohio, Massachusetts, Wisconsin and Oregon.

The principal woods used in 1941 were walnut, mahogany, maple, oak, Philippine woods and aspen. It appeared that in 1942 less mahogany and Philippine woods and more walnut, maple and oak would be used.

Defense needs in 1942 were expected to restrict metal furniture, furniture hardware, finishing materials and spring wire for upholstered furniture and bedding. But there was no shortage of domestic hardwoods and substitutes were expected to be used, such as rubber mattress and upholstery filling, while for finishes, the industry might return to varnish since lacquer was scarce in 1941.

Europe.—The furniture industry, except in England and Switzerland, was demoralized and practically extinct due to war. The 400 factories in occupied France were closed. The 100 in Vichy France were hard hit by economic conditions. Germany's 1,000 plants were unable to obtain either supplies or man power. Switzerland's 200 plants, mostly small, had lost most of their customers in other European lands. Belgium and Italy, both large producers before the war, were operating only to meet war requirements. England's 1,200 plants, mostly small, were in partial operation caring for domestic needs. The U.S.S.R.'s 500 factories were closed by war. Canada's 100 factories were enjoying their biggest boom. (J. A. G.)

Furs. For the first nine months of 1941 the American fur industry followed up the gains of 1940 by a further increase in the volume of its business. It enjoyed a strong consumer demand throughout the early months, the spring season and the summer. Production and retail sales were about 50% greater than for the corresponding nine months of 1940. Skin prices advanced rapidly in July and August. There was a boom in fur apparel sales in September. This stimulation in public purchasing of furs was due largely to the new 10% federal tax on the retail selling price of all fur apparel and fur-trimmed apparel (where the fur was the part of chief value). People purchased furs early in order to "beat the tax" effective Oct. 1. There was also the incentive to buy furs since it was believed that fur prices would advance steadily because of war conditions and the cutting off of importations of fur skins from foreign sources.

The fur industry was misled by the activity of the summer months and made the mistake of concluding that business would continue throughout the winter months at the same pace as in August and September. Too much confidence was placed in the creation of a new consumer group in the defense industries. Actually the business practically came to a stop by the end of October. The fur trade and the retail distributors of fur apparel found themselves in November overproduced, overstocked and overextended. Unseasonably mild weather, the ever-growing threat of war and finally the attack on the United States by Japan in the Pacific on Dec. 7 gave the finishing touches to a disastrous three months for the American fur trade. Profits made by many firms during the first nine months were largely wiped out during the last three of 1941. The blow fell heaviest on the New York manufacturers and the east coast and west coast retail establishments. They ended the year with heavy stocks of fur garments, a large proportion of which was high-priced merchandise. Price cutting started before the end of December. Notwithstanding the slump in the final quarter of the year, it is estimated that more units were sold than in 1940 and the average of prices obtained was higher.

The United States imported an estimated $90,000,000 worth of furs in 1941 compared with $75,626,000 in 1940. Government import figures were available only for the nine months January to September ($76,213,687). Import figures were withheld after September as a war measure. Large quantities of furs came from Russia late in the year, following the break between the soviets and Germany.

Africa and Afghanistan again were the United States' greatest sources of supply for the favourite fur, Persian lamb. Imports were over 4,000,000 skins valued at $24,000,000, including the Russian shipments of Persians. Australia and New Zealand shipped most of the $15,000,000 worth of rabbitskins imported. China furs were received in reduced quantities and under great difficulties because of Japanese control over Chinese ports. Trade in European furs ceased, except for limited quantities of rabbitskins from England. The United States imported most of the Canadian 1940–41 fur production, estimated at about $16,000,000 in value. Imports of lambskins, nutria, guanaquito, hare, ocelot and other furs from the South Americas increased. Prices on all items were much higher by the summer of 1941 than at any time in 1940.

Exports dropped to about $4,000,000 compared with $11,236,000 in 1940.

The unexpected decline in consumer demand in the fall brought about a readjustment in the prices quoted on new crop raw American and Canadian furs. Prices opened from 15% to 50% above the levels of Nov. 1940. Country traders paid high prices early in the season only to find no buyers in the markets. Mink breeders found no buyers for their fine skins in December. There was no market for anything except silver fox, which was no higher in price than a year before. The condition continued throughout December.

The fur trade had no immediate need for skins. There was a large carry-over of mink, Persian lamb, muskrat (the three big furs of fashion). War conditions clouded the outlook. The year 1942 was obviously filled with uncertainty. Skin prices declined. By the end of December they were, with a few exceptions, on the same basis as in Dec. 1940.

Insolvencies in the fur industry totalled 83 for the 12-month period Dec. 1940 to Nov. 1941, according to the American Fur Merchants Association, Inc., New York. Of them 63 were in New York and losses were $1,354,184. Failures outside of New York were 20 representing losses of $302,171. Good recoveries were made in most instances. (During Dec. 1941 there were about thirty recorded insolvencies in the trade.)

The estimated production of the trade in 1941 was valued at about $200,000,000 wholesale. Retail valuation was impossible to

estimate because of the decline in consumer demand and the reductions in prices during the final quarter of the year.

Gandhi, Mohandas Karamchand (1869–), Hindu nationalist leader, was born at Porbandar (Kathiawar), India. For his biography, see *Encyclopædia Britannica*. On Jan. 22, 1937, Ghandi announced his retirement from active Indian politics, but by 1940 he was as prominent as ever in Indian affairs of state. The All-India congress on March 20, 1940, delegated to him the direction of negotiations with Great Britain for national independence. On Sept. 17, 1940, the congress committee elected Gandhi its leader by a vote of 192 to 7; only the communist members opposed him.

After a Christmas (1940) truce, Gandhi resumed his campaign of civil disobedience against British rule, despite pleas from London and from within the All-India congress itself. In April 1941 he announced that the congress had temporarily abandoned its aim of independence for India, but he reaffirmed his personal policy of nonviolence. On Dec. 30, after the congress had abandoned the civil-disobedience program also, Gandhi resigned from its leadership. (*See* also India.)

Gas, Natural. Total production of natural gas in the United States usually exceeds the marketed production by about one-third, somewhat more than half coming from gas wells, and less than half from oil wells. Losses and wastage run 20% to 25% of the total output, and up to 5% may be pumped back into the ground, either for storage or for repressuring the field. In 1940 the marketed production was 2,672,000,000,000 cu.ft., an increase of 8% over 1939; the producers used 700,000,000,000 cu.ft. for light, fuel and power in the producing field, domestic fuel used 442,000,000,000, commercial heating and lighting 132,000,000,000, the production of carbon black 369,000,000,000, electric power and public utility plants 183,000,000,000 and petroleum refineries 100,000,000,000; about 5,000,000,000 was exported, mostly to Mexico, and the remainder went to varied industrial uses not classified. Of the total, 17% was used for domestic, 5% for commercial and 78% for industrial uses.

When the peak load demand on a long gas transmission line exceeds the capacity of the line, it becomes a serious matter, involving the laying either of a new and larger line, or of a second line to supplement the capacity of the first. To handle this problem in Cleveland, there was built in 1940 the first large-scale plant for the liquefying of natural gas, the product of which can be stored in much less space and at correspondingly less cost than to provide storage for the gas itself. This plant liquefies and stores the surplus gas at periods of low demand, and in peak load periods the stored liquid is gasified and fed to the distribution system to supplement the normal capacity of the system. Although the plant was built primarily for this purpose, the problems involved in the storage and transportation of the liquid gas were being studied, with a view of broadening the field of use of the liquid gas.

About 90% of the natural gas output of the United States was treated to remove a small percentage of gasoline vapour, before it is piped away for use. In this way there was produced in 1940 some 2,320,000,000 gal. of natural gasoline, most of which is blended with the gasoline from crude petroleum refineries.

(G. A. Ro.)

Gasoline: *see* Petroleum.

Gaulle, Charles de (1890–), French soldier and leader of the forces of Free France after the armistices of June 22–24, 1940, graduated from St. Cyr military college at Paris shortly before the German invasion of France in 1914. Wounded three times during World War I, he was captured by German troops at Verdun in 1916, but escaped and saw further action on the western front and in the near east. Foreseeing the future tactical importance of tanks and combat cars, he waged a one-man campaign to persuade France to mechanize her infantry after 1918, but army officers preferred to place their trust in such measures of immobile defense as the Maginot line. The first several days of Germany's lightning thrust through Belgium and the Netherlands in May 1940 proved the correctness of de Gaulle's theories, and he was belatedly made undersecretary of war in Reynaud's cabinet. He parted ways with Marshal Pétain's government when it elected to surrender, and he fled to London. There on June 23, 1940, he announced formation of the French National committee, an expatriate military and political organization. Much of French Equatorial Africa, French Oceania, French India and Caledonia rallied to de Gaulle's banner despite the fact that the Vichy government had condemned him to death *in absentia* for treason. After an abortive attempt to capture Dakar, Senegal, with the support of British warships Sept. 23–25, 1940,

GEN. CHARLES DE GAULLE consolidated his African positions in 1941; he also added Syria and Lebanon, and St. Pierre and Miquelon to the banner of the Free French

de Gaulle landed troops at Libreville Nov. 9 and within three days had secured all of Gabun.

The year 1941 saw an expansion of de Gaulle's Free French movement—geographically by the addition of Syria and Lebanon (*q.v.*) July 12 and St. Pierre and Miquelon Dec. 24, militarily by additions to its army and navy; and politically by formation Sept. 23 of the Free French National council. De Gaulle named himself president of the council and appointed a regular cabinet.

In April 1941, de Gaulle left London for a five-month inspection tour of his provinces; he was present at the occupation of Syria and Lebanon and witnessed the beginning of the Iranian campaign in August. From London or from Brazzaville he issued many appeals to the Vichy French colonies to join him; he also pleaded with the citizens of occupied and unoccupied France to support his cause, or at least not hinder it. During the Germans' mass execution of French hostages in October he appealed to the French to discontinue violence and to remain inactive for five-minute periods instead as a protest against the slayings. In September, de Gaulle concluded a military and political alliance with the U.S.S.R.; in November he secured lend-lease aid from the United States for Free France; on Dec. 8 he announced that the Free French National council was at war with Japan.

Gehrig, Henry Louis (1903–1941), U.S. baseball player, was born in New York city, June 19. A husky youngster, he played baseball at Columbia university and found the game so absorbing that he left college for a tryout in 1923 with the New York Yankees. But he lacked experience and was sent to minor league teams for further seasoning. In 1925 he returned to the Yankees and, on June 2 of that year, the illness of the regular first baseman gave the "rookie" a chance to display his talents. Not only did Gehrig win a permanent job at first base, but for the next 14 years he played 2,130 consecutive games, setting a modern baseball record. In addition, he set 14 other season records and tied three others during his career, and was surpassed in hitting home runs only by George Herman (Babe) Ruth, a Yankee teammate. Gehrig's record for consecutive games won him the nickname of the "Iron Horse." But in 1939 he lost his speed and co-ordination and voluntarily ended his consecutive game record on April 30. A medical examination disclosed that Gehrig was suffering from a form of paralysis and he retired from baseball at the close of the 1939 season. In Oct. 1939 Mayor La Guardia of New York appointed Gehrig to the municipal parole commission, a move that was hailed enthusiastically because of Gehrig's reputation as a gentleman and sportsman. He continued in that position until his death at his home in the Bronx, N.Y., June 2.

Gems and Precious Stones. The United States is the world's leading market for gem stones of all kinds. Imports in 1940 are shown in the table.

U.S. Imports of Gem Stones, 1940

	Carats	Value
Diamonds: rough or uncut	227,886	$11,595,701
cut but not set	321,471	22,001,719
Emeralds: rough or uncut	14,364	6,015
cut but not set	16,093	304,104
Pearls: natural	..	224,101
cultivated	..	355,505
Other gem stones: rough or uncut	..	153,858
cut but not set	..	2,191,513
Imitation or synthetic gems	..	819,336
Marcasites: real	..	6,790
imitation	..	18,071
Total value	..	$37,767,705

This amount was a decrease of 7% from 1939, largely because of inability to secure the desired amounts of cut stones, both natural and synthetic, though this reduction was offset to some extent by increased imports of uncut stones.

The impact of war on the gem trade was considerable, involving as it did numerous and widespread regulatory decrees on importation, exportation, sale and taxation in all countries concerned in the transaction. Along with these, there was the widespread disorganization of the cutting industries in Belgium, Netherlands, France, Germany, Switzerland and Czechoslovakia. In spite of all of these difficulties, imports into the United States during the first eight months of 1941 had a total value of $20,960,828, an average rate 17% less than that of 1940. Genetics. In 1941 genetic studies on over 60 animal groups were published, with most attention given to the fruit-fly, *Drosophila,* man and poultry. In over 50 plant groups investigated, corn, cotton, tobacco and tomato led the list.

Human Genetics.—Ford and Mason reported that all of the Dionne quintuplets were "tasters" of phenylthiourea. Snyder, Baxter and Knisely found from a statistical study of 190 sibpairs that blood group, blood type and reaction to phenylthiocarbamide genes are not linked. Burks and Wyandt reported independent inheritance of sex, mid-digital hair and oval red blood cells and possible linkage of oval cells and the A-B agglutinogen factors. Haldane discovered that recessive spastic paraplegia is a partially sex-linked gene, carried in both X and Y chromosomes. He suggested that modifying genes may be responsible for the time of onset of certain hereditary diseases, such as Huntington's chorea. A concise and up-to-date Medical Genetics by L. H. Snyder presented clearly the role of heredity in human disease and discussed the possible application to medicine of research in human genetics.

Animal Genetics.—In the rat, Castle and King reported linkage of recessive anaemia to curly and brown and of wobbly gait to hairless, the latter case establishing a third linkage group. In poultry new mutants described were short upper beak by Landauer; polydactyly by Warren; dominant chalky shell by Taylor and Lerner; recessive microphthalmia by Jeffrey; and sex-linked imperfect albinism by Mueller and Hutt. Cooper for the first time observed spindle fibres in living material, using a mite egg for this study. White reported extensive work on the evolution of sex chromosomes in the Orthoptera. Many new cases of hybridization in the genus *Drosophila* were reported by Patterson, Sturtevant, Stone and others. After genetic and cytological comparison of *Drosophila* species, Sturtevant and Novitski concluded that during the evolution of this genus few translocations between chromosome elements have occurred. Philip Bridges published a cytological map of salivary chromosome III in *Drosophila melanogaster* showing over 2,000 bands. By urea-sodium hydroxide treatment Kodani demonstrated alternate regions of euchromatin and heterochromatin in salivary chromosomes of *Drosophila.* Helfer's work on breakage of chromosomes following X-raying established that natural chromosome inversions in *Drosophila pseudo-obscura* were not the result of pre-existing weak spots in the chromatin. Dempster and Kaufmann concluded independently by X-ray work on *Drosophila* sperm that no short time factor was involved between two breaks leading to chromosome aberration, as found by Sax in Tradescantia. Mueller's transfer of the fourth chromosome from *Drosophila simulans* to *Drosophila melanogaster* demonstrated interspecific sterility factors in this small chromosome.

Plant Genetics.—McClintock reported that some recessive mutants in corn are produced by small homozygous deficiencies. She found that broken ends of corn chromosomes could become stabilized. Anderson and Erickson suggested that "in hybrids between diverse parents, natural selection would tend to encourage those modifiers favouring one parental extreme or the other." They presented evidence that this theory of "antithetical dominance" might account for genetic peculiarities in corn, a plant of hybrid origin. Harland, Atteck and Silow published extensively on hybridization in cottons, dealing with the transfer of genes from one species to another and their expression in the new reaction system. The Meyer medal of the American Genetic association was presented to Dr. Navarro de Andrade for introduction of eucalyptus into Brazil.

Geographical Society, American: *see* AMERICAN GEOGRAPHICAL SOCIETY.

Geology. Geological publications were again restricted, particularly outside of the United States, because of the concentration of scientific endeavour on war activities. This situation was offset somewhat by many reports on strategic minerals. The federal and some of the state geological surveys were devoting much attention to these resources.

More attention was being given to college curricula in the training of geologists and geophysicists. At least two American mineral industry societies had committees working on this problem in an effort to standardize curricula.

History of Geology.—The fiftieth anniversary volume of the Geological Society of America, entitled *Geology, 1888–1938* represented a review of the development of the various branches of geology by many specialists, each an authority in his field. Inasmuch as the greatest development of geology took place during this period the volume was of noteworthy importance.

Physical Geology.—The interest in submarine canyons continued and several contributions were made on this subject.

Revisions of several standard textbooks on geology appeared. Notable among these were *Outlines of Physical Geology* by Longwell, Knopf and Flint and *Introduction to Physical Geology with Special Reference to North America* by Miller.

Part two of the *Reports of the Greenland Expedition of the University of Michigan* covering meteorology, physiography and botany under the editorship of Hobbs appeared.

Historical Geology.—A new edition of *Outlines of Historical Geology* by Schuchert and Dunbar was published. This had been combined with *Outlines of Physical Geology* by Longwell, Knopf and Flint to form the second edition of *Outlines of Geology*.

The fourth edition of the widely adopted *Textbook of Geology, Part Two: Historical Geology* by Schuchert and Dunbar represented a great improvement over the early editions.

The thought provoking book, *The Rhythm of the Ages* under the authorship of Grabau appeared in Peking in 1940. This is a synopsis of the four volume work entitled *Palaeozoic Formations in Light of the Pulsation Theory* (1936–39) and a further application of the theory to all younger geological formations.

The semi-popular work entitled *The Last Million Years* by Coleman, edited by Kay, constituted an important addition to the literature on Pleistocene geology.

Sedimentation.—The exhaustive work by De Geer, *Geochronologia Suecia Principles* which is a summary of the author's pioneer contributions on geochronology based on the study of varves represented an outstanding contribution for the year.

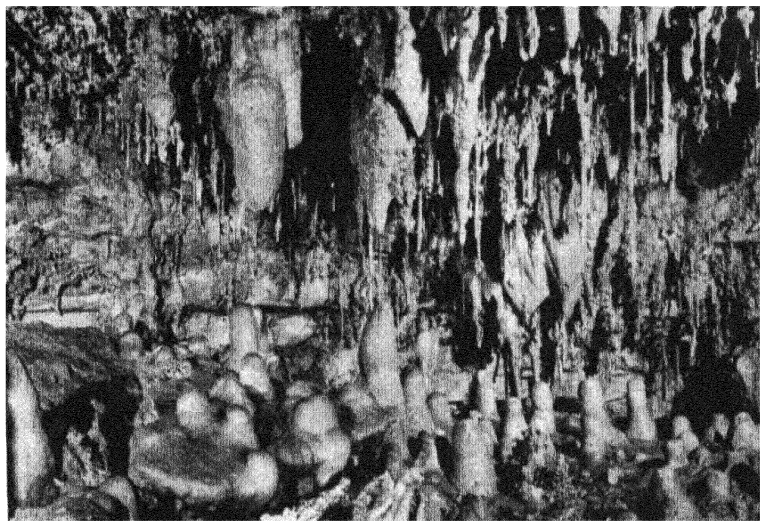
Technical Bulletin 695 of the United States department of agriculture, *Some Principles of Accelerated Stream and Valley Sedimentation* by Happ, Rittenhouse and Dobson was expected to serve as a model for future investigations on soil erosion.

Structural Geology.—*Outlines of Structural Geology* by Hills which came from the press in 1940 is a good summary of the modern conception of the fundamental principles of this subject.

The fourth edition of Lahee's *Field Geology* is a substantial improvement and enlargement of the earlier editions of this excellent handbook.

Petrology and Petrography.—Fenton's *The Rock Book* represents a semi-popular story of the rocks intended for the layman. The former widely used *Handbook of Rocks* by Kemp was revised by Grout. Two contributions on sedimentary petrography were issued, namely, the third edition of the classic work *Sedimentary Petrology* by Milner (1940) which is adapted to the use of the petroleum geologist and *Methods of Study of Sediments* by Twenhofel and Tyler (1941), a manual for students or workers in commercial laboratories.

Mining Geology.—Greater attention was being given to structural control in connection with the localization of ore bodies and to the application of geological and geophysical methods to ore-finding as a result of the demands of the second world war. Publication of reports on strategic mineral deposits was being given priority over other types of investigations.



THE "CRATER ROOM," one of a series of chambers in Wyandotte cave, Ind., discovered by guides in 1941

The comprehensive German book on the geology of coal by Stutzer was translated and revised by Noé in 1940. The second edition of Emmon's text and reference book, *The Principles of Economic Geology* was issued in the same year. A revision of the classic *Mining Engineers' Handbook* by Peele prepared with the collaboration of J. A. Church appeared.

Petroleum Geology.—A popular account by Ball describing all phases of the oil industry including the applications of geology bears the title *This Fascinating Oil Business*.

The American Association of Petroleum Geologists continued to sponsor research activities by numerous individuals on fundamental problems of the science. The same association, under the editorship of Levorsen, published the symposium *Possible Future Oil Provinces of the United States and Canada*. This work is of paramount importance in connection with the currently active search for new petroleum reserves in North America. The association also under the editorship of Levorsen issued a report on *Stratigraphic Type Oil Fields*, a symposium by 52 authors. *Source Beds of Petroleum* by Trask and Patnode represents a report of the investigations of the American Petroleum institute and the federal geological survey over the period 1931 to 1941. The results of their extensive studies on *The Time of Origin and Accumulation of Petroleum* by Van Tuyl and Parker were published.

From the standpoint of the petroleum industry as a whole, the excellent treatise *Elements of Petroleum Industry* prepared by 20 contributors under the editorship of De Golyer and published by the American Institute of Mining and Metallurgical Engineers represents one of the most notable works of the year.

Engineering Geology.—Geology continued to be used extensively in engineering construction work. A valuable contribution to this phase of the science is *Cofferdams* by White and Prentis (1940). (*See* also MINERALOGY; PALAEONTOLOGY; SEISMOLOGY.) (F. M. V. T.; B. H. P.)

George VI (1895–), king of Great Britain and Ireland (see *Encyclopædia Britannica*) together with Her Majesty the Queen again spent a busy year, and there must be few bombed areas or large armament factories between Land's End and John o'Groat's that they did not visit. A complete list of their tours is unnecessary, but whether it was Aberdeen (where the queen opened the new King George VI bridge), Edinburgh or Glasgow; Cardiff, Swansea and the most bombed parts of south Wales; the great and battered cities of the midlands and Merseyside; Portsmouth, Plymouth, Devonport or the east end of London, the story was ever the same; the ruins of little houses were inspected and comforting words spoken to the men and women who had lost them; there were receptions by mayors and lord lieutenants in wrecked guildhalls and tasting of dinners in community canteens and "British restaurants"; decorations of service and civilian heroes; endless reviews of troops and civil defense workers; visits to bomber and fighter commands, men of the merchant service—and to hospitals; and while the queen launched the new battleship, the *Duke of York*, and learned how to handle an electric riveter, the king had a personal talk with the shop-stewards at a big works and at Rosyth held an investiture in the dockyard cinema. Soon after he was visiting the

Polish forces training under General Sikorski on a wild moorland stretch in Scotland, then welcoming the Home Guard as they took over the King's Guard at Buckingham palace on the first anniversary of their formation; next day he drove a tank on a factory's testing-ground, and a little later received the dominion and Allied representatives after their conference in June.

The king's voice was not heard on the radio after his empire message—addressed specially to evacuated children at home and overseas—on Christmas day, 1940; but in August the queen broadcast her heartfelt thanks to the women of America for their sympathy no less than for the unceasing flow of canteens, ambulances and medical supplies that came from the United States. The king's message to India in March, thanking the princes and peoples for the magnificent support they were according the common effort, and his speech at the opening of the new session of parliament in November, were his principal public utterances.

Two departures from royal precedent are well worth recording. In Nov. 1940 the king received from the chairman of the Trade Union congress, George Gibson, the gold badge of the T.U.C., a specially struck variant, incorporating the royal arms, of that usually reserved for distinguished foreign visitors; and in March 1941 he went himself to the railway station to greet John Winant, the newly arrived American ambassador—who had been welcomed by the duke of Kent at the Bristol airport—thereby returning the compliment paid to the British ambassador by President Roosevelt when he personally met him on his arrival in American waters. (L. H. D.)

George II (1890–), king of Greece, was born at Tatoi near Athens on July 20, the eldest son of King Constantine, and succeeded to the throne for the first time in 1922. Deposed March 25, 1924 after a series of uprisings, he spent the next 11 years in exile until his recall by the Greek assembly in 1935. For his biography, see *Encyclopædia Britannica*. On Oct. 28, 1940, the day that Italy began its invasion of Greece through Albania, George assumed command of the army. His popularity increased in proportion to the Greek successes in Albania, and he spent considerable time at the front with his troops. On April 23, 1941, as German hordes approached Athens, George fled with members of his government to Crete after issuing a manifesto to the effect that the fight would continue. A month later he narrowly escaped capture by nazi parachute troops in Crete. After hiding in a shepherd's cave, he traveled overland afoot and by mule to the southern shore, where he was evacuated by a British destroyer and taken to Cairo with his premier, Tsouderos. From Cairo he went to Johannesburg, thence to London, where he arrived Sept. 22 to form his government-in-exile.

Georgia. A southern state, one of the original states of the United States, the fourth to ratify the constitution, popularly known as the "Empire State of the South." Area, 58,876 sq.mi. (including 358 sq.mi. of inland water); pop. (1940) 3,123,723. The urban population was 1,073,808 (34.4%), rural, 2,049,915. Capital, Atlanta (302,288). The next largest cities are Savannah (95,996); Augusta (65,919); Macon (57,865).

History.—Eugene Talmadge was inaugurated governor in Jan. 1941, the second man in the state's history to hold the office a third term. Numerous amendments to the constitution were made by referendum in June; one important amendment extended the term of governor and state school superintendent from two to four years. The entire state was placed on eastern standard time March 22, 1941. The biennial session of the General Assembly provided for reorganization of government departments; reduction in salaries of elected officials; more centralized control over state finances by the governor; family drivers' licences; reduction in unemployment compensation tax on employers. Ellis G. Arnall announced his candidacy for the gubernatorial nomination subject to the Democratic primary, 1942. Principal state officials for 1941 included: Eugene Talmadge, governor; John B. Wilson, secretary of state; Ellis G. Arnall, attorney general; George B. Hamilton, state treasurer; B. E. Thrasher, state auditor; Homer C. Parker, comptroller general; M. D. Collins, superintendent of schools; Tom L. Linder, commissioner of agriculture.

Education.—Enrolment in public schools in the biennial report dated June 30, 1940 was as follows: elementary, 642,632 (white, 390,538, Negro, 252,094); high school, 141,880 (white, 120,509, Negro, 21,371); state university (Sept. 1941) 2,980. The teaching staffs were enumerated as follows: elementary, 16,822 (white, 10,912, Negro, 5,910); high school, 5,957 (white 5,067, Negro, 890); state university (Sept. 1941) 254.

Charities, Correction.—Total payments for the year ending June 30, 1941: old age assistance, $3,992,567; blind, $170,974; dependent children, $1,165,169; crippled children $182,932. WPA employment in November, 1940 was 40,430; in November, 1941, 24,412. Population of the state institutions in 1940 was as follows: State hospital, 8,171; School for the Deaf, 225; Training School for Mental Defectives, 1,423; Academy for Blind, 131; Georgia State prison (1939), 915; Boys' Training school, 155; Training School for Girls, 143; Confederate Soldiers' home, 7.

There were 25 almshouses (county) with a population in 1940 of 528 whites and 213 Negroes.

Communication.—State road mileage in 1940 was 13,212.5, including 6,172 miles of paved roads. Railroad mileage, 1940, exclusive of yard and side track, was 7,960. Telephones in use, Nov. 1941, numbered 235,640.

Banking and Finance.—On Sept. 24, 1941 there were 238 state banks with deposits of $188,844,000, and 51 national banks with deposits of $314,416,000. The state revenue department collected in the year ending June 30, 1941 $51,348,312. The largest sources of revenue were the motor fuel tax and the income tax. Total budget appropriations for the year were $52,526,089.84. The state debt was reduced $13,623,000 in the first six months of 1941; on June 30, 1941 it stood at $16,135,000.

Agriculture.—The value of Georgia's main crops for 1941 totalled $178,042,000, an increase of 5.4% over 1940.

Table I.—*Leading Agricultural Products of Georgia, 1941 and 1940*

Crop	1941	1940
Cotton (lint), bales	624,000	1,010,000
Cotton (seed), tons	278,000	449,000
Corn, bushels	42,000,000	46,849,000
Peanuts, pounds	525,950,000	581,625,000
Tobacco, pounds	54,655,000	77,480,000
Hay, tons	790,000	803,000
Velvet beans, tons	505,000	593,000
Sweet potatoes, bushels	7,245,000	5,880,000
Oats, bushels	10,516,000	8,702,000
Peaches, bushels	5,561,000	4,216,000

Manufacturing.—There were, in 1939, 3,150 manufacturing establishments in Georgia which produced goods valued at $677,402,657 and paid $132,188,496 in salaries and wages.

Table II.—*Principal Industries of Georgia, 1939 and 1937*

Industry	Value of Products	
	1939	1937
Cotton broad woven goods	$131,627,016	$164,173,283
Food and kindred products	39,454,548	*
Cotton yarn and thread	38,200,073	46,920,575
Paper and allied products	24,457,566	*
Meat packing	23,648,314	24,987,606
Fertilizer	19,049,712	21,711,717
Saw mills, etc.	18,174,027	*
Cotton seed oil, etc.	16,487,862	27,268,138
Curtains, draperies, bedspreads	15,267,446	6,157,587

*No comparable figures.

Mineral Production.—Georgia's mineral deposits were unknown and undeveloped until 1829, when gold was discovered in McDuffie, White and Lumpkin counties. The value of mineral production in 1940 was $14,836,372. Georgia led the nation in the production of ochre, kaolin, barytes and fuller's earth. Principal mineral products in order of value were stone, raw clay, clay products and cement. (E. C. Gr.)

Georgia Warm Springs Foundation. The foundation is a membership corporation of the state of New York. It is a charitable, non-profit making corporation and conducts a thoroughly modern and scientifically equipped institution at Warm Springs, Ga., with a capacity of 100 beds, for the study and treatment of the after-effects of poliomyelitis (infantile paralysis) under the direction of a competent medical staff. The foundation is the only institution devoting its energies entirely to infantile paralysis. It concentrates its efforts upon a study of types of aftereffects cases in an effort to improve and perfect methods of treatment and make the

knowledge gained thereby available to the medical profession and the public. As a result of the construction of a building providing complete hospital facilities, not previously available on the site, the year 1940 was the first during which the foundation was able in a single building to care for patients and study every phase of treatment of the aftereffects of infantile paralysis.

In 1941 a school for the postgraduate training of physiotherapists was started, financed by a grant from the National Foundation for Infantile Paralysis.

Franklin D. Roosevelt was, in 1941, president of the foundation and Basil O'Connor of New York city was chairman of the executive committee and treasurer. The foundation's address is 120 Broadway, New York, N.Y. (B. O'C.)

German-American Bund. G. Wilhelm Kunze, who succeeded Fritz Kuhn as head of the German-American bund following the conviction and imprisonment of Kuhn for forgery and misuse of the funds of the bund, was indicted with eight others by a New Jersey grand jury in the summer of 1940 for trying to stir up race hatred. When the accused were brought to trial in Jan. 1941 they were all convicted and sentenced to imprisonment for terms varying from one year to fourteen months, but the state supreme court in December reversed the convictions on the ground that the law they were accused of violating was unconstitutional as an unwarranted interference with freedom of speech. The camp in Sussex county, N.J., at which the race hatred addresses were made was closed by the sheriff on the ground that it was a public nuisance. In June 1941 the New Jersey legislature repealed the charter of the bund, thus making it illegal for it to operate in the state. In the previous April the Florida legislature had passed a bill outlawing the bund and all organizations seeking the overthrow of the government by force. In June the wife of Fritz Kuhn sought to obtain the release of her husband on parole from the Dannemora prison in New York. The parole board refused to release him, the chairman saying that release would not be compatible with the welfare of society.

In the first issue following the Japanese attack upon Pearl Harbor on Dec. 7, the *Weckruf und Beobachter*, weekly organ of the bund, announced that the bund would set the example for German-Americans "to conform loyally and unreservedly to the duties of citizenship." A few days later the federal government took possession of the offices in New York city occupied by this newspaper with the bund and the German-American Business league, and closed them to the public. At about the same time FBI agents raided a bund camp at Sellersville, Pa., and arrested the leader. (G. W. Do.)

German Literature. In the realm of literature, as in everything else, national socialism has sought to organize, control and direct. All works must be submitted for approval by the nazi authorities before being printed. This may not be a serious handicap to political, military and technical works which bulk large in the German book output. But for the novelist who would like to portray current problems the path of safety is difficult. Consequently there was a strong tendency toward novels and books of phantasy in which escape from reality and the present were the characteristic features. These "timeless" books give the author scope for his imagination with less fear from the censor, and give the reader welcome diversion from the hard facts of war and its privations. Good examples of this escape literature were: Hans Fallada, *Kleiner Mann—Grosser Mann—Alles Vertauscht,* a story of "the troubles of a little family suddenly lifted by an inheritance out of obscure misery into the shiny hell of a millionaire's life"; Ina Seidel, *Unser Freund Peregrinus,* a kind of dream novel; and Grete Rehder, *Elredefleth,* the story of a submerged saga-village in Holstein.

Two-thirds of the German newspapers were in 1941 owned and published by the nazi party. The other third, under private management, received daily directions from Dr. Goebbels and differed little from the official press. As all the newspapers contained but little trustworthy news of foreign countries and only the official nazi version of domestic news, it is not surprising that there were only half as many newspapers in 1941 as when Hitler came to power in 1933. Their total daily circulation in Oct. 1941 was estimated at 25,000,000 by Max Amann, head of the nazi party publishing office.

Outside Germany, beyond the reach of the censor and the secret police, noted German refugee authors like Thomas and Heinrich Mann, Lion Feuchtwanger, Franz Werfel and many others continued to enrich German literature. Most important for the understanding of Hitler's character and power were works by refugees who sought to explain why they once worked with him and later turned against him: Fritz Thyssen, *I Paid Hitler;* Hermann Rauschning, *Make and Break with the Nazis;* and Otto Strasser, *L'Aigle Prussien sur L'Allemagne.*

BIBLIOGRAPHY.—For brief reviews of German literature, see *Books Abroad,* a quarterly published by the University of Oklahoma. (S. B. F.)

Germany. A totalitarian state or dictatorship, known as the "third reich," in central Europe south of the North and Baltic seas and north of the Alps, Italy and the Balkans. Capital, Berlin (*q.v.*); reich chancellor and leader (Fuehrer), Adolf Hitler (*q.v.*).

Area and Population.—The area of the old reich was 181,742 sq.mi.; population 66,029,806, census of June 16, 1933. According to the census of 1939, published in 1940, the total population of Greater Germany was 79,364,410, including the following populations of the *Länder:* Prussia (excluding the Saar) 41,762,042; Bavaria (excluding the Saar) 8,280,092; Wurttemberg 2,907,168; Mecklenburg 910,828; Baden 2,518,105; Saxony 5,206,863; Thuringia 1,760,597; Hesse 1,469,911; Oldenburg 582,402; Brunswick 599,210; Anhalt 436,215; Lippe 188,600; Hamburg 1,682,222; Schaumburg-Lippe 54,164; Bremen 400,088; Saarland 863,738; Austria 7,009,016; Sudetenland 2,945,263.

There were (1933) 104 cities with a population of more than 50,000 each, and 567 cities and towns with more than 10,000 each. About 32.5% of the population lived in villages of less than 2,000; 10.6% in towns of between 2,000 and 5,000; and 7.3% in towns of between 5,000 and 10,000; almost half the population lived in communities of more than 10,000.

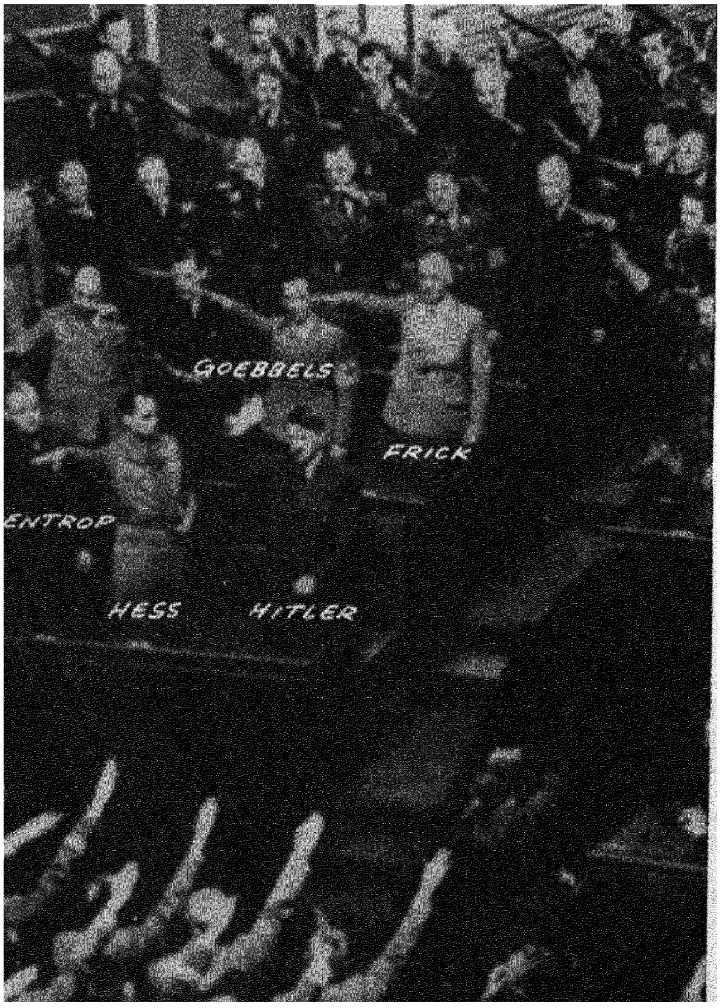
The population of the "greater reich," according to the census of May 17, 1939, was approximately 86,170,000 if the "protectorate" of Bohemia-Moravia is included. This greater reich was created by Hitler's annexation of the following territories: Jan. 13, 1935, Saarland, 864,000; March 13, 1938, Austria, 7,008,000; Oct. 1, 1938, Sudetenland, 2,945,000; March 15, 1939, Bohemia-Moravia, 6,805,000; March 22, 1939, Memel territory, 153,000. In addition, by his war against Poland in Sept. 1939, Hitler added to the 86,000,000 of the greater reich the populations of Danzig, the Polish Corridor, Posen and a strip of territory east of Silesia, regions aggregating 36,242 sq.mi., with a population of 10,000,000. The Poles, as far as possible, were exterminated or removed from these conquered districts and their places taken by Germans from the reich or by tens of thousands of Germans "repatriated" from their old homes in Estonia, Latvia and Lithuania. Hitler also conquered more than half of the rest of Poland; its population of about 15,000,000 was organized under a national socialist administrator, Dr. Hans Frank, as the

"general government" of Poland. Poles, if loyal to their conquerors, were allowed to hold subordinate official positions. Half a million Jews were herded into a walled ghetto in Warsaw.

The reich also controlled more or less completely the governments of the populations conquered in the spring and summer of 1940: Denmark (3,777,000), Norway (2,900,000), Netherlands (8,640,000), Belgium (8,386,000), Luxembourg (300,000) and the northern three-fifths of France, known as "occupied France" (117,000 sq.mi. with an estimated population of 27,800,000). The remaining two-fifths of the former French republic, known as "unoccupied France," and the French colonial empire were left under the Vichy government of Marshal Pétain. Some 70,000 French families were suddenly expelled from Lorraine to unoccupied France, and Lorraine ceased to exist. On Nov. 30, 1940, it was incorporated directly into the "third reich" and combined with the Saar territory under *Gauleiter* (District Leader) Joseph Buerckel as the "Westmark." Alsace, from which French families were also expelled in large numbers, was placed under the administration of Robert Wagner, *Gauleiter* of Baden.

In addition, by the infiltration of German troops and secret agents, Germany gradually acquired domination over Slovakia in 1939 and over Hungary, Rumania and Bulgaria in the winter of 1940–41. In April 1941 a blitzkrieg against Yugoslavia (15,000,000) and Greece (7,000,000) destroyed the independence of those countries, and brought their territories directly or indirectly under German control. Finally, attacking the U.S.S.R. June 22, 1941, Hitler advanced within five months almost to Moscow and reached a line running from Leningrad in the north to the eastern part of the Sea of Azov on the south. In late November and December a strong Russian counteroffensive pushed the German line back about 50 mi., but still left the western half of European U.S.S.R. in German hands at the end of December.

RUDOLF HESS standing beside Hitler in the Reichstag May 4, 1941, six days before the No. 3 nazi's momentous flight to Scotland



History.—Hitler's effort to destroy Britain by cutting off her overseas supplies of food and war munitions led to an intensification of the battle of the Atlantic in the spring of 1941. He sent out his newest and most powerful battleship, the 35,000-ton "Bismarck," accompanied by the cruiser "Prinz Eugen." On May 24, in the icy waters between Iceland and Greenland, they met and sank the British 42,100-ton battle-cruiser "Hood," largest warship in the world. But two days later the "Bismarck" was caught 400 mi. west of Brest and was sent to the bottom May 27, after receiving terrific punishment from British air bombs, torpedoes and direct gunfire. The "Prinz Eugen" escaped, presumably to Brest, where, along with the 26,000-ton battleships "Scharnhorst" and "Gneisenau," she was the object of repeated heavy bombings by the royal air force.

German attacks on British merchant shipping by mines, submarines, surface raiders and bombing from the air reached serious proportions in the spring of 1941, but were far less successful in the summer and autumn, owing in large part to the increased assistance given to Britain by the United States. British merchant shipping sent to the bottom during the four months March-June averaged 500,000 tons a month, according to a statement by Winston Churchill on Nov. 12, 1941. But during the following four months the losses were cut down to an average of 180,000 tons a month, and in November and December to about 100,000 tons a month.

Unable to invade or starve Britain, Hitler made three attempts in the spring of 1941 to destroy her power in the eastern Mediterranean.

In the Balkan campaign German mechanized troops suddenly attacked Yugoslavia and Greece April 6, in order to rescue the Italians who were being driven back into Albania by the Greeks and to check the British who had come to the aid of the Greeks. Yugoslav armies, greatly outnumbered, were defeated and forced to surrender April 18. Parts of their country were given to Italy, Bulgaria and Hungary; another part, the largest, was created into the German puppet state of Croatia (*q.v.*) under a former outlaw, Ante Pavelitch; the remainder was left to the Serbs. Many of the latter, however, escaped to the mountains with their weapons and in the autumn waged a very troublesome guerrilla war against the nazi troops of occupation. Greece, overrun by the end of April, was ruthlessly stripped of its food and other wealth by the nazis and then handed over to Italian occupying troops. The British, who embarked from Greece to Crete, were attacked by German parachute troops and were either killed or captured or escaped to Egypt. Thus, the Balkan campaign, the first of Hitler's three efforts, was a success; the other two were failures.

In the middle east Hitler hoped to use French Syria as a base from which to attack the British in Palestine and Egypt. He also fomented revolution in Iran and anti-British intrigues in Iraq in order to cut off British oil supplies. But the British and Free French occupied Syria in the early summer, and the intrigues in Iran and Iraq were nipped in the bud by the British, who persuaded the governments to expel the German agents.

In Libya British forces under Gen. Sir Archibald Wavell (*q.v.*) had defeated and driven the Italians out of most of the desert between Egypt and Tripoli early in 1941. Hitler, again coming to the rescue of his weak Italian ally, sent strong reinforcements to Libya under Gen. Erwin Rommel (*q.v.*). These troops recovered in April and May all the territories conquered by Gen. Wavell, shut up a British garrison in Tobruk, and even occupied coast towns within the Egyptian frontier. But in mid-November, the British, reinforced by U.S. planes and tanks, made a successful counterattack. They relieved Tobruk after its seven months'

siege, gradually reduced Rommel's German-Italian force of 150,000 men, and by the end of December had captured Bengasi and pushed more than 300 mi. west from Egypt.

Hitler's sudden invasion of the U.S.S.R. on June 22 was of momentous importance. He professedly feared that Stalin (*q.v.*) was planning to attack him, so he decided to attack first. He expected to annihilate the Russian armies in a short blitzkrieg similar to his former victories. But he had gravely miscalculated Russian power of resistance and the extent of Russian preparedness in tanks, planes and other equipment. After five months his armies did succeed in occupying all of White Russia, almost all the Ukraine and the whole of the Crimea except Sevastopol. They captured Rostov, temporarily, and partly surrounded Leningrad, but could not reach Moscow. In late November and December a powerful Russian counteroffensive drove the Germans back along their whole line reaching from the Gulf of Finland to the Sea of Azov.

By Christmas it was clear that Hitler's fundamental aim of destroying the Red armies had failed. The blitzkrieg changed into a retreat. The Germans suffered terribly from the cold, because they had not been provided with the clothing and other equipment for a long winter campaign. The appalling number of dead and wounded in battle and the suffering and loss of life from exposure to cold could not be concealed from the German people. Hitler also lost great numbers of tanks, planes and other war material in the U.S.S.R. during a precious six months in which Britain and the United States were forging ahead in their war production. On Dec. 11, following the example of Japan, Hitler declared war on the United States, thus adding to his enemies the most powerful country in the world. On Dec. 22, as a scapegoat for his own foolish Russian adventure, he dismissed Field Marshal General Walther von Brauchitsch (*q.v.*), and following his "intuitions" took over personal command of the German armies. All these events had a seriously depressing effect upon German morale. (*See* also WORLD WAR II.)

Education and Religion.—Education went through a drastic reorganization under nazi rule. The period of school attendance was shortened by one year in 1937. Many new schools were established to provide a year or two of professional or technical training; for many students this replaced the last years at the regular schools or at universities and the older technical institutes (*hochschule*). Many schools were established for training "leaders" for the nazi party and for government positions; emphasis in them is placed on comradeship, sports, nazi ideology and leadership.

Evangelical Protestants and the Roman Catholics suffered what they regarded as severe persecution under the nazi regime. The Protestant regional churches took steps in 1933 to form a single reich church in accord with Hitler's general policy of centralization. But aggressive nazis, who ordinarily seldom attended church and who indulged in semipagan views, mobilized their efforts to secure the election of Ludwig Mueller as reich bishop of the new church. This caused a split, which grew deeper and deeper, between the official Evangelical church and the really devout Christian Opposition pastors and their followers, led by Dr. Martin Niemoeller, who was placed in a concentration camp.

Pope Pius XI signed with Hitler in 1933 a concordat guaranteeing to the Roman Catholics the free exercise of their religion, their religious schools and their various religious youth, professional and charitable organizations. The guarantees were not observed. Monasteries, nunneries and church funds were confiscated by the nazis, and the Catholic clergy was restricted in preaching and teaching. With the outbreak of war in 1939 an informal truce was made between the Catholic clergy and the government, but in March, 1941, the Vatican newspaper published a protest by the archbishop of Freiburg against nazi oppression. Later the archbishop of Muenster sent a strong complaint to Hitler against Gestapo (secret police) persecution, but the complaint went unheeded.

Defense.—In March, 1935, Hitler repudiated the Versailles treaty clauses which limited Germany to a professional army (*reichswehr*) of 100,000 men, and reintroduced universal military service. In 1939 all young men ordinarily received two years of regular military training, in addition to earlier semimilitary training in the Hitler Youth (eight years) and Labour service (six months).

The approximate size of the German armed forces and the number of industrial workers at various dates is estimated in Table I (in millions of marks):

Table I.—*Armed Forces and Industrial Workers, 1939-41*

	Pre-War	Polish War	End of 1939	French War	End of 1940	Russian War	End of 1941
Armed forces*	2.5	5.0	4.0	6.5	5.5	8.0	6.9
Workers, male	15.8	13.3	14.5	12.2	13.6	12.2	12.0
Workers, female	8.1	7.9	7.6	8.3	8.4	8.5	8.6
Foreign workers	0.5	0.6	0.8	1.0	1.6	1.8	1.8
War prisoners	....	....	0.8	0.6	1.0	1.2	1.3

*Including army, navy and air forces.

It is interesting to note that the German high command and the supreme defense council seem to have acted together very efficiently in demobilizing between campaigns whatever man power could be spared for production purposes; also the steady increase in the number of German female workers, foreign workers and war prisoners.

Finance.—The unit of currency is the German mark, equivalent in U.S. money to 40.3325 cents. Its official exchange value was kept close to its U.S. and other foreign equivalents by rigid government control, but in fact there are many kinds of marks whose actual value depends on where and by whom they are used. There are also special paper "occupation marks" (*reichskassenscheine*) for the use of troops in several of the occupied lands. These have to be accepted by the local population at a rate fixed by Germany, in the U.S.S.R., for instance, at ten rubles to one reichsmark in 1941. As the official rate of exchange before the invasion of the U.S.S.R. was two rubles to one reichsmark, Germany exacted a fivefold profit in 1941. The total amount of these "occupation marks," by which the reich virtually robbed the populations it subjugated, was not divulged.

BRITISH BOMBS dropping on the Knapsack power plant near Cologne Aug. 12, 1941 during a mass daylight raid by 54 Blenheim bombers

No exact statement of German revenues and expenditures can be given, as the budget had not been published after 1935. Taxes collected by the reich central government increased more than sixfold after Hitler came to power, being about 6,000,000,000 marks for 1932–33, and officially estimated by the reich finance minister, Reinhardt, in May 1941, at 40,000,000,000 marks. The war economy decree of Sept. 4, 1939, increased the rate of taxation on many objects; the tax on corporation profits was increased 25% in Aug. 1941, and the tax on luxury articles like tobacco and champagne was considerably raised in November.

The cost of building Germany's war machine was publicly stated by Hitler on Sept. 1, 1939, to have been 90,000,000,000 marks (about

$36,000,000,000). The monthly cost of running the war machine averaged about 4,000,000,000 marks in the autumn of 1939, 5,000,000,000 in 1940, and more than 7,000,000,000 in 1941. About half the cost was met from current taxation, and the other half by government borrowing from savings banks, insurance companies and other public credit institutions. The cost of the German armies of occupation was exacted from the occupied countries in 1940 and 1941. From France, for example, 400,000,000 francs a day was exacted; but this amount in fact was much greater than the actual cost of the army of occupation and made it possible for Germany to use the surplus in buying up control of industries in France and in the Balkans.

Table II.—*Imports, Exports and Balance of Trade, 1932–39*

	Total Yearly			Monthly Average		
	Imports Million marks	Exports Million marks	Balance Million marks	Imports Million marks	Exports Million marks	Balance Million marks
1932 . . .	4,667	5,739	+1,072	389	478	+89
1933 . . .	4,204	4,871	+ 667	350	406	+56
1934 . . .	4,451	4,167	− 284	371	347	−24
1935 . . .	4,159	4,270	+ 111	347	356	+ 9
1936 . . .	4,218	4,768	+ 550	352	397	+46
1937 . . .	5,468	5,911	+ 443	456	493	+37
1938* . . .	6,052	5,620	− 432	504	468	−36
1939† . . .	2,755	2,814	+ 59	458	468	+10

*Figures do not include Austria and Sudeten area.
†Figures are for the first six months of 1939 only.

The publicly admitted reich debt more than trebled during the war, being 37,000,000,000 marks in Sept. 1939, 69,000,000,000 in Sept. 1940 and 114,000,000,000 in Sept. 1941. The 4½% rate of interest on government bonds and treasury notes during the first 18 months of the war was lowered in 1941 to 3½% on new borrowings, thus considerably reducing the cost of the debt.

The reichsbank's gold reserve (including foreign exchange reserves), which was about 4,000,000,000 marks in 1932, had shrunk by Nov. 29, 1941, to 77,179,000 marks. It afforded a coverage of only 0.43% for the paper money in circulation, as compared with a 24.3% coverage in 1932, and with the 40% coverage which before World War I was considered the lowest coverage compatible with safety. The reichsbank's paper note circulation on Nov. 29, 1941, was the largest in its history since the reorganization of the bank in 1924, being 17,792,897,000 marks as compared with the circulation at the end of preceding years: 8,222,000,000 (1938), 11,798,000,000 (1939) and 14,033,000,000 (1940). This increase in paper money and government borrowing and spending would normally tend toward an inflation of prices and a rise in the cost of living, but the government by very rigid control of prices and wages managed to keep the price level close to what it was at the outbreak of the war in 1939. The cost of living index, according to official announcement, rose only from 131.6 in Sept. 1940 to 133.3 in Sept. 1941. The share price index on the Berlin stock market, however, rose from 133.05 in Aug. 1939 to 217.20 in Aug. 1941, and the bond index from 101.26 to 107.20.

Trade and Communication.—After 1935, Germany's exports and imports were very strictly controlled, first by Dr. Schacht's "new system," then by Goering's dictatorial economic power as commissioner for the four-year plan, and finally by the ministerial council for reich defense, established by Hitler on Aug. 30, 1939, and headed by Goering with sweeping powers to co-ordinate economic and administrative activity. Germany's imports and exports and resulting balance of trade during the years 1932–39 are shown in Table II.

The figures show that the imports tended to increase, especially in 1937 and 1938, while the exports increased less, with the result that the balance of trade became less favourable. Among the reasons for this is the fact that Germany increased its imports of raw materials for its rapidly growing armaments, and to some extent its imports of food for its people and fodder for its cattle. The figures do not include the exports and imports of the annexed Austrian and Sudeten territories. If they did so, the deficit in the trade balance would have been greater in 1938, since Austria and the Sudeten territories have always had to import a larger proportion of their food than has Germany; as far as Germany's food problem went, these two territories were a liability rather than an asset.

"OPTIMISTIC STRONG MAN." Mahon's appraisal, in the *Philadelphia Evening Bulletin*, of the task Hitler set for himself June 22, 1941, when he attacked the U.S.S.R.

With the outbreak of war, Germany ceased publishing official statistics so that no exact trade figures were available for 1940–41. From other sources, however, it is clear that Germany was at once cut off from almost all its overseas trade and thus deprived of half of its normal foreign commerce. To compensate for this loss it sought to intensify its trade with its immediate continental neighbours by trade agreements to get food, fodder, iron ore, bauxite, petroleum products and other war materials, in exchange for German coal, machinery and manufactured goods. By its much-advertised "new order" in Europe it also sought to make Berlin, as much as possible, the trading centre for continental Europe by making its neighbours clear their trade accounts in marks through Berlin as a clearing centre instead of settling their accounts directly with one another.

Enemy countries and neutrals had accounted before the war for a large proportion of the reich's imports of strategic raw materials—98.5% of the cotton, 87.7% of the copper, all the rubber and 44.1% of the iron ore. Gasoline and lubricants continued during 1940–41 to be one of the reich's most serious needs, since the annual domestic production of 4,000,000 tons of synthetic gasoline, plus imports from Rumania and the U.S.S.R., hardly sufficed to meet German industrial and war demands. The conquest of Yugoslavia and Greece in April 1941 increased somewhat Germany's supply of food, bauxite, copper and other raw materials. But the invasion of the U.S.S.R. in June cut off all deliveries from that country, and yielded little booty because Stalin's "scorched earth" policy destroyed or removed food, raw materials, rolling stock and factories from the grasp of the advancing German armies.

The German state railway (*reichsbahn*) included in 1938, prior to the annexation of Austria and other lands, 53,330 km. (33,076 mi.) of standard-gauge lines and 879 km. (546 mi.) of narrow-gauge lines. Privately owned lines included 3,732 km. (2,313 mi.) of standard and 752 km. (476 mi.) of narrow gauge. Owing to Hitler's great efforts at rearmament and public works, the railways were not kept up in proper repair with adequate replacement of roadbed and rolling stock. As a result the railways had difficulty in meeting the added strain of war. This was particularly true in the case of hauling oil in tank cars from Rumania and in making coal deliveries to Switzerland, Italy and throughout the reich during 1940–41, and especially true after the Russian invasion added 30,000 km. of railway without any corresponding increase of locomotives and rolling stock.

By the middle of 1939 Germany had completed and opened to traffic 3,065 km. of the new automobile highway network (*reichsautobahn*); 1,383 km. were under construction and preliminary work was proceeding on 2,449 km. The outbreak of war compelled Germany to cut this building program by half. Work was continued only on those stretches which were of greatest strategic or economic importance, particularly in linking Germany with its newly acquired territories in the east. The volume of motor traffic was also sharply curtailed for the duration of the war in order to economize on gasoline. The number of private autos in circulation was cut to 15% of the prewar total. Many trucks were converted to use methane or butane gas instead of gasoline as a motor fuel.

German inland shipping at the beginning of the war included 5,373 vessels moving under their own power and totalling 528,000 tons; and 12,488 canal boats and other vessels without power, totalling 5,835,000 tons. High seas shipping included 3,579 vessels with a total registered net

"INFERIOR DECORATION." An English cartoonist's idea, in the *Daily Dispatch* (Manchester), of Paperhanger Hitler's "new order" for Europe in 1941

tonnage of 2,238,000. During the war, aside from trade in the Baltic, German ocean-going vessels were mostly kept tied up in home ports or in neutral ports abroad. Some vessels which were caught by the British at the beginning of the war or which tried to return home, like the luxury liner "Columbus," were sunk or captured by the British or scuttled by their own crews.

Agriculture, Manufactures, Mineral Production.—Germany's agricultural production in the prewar years in thousands of metric tons was as shown in Table III. The potato harvest of Greater Germany (including Austria

Steel . . .	7,303,200	11,601,700	16,013,500	18,590,900	19,387,000

As a result of Germany's conquest of the resources of Austria, Czechoslovakia, western Poland, Belgium, northern France, Yugoslavia and parts of western U.S.S.R., its mineral and manufacturing products were greatly increased, but they mostly had to be devoted to war purposes. Increased capital and labour were devoted to the production of substitute (*ersatz*) products—synthetic gasoline, rubber, soap, textiles, plastics—in place of imported goods or goods made from imported raw materials. Many of these substitutes were fairly satisfactory, but they required more labour and cost more than the old natural products. Even before the war, Germany suffered from a labour shortage which became more serious with the mobilization of men into the army. The labour shortage in 1940–41 was partly met by bringing in large numbers of captured Poles, Belgians, Dutch, Serbs and Russians to work in German fields or factories; French prisoners, who numbered nearly 2,000,000, were also in many cases set to work. Some 70,000 Italians went to work in the reich.

Girl Scouts. Members of all ages were active in defense work of all kinds, but to fill a special need for older girls, the Senior Service Scout program of civilian defense activities was launched in the fall of 1941. Senior high school girls were required to pass stiff tests before they were qualified to wear the triple S insignia. They then might specialize in one of four fields: foods; child care; transportation and communication; clothing, shelter and recreation.

Contributions to the Juliette Low memorial fund, set up in memory of the founder of girl scouting in the United States to promote understanding among girls of all nations, reached an all-time high. Part of the money was used for the relief of guides and scouts of war-torn lands, especially China, Britain and refugee guides in Britain. Part was used to finance the second western hemisphere encampment to foster friendship among the girls of the Americas. One hundred sixty American girls were hostesses to delegates from Argentina, Barbados, Bermuda, Brazil, British Guiana, British Honduras, Canada, Cuba, Guatemala, Jamaica, Mexico, Newfoundland, Puerto Rico, Trinidad and the Virgin Islands. As a result of suggestions made by the girls themselves, a third encampment was planned for 1942.

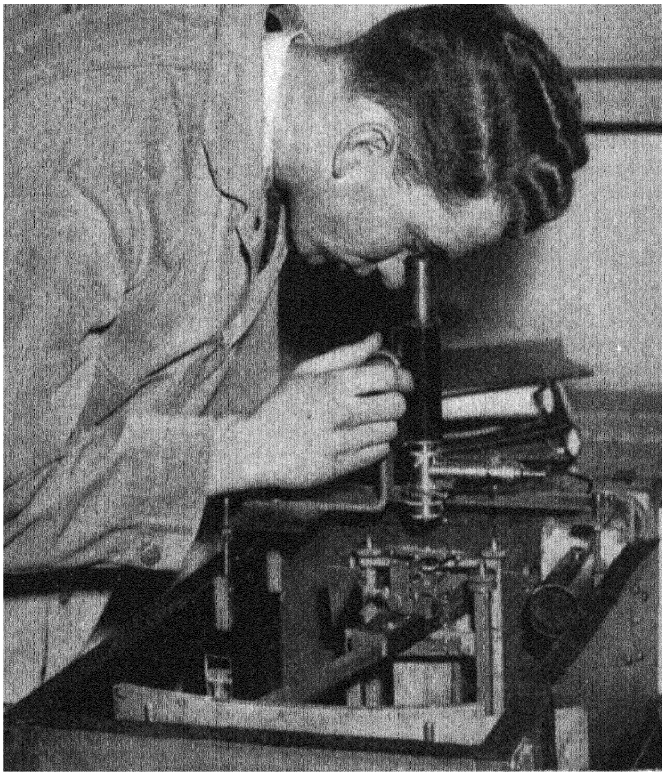
In 1941 there were approximately 670,000 members of the Girl Scout organization in the United States. Of these, more than 100,000 were adults, the rest, girls ranging in age from seven to eighteen. (C. M. R.)

Glands: *see* ENDOCRINOLOGY; MEDICINE.

Glass. The year 1941 was one of great activity in the American glass industry. Production reached the highest value in history, approaching $440,000,000. Almost all lines of glassware shared the increased demand arising from higher national income, but the greatest gain was made by window glass, as a result of new construction in connection with preparation for war. More than 16,000,000 boxes (800,000,000 sq.ft.) of window glass were produced.

Plate glass output, curtailed somewhat in the latter part of the year by reduced production of automobiles, amounted to 190,000,000 sq.ft. Small volume was anticipated for 1942, because no private cars would be made, and few buildings requiring plate glass would be constructed.

Nearly 10,000,000,000 bottles and containers were made. Part of these were needed to offset the shortage of tin and other materials used in metal and paper containers. Statistics were not available for illuminating glassware and pressed and blown ware, but these branches of the industry enjoyed unusual prosperity. Optical glass, because of the military demand, showed large gains in volume of production and in plant capacity.



MEASU[illegible] TEXTURE of [illegible] at the Mellon Institute of Industrial Research, Pittsburgh, Pennsylvania

Fibre glass, glass blocks, cellular glass in blocks for insulating purposes, fluoride films on lens surfaces to diminish reflection, and lightweight bottles were among new items manufactured in larger quantity. Growing demand for fluorescent lighting units resulted in the establishment of new plants for making the necessary tubing. The commercial production of ground and polished plate glass, coloured and only 3/4-in. thick, for use in goggles and as laminated windows for aeroplanes, was an outstanding achievement of the year.

The effect of World War II on the glass industry in America appeared in the statistics, and was reflected in the scarcity of certain glassmaking chemicals, notably soda ash, cryolite and metallic oxides used in colouring.

Research and Invention.—Research and invention continued, with 329 U.S. patents relating to glass and its manufacture issued during 1941. The government's anti-patent-monopoly suit was still far from a decision, after reams of testimony had been heard. New silica-free glasses of high refractive index, invented by G. W. Morey, came into lens production. Fabrics woven from glass threads replaced other cloths for certain technical and military purposes. (S. R. S.)

Gliding. The most important development in motorless flying in 1941 was the military use of large troop-carrying gliders. Following their successful employment for surprise attack by the Germans in Belgium and Crete, new designs were started by the U.S. army and navy. These craft were planned to carry from 8 to 24 fully equipped soldiers and the larger types to have a wing span of more than 100 ft. Several were planned to be towed behind a single transport or bombing plane, and this would probably lead to commercial application for air transport.

Training of army air corps pilots in glider flying was begun at Elmira, N.Y. following the conclusion of the 12th annual National Soaring contest in July. John Robinson, who again won the national championship, became chief instructor of the school, which was operated by the Elmira Area Soaring corporation. Marine corps pilots were being trained at the Frankfort-Lewis School of Soaring at Joliet, Ill. and the Motorless Flight institute, Chicago Heights, Ill. Another school for civil instruction was the Briegleb Soaring school, Van Nuys, Calif.

Parker Leonard, newly elected president of the Soaring Society of America, reported that there was a marked increase in public interest and participation in the sport of gliding and soaring during the year. Many of the pilots and builders were employed in the factories and schools. (L. B. Ba.)

G-Men: *see* Federal Bureau of Investigation.

Goering, Hermann Wilhelm (1893–), German reichsmarshal and statesman, was born at Rosenheim, Bavaria, on Jan. 12 and was commander of the famed Richthofen squadron in the German air force during World War I after Richthofen's death. Goering was an early member of the nazi party and became air minister and minister of the interior in 1933 upon Hitler's accession to the chancellorship. (See *Encyclopædia Britannica.*) On July 19, 1940 Hitler conferred the newly created title of marshal of the reich on Goering and declared before the reichstag that his aide, as creator of the German air force, "has individually made the highest contribution to the reconstruction of the German army." Goering, appointed head of the economics general staff on Jan. 4, 1940, had supreme control over Germany's economic life.

As usual, Goering spent much time in 1941 at the various fighting fronts; in addition, he took over some of the diplomatic duties formerly reserved to Hitler and Ribbentrop (*qq.v.*). On March 5, in a conference with Ion Antonescu (*q.v.*) at Vienna, he secured for Germany the right to overrule all Rumanian economic pacts with other countries. On Dec. 1 he met with Marshal Pétain (*q.v.*) at St. Florentin in occupied France, to confer on French collaboration with Berlin. Despite many rumours of a rift with Hitler, Goering continued to direct the *Luftwaffe* in 1941.

Gold. A turning was at last reached in 1941 in the long lane down which gold had been moving for more than seven years. Ever since the devaluation of the dollar in Jan. 1934, gold had been moving toward the United States. A variety of influences conspired to heap gold on the United States in an unprecedentedly mountainous pile. Gold arrived because the dollar was priced too cheaply by government action in 1934. Gold arrived because European nationals were fearful, in the years before Sept. 1939, of a conflagration in Europe. Gold streamed in because governments in Europe sought to place their metallic reserves beyond a conqueror's grasp, and because the Japanese government required dollars to buy materials for the war for which it was so strenuously preparing. Latterly, gold flowed to the United States in a swollen torrent to provide purchasing power for the British empire in its struggle with the axis powers.

These mighty forces, which in seven years had swept $16,000,000,000 of gold to the United States, spent themselves abruptly in the late spring of 1941. Slowly opposing influences took shape and gained momentum, and finally, as the year drew to a close, the flow of gold turned outward from the United States. The losses of the metal which the United States experienced were on a scale greatly reduced from the vastness of the preceding inflow. Nevertheless, it was recorded that the gold stock of the United States showed a net decline in November—the first month since Feb. 1933, just before the banking holiday, in which the United States sold to foreign countries more gold than it bought from them and from its own domestic mines.

In five of the last nine weeks of 1941 the United States lost gold on balance, and the trend carried over into the early weeks of 1942. For the year as a whole the gold reserve of the United States expanded $741,000,000 net to a total of $22,736,000,000. But the rise was noticeably the smallest for any year since 1934. It compared with a net increase in the gold stock of $4,351,000,000 in 1940, $3,132,000,000 in 1939, $1,751,000,000 in 1938 and $1,502,000,000 in 1937. In contrast to these huge increases the net shrinkage of $60,000,000 in the gold stock in the concluding nine weeks of 1941 seemed trivial.

In considering the break which the gold movement made in 1941 with its recent past, a beginning may be made by noting the exhaustion of those forces which brought gold to the United States in the years after 1933 in unparalleled volume. The mastery which Germany gained of the European continent prevented the continuance of the flow of refugee gold to the United States. Fears by Japan that the United States would "freeze" its balances—fears that were borne out in July—brought to a halt the shipments of gold eastward across the Pacific. The "freezing" regulations made it impossible for several of the occupied European nations to sell any large amount of the gold which they had under earmark at the Federal Reserve Bank of New York.

Most important of all, though, was the virtual exhaustion of the gold resources of the United Kingdom. In a letter dated Jan. 21, 1941, Secretary of the Treasury Henry Morgenthau, Jr., disclosed official British figures showing a decline of $2,316,000,000 in the gold and dollar resources of the United Kingdom in the first 16 months of the war. These official estimates placed the British gold holdings at $2,038,000,000 on Aug. 31, 1939, the day before Germany invaded Poland. By Dec. 31, 1940, the British gold stock had fallen by $1,746,000,000 to a net available sum of

$241,000,000, which was considered the minimum amount necessary for the British central banking and currency reserves.

With the virtual depletion of the British gold reserve, the United States government took a step of great significance, considered purely on the ground of international capital movements. The Lend-Lease act became law in March 1941, providing for dollar advances by the United States treasury to cover debts thenceforth contracted by Britain, as well as other countries resisting the axis if they needed dollars, in the purchase of war materials in the United States. The importance of this move was not confined to the sphere of the war. Economically, it meant that the United States was, after an interval of years, making foreign loans or their equivalent. The retirement of the United States as a foreign lender ten years before had left the favourable balance of payments of the country an unrelieved drain on the gold reserves of the rest of the world. The privileges of the Lend-Lease act were widely availed of, and by its workings the United States exported goods without receiving gold in exchange.

In still another way did the United States lend dollar resources to foreign nations. Through the Export-Import bank of Washington, a government institution, large sums were placed at the disposal of Latin-American countries, and the dollar resources of these western hemisphere nations were still further augmented by the large-scale purchasing of their commodities by the United States. It was these same Latin-American nations which were thereby enabled to reverse the gold flow which had been running so heavily and without a break to the United States for years. They began converting a portion of their swollen supply of dollar balances into gold and placing the gold under earmark to their account in the United States. Largely because of their buying, the quantity of gold under earmark at New York increased $307,900,000 in the first 11 months of 1941 to the highest level on record at $2,115,600,000.

It is not possible to set the gold movement story down in the accustomed detail for 1941 because the war led to a suspension of gold statistics by the U.S. department of commerce. In May 1941 the department of commerce discontinued publication of gold export statistics by country of destination. Following the Japanese attack on Pearl Harbor on Dec. 7, the department suspended publication of gold import and export statistics by months. The table gives the gold import figures for all of 1940 and the first ten months of 1941.

Gold Receipts of the U.S., 1941 and 1940
(000's omitted)

	1941*	1940		1941*	1940
Total	$879,163	$4,749,467	Norway	$.....	$ 33,405

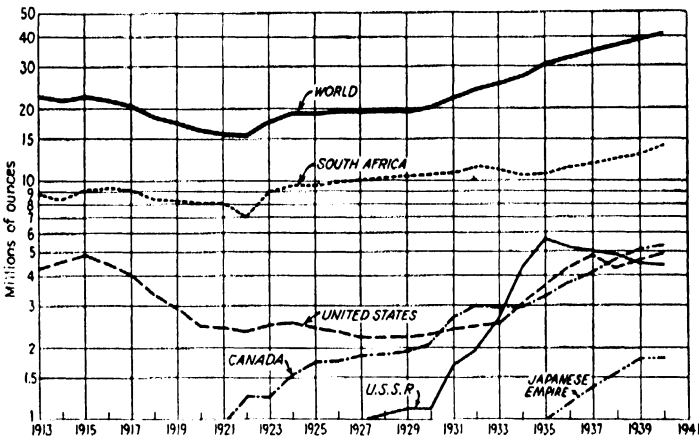
Italy	.....	43,935	Colombia	20,100	23,000

*Ten months.

With the spread of the war over the entire world, the shipments of gold across the oceans which mark times of peace were all but ended. Perhaps never were foreign exchange dealings so completely at a standstill. As the year closed the gold standard was in low estate, its usefulness as a medium for settling international balances confined almost entirely to transactions between Latin America and the United States. (*See* also EXCHANGE CONTROL AND EXCHANGE RATES. (E. H. Co.)

Production.—Although there had been no suppression of statistics on gold production because of the war, the general slowing down of the distribution of data left only scanty information. The 1940 world total was estimated at 41,000,000 oz., and this



GOLD PRODUCTION: world total and output of the principal producing countries *(The Mineral Industry)*

was expected to increase in 1941, as it had in every year since 1932.

The only information available on South Africa, the leading producer, was that the 1940 total of 14,047,000 oz. would be surpassed in 1941.

In the United States, gold production increased by 5% in 1940 to 5,984,163 oz. for mine production, and 6,003,105 oz. for refinery production, a 7% increase. The usual monthly figures were lacking for 1941, but preliminary estimates indicated an increase of about 10% over 1940.

Canadian production to the end of Oct. 1941 was 4,466,373 oz., against 4,409,571 oz. in the same period of 1940, and 5,322,857 oz. for the full year of 1940.

Mexico reported 431,900 oz. for the first half of 1941, as compared with 883,124 oz. in the full year of 1940.

The price of gold remained unchanged throughout the year, at $35.00 in the United States and 168*s.* in Great Britain. (*See* also FEDERAL RESERVE SYSTEM; MINERAL AND METAL PRICES AND PRODUCTION.) (G. A. Ro.)

Golf. Individual players of national standing entered the military service, including among others Charlie Yates of Atlanta, former holder of the British amateur championship, and Ed Oliver, young Delaware professional, who achieved considerable notice during 1940 by equalling the score at which Gene Sarazen and Lawson Little tied for the Open Championship, only to be disqualified for starting his last round before his scheduled starting time.

Important titular competitions for the year saw honours distributed equally between representatives of the Pacific and Atlantic coast regions, to the exclusion of the midland sections.

Marvin "Bud" Ward of Spokane, Wash., regained the amateur championship, which he had previously won in 1939, in the annual tournament held at the Omaha Field club. In the final match he defeated another Pacific coast player, Pat Abbott of California. The tournament was marked by the heavy toll of well-known players eliminated in the first two rounds of matches, each at 18 holes. Among those beaten were defending champion Richard Chapman and former champions Johnny Fischer and Johnny Goodman. The latter, a popular favourite with Omaha galleryites, was eliminated by Bobby Riegel, a little-known player. Goodman's experience was in a way a re-enactment of the experience of Robert T. Jones, whom Goodman defeated in the first round of the 1929 championship, to become nationally known overnight.

Mrs. Frank Newell, formerly Miss Elizabeth Hicks, of Long Beach, Calif., won the women's championship, played over the course of the famous country club of Brookline near Boston, Mass., defeating Helen Sigel of Philadelphia, Pa., in the final match. Mrs. Newell is the first representative of the Pacific coast to win this title. Combined with the triumph of Ward, her victory gave that section its first double victory in the important national championships.

Scarcely more than two months after winning the title, Mrs. Newell announced that she was giving up her amateur status, and entered the shop of a Long Beach professional to begin her apprenticeship toward becoming a professional teacher of the game.

In the professional field, Craig Wood, representing the Winged Foot Golf club of New York, won the open championship, played over the course of the Colonial club of Fort Worth, Tex. His winning total was 284. Victor Ghezzi of the Deal Golf club on the New Jersey coast, won the Professional Golfers' association championship, over the course of the Cherry Hill club of Denver, Colo. In the final he defeated Byron Nelson in an extra-hole match. The triumph was the most notable in the career of the New Jersey player.

Considering the ill fortune which had attended him in previous important competitions over a period of several years, the victory of Wood was possibly the most popular with golfers throughout the country since the completion of the famous "grand slam" by Robert T. Jones in 1930.

Twice before Wood had tied for national Open titles. First in 1933, when he finished even with Densmore Shute in the British Open, and lost in the play-off. Again in the 1939 U.S. Open, when he finished in a three-way tie with Shute and Byron Nelson. Nelson won that play-off. Further in the 1934 Professional Championship, Wood and Paul Runyan were even at the end of 36 holes in the final match. Runyan won at the second extra hole.

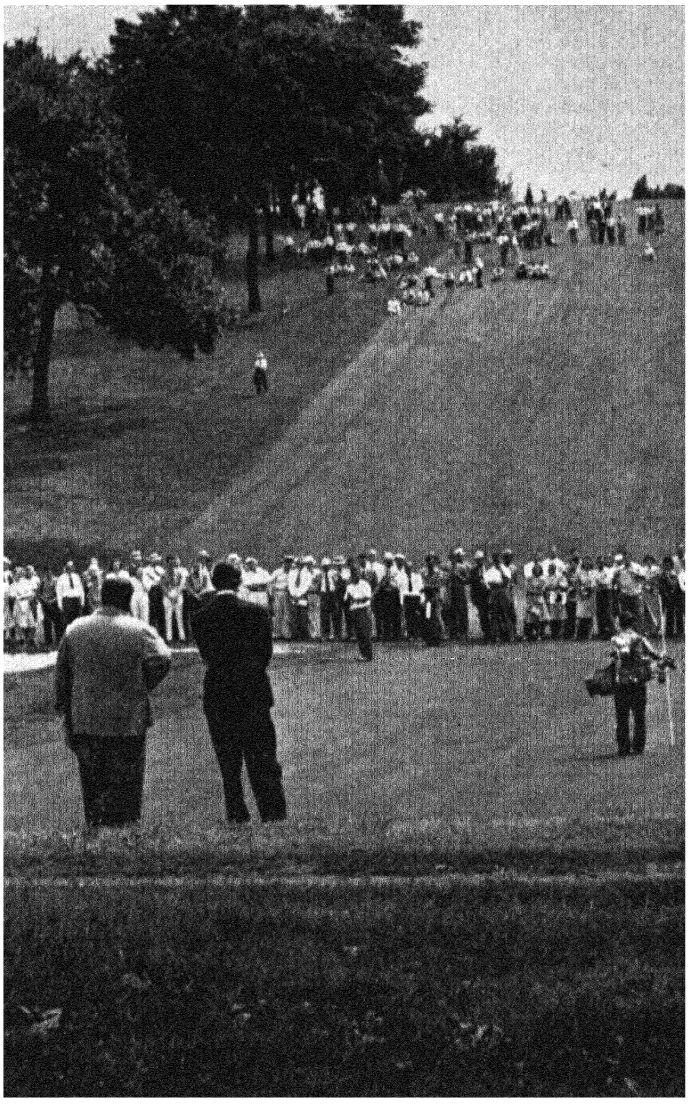
Wood enjoys the distinction of being the oldest native-born player ever to win this championship. He was a matter of some five months short of his 40th birthday when he won. Ted Ray, who won at the age of 44, is the oldest ever to win.

International relations with European golf were wholly blotted out by the war. At the same time, relations with golfers in South America continued to be fostered. Following the precedent of other professionals in earlier years, Sam Snead and Jimmy Demaret visited Argentina, where they took part in a number of special matches. Demaret won the Argentine Open championship. Both were highly pleased with the cordial reception given them. Meantime, Mario Gonzalez, a fine young amateur player from São Paulo, Brazil, took part in the United States amateur championship and drew the plaudits of observers for his skilful play and engaging personality.

The year marked the 20th playing of the Public Links championship, over the Indian Canyon public course of Spokane, Wash. No more fitting proof of the popularization of the game throughout the country, than the growth of this event, can be cited. The championship was inaugurated at Toledo, Ohio, in 1922. There were 138 entries. This year's event attracted a total of 2,816, who engaged in sectional elimination contests in more than 30 cities.

This was by far the largest entry ever recorded in a national championship. William Welch, employee of an oil company in Houston, Tex., won the championship. In the final match he defeated John J. Kern, a Denver insurance man.

Another record was established in the total or prize money offered for competition by professional players, when purses passed the $200,000 mark. Approximately half of this was distributed among contenders in events of the winter season. This begins around the middle of December and ends at mid-April.



SPECTATORS at the 1941 national amateur golf tournament in Omaha, Neb. were reprimanded for poor sportsmanship in showing their hostility to the winner, Marvin Ward of Spokane. In the photograph the crowd watches an early contestant send a long putt to the pin

This development has been achieved largely by the efforts of the tournament bureau of the Professional Golfers' association.

Incidental to tournament earnings, Ben Hogan, professional at the Hershey country club at Hershey, Pa., repeated his performance in 1940 in leading all rivals. His total from purses exceeded $17,000. In the Hurst tournament at Philadelphia, Pa., which ended Sept. 21, Hogan failed to finish among the money-winners for the first time through 57 consecutive starts.

Five additional nominations for golf's hall of fame were elected. They are: Charles "Chick" Evans, and Jerome D. Travers, both former winners of the U.S. Amateur and U.S. Open championships, J. J. McDermott, first American-born professional to win the U.S. Open championship (1911), and Alex Smith and Willie Anderson, both Scottish-born professionals, who won the U.S. Open championship two or more times.

Under the sponsorship of the Professional Golfers' association, plans for the hall of fame contemplated the creation of a shrine of golf at the Augusta National Golf club at Augusta, Ga. Four players were named in the original selection, Robert T. Jones, Francis Ouimet, Walter Hagen and Gene Sarazen. A trio of veteran golf writers, Grantland Rice of New York, O. B. Keeler of Atlanta, Ga., and A. Linde Fowler of Boston, Mass., constitute the committee on nominations.

In keeping with the efforts of sports generally, golf made a considerable contribution to the different campaigns for raising funds for patriotic purposes. Scores of well-known players, both amateur and professional, participated in this work. Notable was

a special three-round match, staged in Boston, New York and Detroit, between two of the most famous of all baseball players, who have taken enthusiastically to golf in recent years, Tyrus Raymond Cobb, and George Herman "Babe" Ruth. Cobb emerged the winner of this interesting match, by a small margin.

Following the declaration of war, action by the federal government, looking toward the conservation of rubber, imposed gross curtailment in the manufacture of balls for the duration of the war. (I. Bn.)

Government Departments and Bureaus.

The following are the leading officers of the more important government departments and bureaus of the United States. The date for the information is Jan. 1942.

Department or Bureau	*Name*	*Post*
Department of State	*Hull, Cordell	Secretary
	*Welles, Sumner	Under-Sec'y
Department of the Treasury	Morgenthau, Henry, Jr.	Secretary
	Bell, Daniel W.	Under-Sec'y
Bureau of Comptroller of Currency	Delano, Preston	Comptroller
Treasurer of the U.S.	Julian, William A.	Treasurer
Bureau of Customs	Johnson, W. R.	Commissioner
Bureau of Internal Revenue	Helvering, Guy T.	Commissioner
War Department	*Stimson, Henry L.	Secretary
	Patterson, Robert P.	Under-Sec'y
Chief of Staff	*Marshall, George C., Gen.	Chief of Staff
Office of the Adjutant General	Adams, E. S., Maj. Gen.	Adjt. General
Office of the Chief of Engineers	Reybold, Eugene, Brig. Gen.	Chief
The Army Air Forces	*Arnold, H. H., Maj. Gen.	Chief
Department of Justice	*Biddle, Francis	Att'y-Gen.
Solicitor General	Fahy, Charles	Solic. Gen.
*Federal Bureau of Investigation	Hoover, J. Edgar	Director
Bureau of Prisons	Bennett, James V.	Director
Immigration and Naturalization Service	(Vacancy)	Commissioner
*Post Office Department	Walker, Frank C.	Postm'r Gen.
Department of the Navy	*Knox, Frank	Secretary
	Forrestal, J. V.	Under-Sec'y
Office of Chief of Naval Operations	*Stark, H. R., Adm.	Chief
Bureau of Navigation	Jacobs, Randall, Rear Adm.	Chief
Bureau of Ordnance	Blandy, W. H. P., Rear Adm.	Chief
*U.S. Marine Corps Headquarters	Holcomb, Thomas, Maj. Gen.	Commandant
*U.S. Coast Guard	Waesche, Russell R., Rear Adm.	Commandant
Department of the Interior	Ickes, Harold L.	Secretary
	Dempsey, John J.	Under-Sec'y
General Land Office	Johnson, Fred W.	Commissioner
Office of Indian Affairs	Collier, John	Commissioner
Geological Survey	Mendenhall, W. C.	Director
*Fish and Wild Life Service	Gabrielson, Ira N.	Director
Bureau of Reclamation	Page, John C.	Commissioner
*National Park Service	Drury, Newton B.	Director
Bureau of Mines	Sayers, R. R.	Director
Division of Territories and Island Possessions	Swope, Guy J.	Director
Department of Agriculture	*Wickard, Claude R.	Secretary
	Appleby, Paul H.	Under-Sec'y
Bureau of Agricultural Economics	Tolley, Howard R.	Chief
Agricultural Marketing	Hendrickson, Roy F.	Administrator
Surplus Marketing Administration	Gaumnitz, E. W.	Administrator
Commodity Exchange Administration	Mehl, Joseph M.	Chief
Agricultural Marketing Service	Kitchen, Clarence W.	Chief
Agricultural Adjustment and Conservation	Evans, R. M.	Administrator
Agricultural Adjustment Administration	Wallace, Fred S.	Administrator
*Soil Conservation Service	Bennett, Hugh H.	Chief

Office of Defense Transportation	Eastman, Joseph D.	Director

*Discussed elsewhere in this volume.

†Abolished Jan. 12, 1942, and succeeded by the National War Labor Board, with William H. Davis as chairman.

‡President Roosevelt announced Jan. 13, 1942, that he would create the War Production Board, with Donald M. Nelson as chairman, and that the Supply Priorities and Allocations Board would be abolished.

Great Britain.—The following were the ministers and chief permanent officials of the more important of the government departments of Great Britain at the close of 1941:

Ministry or Department	*Name*	*Post*
Admiralty, The Board of	A. V. Alexander	First Lord
	Sir Henry Markham	Permanent Secretary
Agriculture and Fisheries	R. S. Hudson	Minister
	Sir Donald Fergusson	Permanent Secretary
Aircraft Production	Col. J. T. C. Moore-Brabazon	Minister
	Sir Archibald Rowlands	Permanent Secretary
Air Ministry	Sir Archibald Sinclair	Secretary of State
	Sir Arthur Street	Perm'nt Under-sec'y
Burma Office	L. S. Amery	Secretary of State
	J. C. Walton	Perm'nt Under-sec'y of State (Acting)
Cabinet Office	Sir Edward Bridges	Secretary
Civil Service Commission	A. P. Waterfield	1st Commissioner
Colonial Office	Lord Moyne	Secretary of State
	Sir Cosmo Parkinson	Perm'nt Under-sec'y
Commissioners of Crown Lands	The Minister of Agriculture and Fisheries (*ex-officio*)	Commissioner
	C. L. Stocks	Perm'nt Commissioner
Crown Agents for the Colonies	Sir W. Cecil Bottomley	
	H. C. Thornton	
Customs and Excise, Board of	C. Wilfred G. Eady	Chairman
Dominions Office	Lord Cranborne	Secretary of State
	Sir Eric Machtig	Perm'nt Under-sec'y (Deputy)
Duchy of Lancaster	A. Duff Cooper	Chancellor
	Lord Hankey	Deputy Chancellor
Economic Warfare, Ministry of	Hugh Dalton	Minister
	Sir Frederick Leith-Ross	Director-General
Education, Board of	R. A. Butler	President
	Sir Maurice Holmes	Permanent Secretary
Food, Ministry of	Lord Woolton	Minister
	Sir Henry L. French	Secretary
Foreign Office	*Anthony Eden	Secretary of State
	Sir Alexander Cadogan	Perm'nt Under-sec'y
Health, Ministry of	Ernest Brown	Minister
	Sir John Maude	Secretary
Home Office and Ministry of Home Security	Herbert Morrison	Secretary of State
	Sir Alexander Maxwell	Perm'nt Under-sec'y Home Office
	Sir George Gater	Secretary, Ministry of Home Security
India Office	L. S. Amery	Secretary of State
	D. T. Monteath	Acting Perm'nt Under-sec'y
Information, Ministry of	Brendan Bracken	Minister
	Sir Walter Monckton	Director-General
Inland Revenue, Board of	Sir Gerald B. Canny	Chairman
Labour and National Service, Ministry of	*Ernest Bevin	Minister
	Sir T. W. Phillips	Secretary
Lord Privy Seal	C. R. Attlee	Lord Privy Seal
Mines Department	D. R. Grenfell	Secretary
	Sir Alfred Hurst	Under-sec'y
Patent Office	M. F. Lindley	Comptroller-General
Paymaster-General's Office	Lord Hankey	Paymaster-General
	L. Cuthbertson	Asst. Paymaster-Gen.
Pensions, Ministry of	Sir Walter Womersley	Minister
	A. Cunnison	Permanent Secretary
Petroleum Department	Geoffrey Lloyd	Secretary
	Sir Alfred Faulkner	Perm'nt Under-sec'y
Post Office	W. S. Morrison	Paymaster-General
	Sir Thomas Gardiner	Director-General
Privy Council Office	Sir John Anderson	Lord President
	Sir Rupert B. Howorth	Clerk of the Council
Public Record Office	The Master of the Rolls	Keeper of the Records
	C. T. Flower	Deputy Keeper
Public Trustee Office	Sir Ernest Fass	Public Trustee
Scottish Office	Thomas Johnston	Secretary of State
	Sir Horace P. Hamilton	Under-sec'y of State
Stationery Office, H.M.	Sir William R. Codling	Controller
Supply, Ministry of	*Lord Beaverbrook	Minister
	Sir William Brown	Permanent Secretary
Trade, Board of	Sir Andrew Rae Duncan	President
	Sir Arnold E. Overton	Permanent Secretary
Treasury	*Winston Churchill	Prime Minister, First Lord and Minister of Defense
	Sir Kingsley Wood	Chancellor of the Exchequer
	Sir Horace Wilson	Permanent Secretary and Head of H.M. Civil Service
War Office	Capt. David Margesson	Secretary of State
	Sir James Grigg	Perm'nt Under-sec'y
War Transport, Ministry of	Lord Leathers	Minister
	Sir Cyril W. Hurcomb	Director General
Works and Buildings, Ministry of	Lord Reith	Minister
	Sir Geoffrey Whiskard	Permanent Secretary

Granger, Walter (1872–1941), U.S. explorer and palaeontologist, was born Nov. 7 in Middletown, Vt. With only two years of high school training, he began his career in science by working as an assistant in taxidermy and as an apprentice to scientists in the American Museum of Natural History in New York city. In 1927, after nearly 40 years with the museum, he became curator of fossil mammals, a post he held until his death. A veteran of 28 expeditions, mostly through the wilds of Egypt and Mongolia, Dr. Granger spent 10 years, 1921–31, with Roy Chapman Andrews in the Gobi desert, where the two explorers made a valuable collection of dinosaur bones and eggs. He also unearthed fossil remains in the Dakota Bad Lands, most notable of which was a giant rodent of the middle Oligocene period, found in 1940. Dr. Granger, who was awarded an honorary doctor of science degree from Middlebury college in 1932, was the author of several books on palaeontology. He died in Lusk, Wyo., Sept. 7.

Granite: *see* STONE.

Grapefruit. Production of grapefruit in the United States in 1941 was estimated Dec. 1 by the department of agriculture as 41,490,000 boxes, compared with 43,033,000 boxes in 1940. In California and Arizona boxes of grapefruit average 60 lb.; in Florida and Texas, 80 lb.

U.S. Grapefruit Production by States, 1941 and 1940

State	1941 boxes	1940 boxes	State	1941 boxes	1940 boxes
Florida			Arizona	3,000,000	2,650,000
Seedless varieties	8,800,000	8,400,000	California		
Other varieties	12,600,000	16,200,000	Desert Valleys	965,000	960,000
Texas	15,100,000	13,600,000	Other varieties	1,025,000	1,023,000

In Trinidad the arrival of a large force of Americans to construct military bases provided an unexpected outlet for the largest crop of grapefruit on record in that island—290,000 boxes of 100 lb. each, compared with 260,000 boxes in 1940. Consumption of grapefruit juice increased more than 1,000% and utilized a part of the crop which could not be exported to the United Kingdom and Canada because of a shortage of shipping. The British ministry of food contracted for 8,400 tons of grapefruit pulp in Jamaica, providing an outlet for production which amounted to 180,000 boxes in 1941 as compared with 185,000 boxes in 1940. Exports of grapefruit to the United States from the Isle of Pines Aug.–Oct. 1941 were 150,314 boxes, a slight decrease from 153,000 boxes in 1940. Preliminary estimates placed the 1941–42 crop in Honduras at 140,000 boxes, compared with 80,000 boxes the previous season. No figures were available in 1941 from Palestine, which in the years preceding the war had developed a rapidly expanding production and shipped more than 2,000,000 boxes annually to Europe. (S. O. R.)

Grapes. The U.S. grape crop of 1941 was estimated by the department of agriculture as 2,651,430 tons, 4% larger than the 1940 crop of 2,547,910 tons. The ten-year (1930–39) average annual production was 2,264,062 tons. Raisins were 220,000 tons (dry basis) in 1941, and 171,000 tons in 1940; ten-year average, 215,600 tons. One ton of dried raisins is equivalent to about four tons of fresh grapes. In California, the outstanding

U.S. Production of Grapes by Leading States, 1941 and 1940

State	1941 tons	1940 tons	State	1941 tons	1940 tons
California	1,990,800	2,250,000	Pennsylvania	21,920	23,000
New York	71,750	75,800*	Arkansas	9,810	9,600
Michigan	57,330	54,600	Missouri	9,770	10,000
Ohio	30,300	37,500	Illinois	6,770	8,100

*Includes 3,000 tons not harvested because of market conditions.

producer, the total of all varieties grown in 1941 was 1,990,800 tons, compared with 2,250,000 tons in 1940 and a ten-year average of 2,411,000 tons. Wine varieties accounted for 497,000 tons of the 1941 California production, as against 607,000 tons in 1940 and the ten-year average of 583,000 tons. Raisin varieties grown in California in 1941 were 1,143,600 tons. In 1940 raisin grapes in California totalled 1,213,000 tons; the ten-year average was 1,421,000 tons. Table varieties in California in 1941 were 350,200 tons as compared with 430,000 tons in 1940, and a ten-year average of 407,000 tons. Late spring freezes caused considerable damage to the 1941 grape crops in New York, Pennsylvania, Ohio and Michigan. Further injury to the crops in New York and Pennsylvania was caused by an unseasonably dry summer. Forty-four states raised grapes in quantities.

(S. O. R.)

Graphite. Exports of graphite from Chosen have been increasing rapidly, and reached 86,531 short tons in 1939, with 1940 not reported; almost the entire exports have gone either to Japan or to Japanese-controlled territory. Mexican exports rose sharply in 1940 to 14,551 short tons, all to the United States. Exports from Ceylon in 1940 were 24,028 long tons, an increase of 8% over 1939, but average value increased by 58%. Shipments were mainly to Great Britain, the United States and Japan. During the first three quarters of 1940 shipments to Japan were as large as to Great Britain, but in the last quarter these were cut heavily in favour of Great Britain and the United States. There was increased demand for Madagascar graphite during 1940, but no statistical information was received after 1938, and the same was true for all the European producing areas, which were under German control.

Canada produced a small tonnage of graphite up to 1939; there was no mining in 1940, but there was some recovery from discarded tailings from former years. Although no production data were reported, there was production of graphite in 1940 in the United States at Carson City, Nev., Coosa county, Ala., and St. Lawrence county, N.Y. Imports into the United States were 31,528 short tons, an increase of nearly half over 1939, which in turn was the largest since 1929. (G. A. Ro.)

Graser, Earle W. (? –1941), U.S. radio actor, known as the "Lone Ranger," whose voice was known to an estimated 15,000,000 radio listeners, was born in Kitchener, Ont. In 1933 he was selected among five candidates for the role of the "Lone Ranger," a hard-riding, gallant cowboy hero of a radio script whose adventures thrilled millions of American youth. The studio shrouded him in mystery and his identity was not known until his death April 8 in a motorcar crash in Farmington, Mich., where he made his home.

Grauert, Ulrich (? –1941), German colonel general and air force commander, attended military school in Potsdam and in 1909 joined the artillery division as ensign. During World War I, he became commander of an air force detachment, was promoted to colonel in 1934, and was then transferred to the new reichswehr air force and put in charge of various flying schools.

After the campaign on the western front in 1940, he was promoted by Adolf Hitler to the rank of colonel general. A pioneer in developing the modern air force under Hermann Goering, Grauert distinguished himself in both the war in Poland and the campaign on the western front. With Major General Wolfram von Richtofen, he led the Stuka assaults on the British forces evacuating Dunkirk; he also played a leading role in the battle of Britain. The German high command announced on May 24 that Grauert was killed in action. Official sources indicated that he was killed while in an air raid over Britain.

Gravel: *see* SAND AND GRAVEL.

Great Britain & Northern Ireland, United Kingdom of.

This comprises the main island of Great Britain, with numerous smaller islands off the English and Scottish coasts, and the six northeastern counties of Ireland. It is a constitutional monarchy, with a king and a parliament of two houses, the house of lords consisting of about 670 hereditary peers, 24 spiritual peers, 16 Scottish representative peers, a number of Irish representative peers (in 1940, 14; vacancies were not filled in 1941) and a few life peers who have held high judicial office; and the house of commons, numbering 615 members, elected by a practically universal suffrage. Flag, the Union Jack, consisting of a red cross on a white field (for England), surcharged on a diagonal red cross on a white field (for Ireland), surcharged in turn on a diagonal white cross on a blue field (for Scotland). Ruler: King George VI (*q.v.*); premier: Rt. Hon. Winston S. Churchill (*q.v.*); established church: Protestant Episcopal.

Area and Population.—Area 93,991 sq.mi.; pop. (est. June 30, 1939) 47,680,500 (England and Wales 41,375,000). Chief towns (pop. est. June 30, 1938): London (cap.), city and metropolitan police districts, 8,700,000; city and metropolitan boroughs only, 4,062,800; Glasgow (June 30, 1939), 1,131,500; Birmingham, 1,041,000; Manchester (including Salford), 932,300; Liverpool, 827,400; Sheffield, 520,000; Leeds, 494,000; Edinburgh (June 30, 1939), 473,200; Belfast (Jan. 1, 1939), 443,500.

History.—The United Kingdom's history in 1941 is the history of its war effort, all its activities being in one way or another directed to the prosecution of the war.

The War in Africa.—The warfare of 1940 had presented a comparatively simple picture. From the Norwegian campaign of April to the air battle of Britain in the autumn, a series of distinct and decisive episodes had followed one another, with brief intervals but also almost without overlap, like the acts of a classical tragedy. The year 1941 presented no such simple and easily memorized picture. When the year opened, the small army of General Sir Archibald Wavell (*q.v.*), its striking force never more than 30,000, was already embarked on its brilliant campaign in Cyrenaica. Bardia fell on Jan. 5; Tobruk, Derna, Cyrene followed and finally Bengasi on Feb. 6. Marshal Graziani's army, which was to have closed the Suez canal, had ceased to exist. Italy's entry into the war had enabled the British and Australian forces to make a heartening rejoinder, on however small a scale, to Hitler's conquest of France in the previous summer. The campaign offered a model for the co-operation of land, sea and air arms. Meanwhile the conquest of the Italian empire in East Africa had begun. Kassala, previously occupied by Italian forces within the Sudan border, fell on Jan. 19, Agordat on Feb. 2, Mogadishu, capital of Italian Somaliland, attacked from Kenya, on Feb. 26, Berbera in British Somaliland was reoccupied on March 17, Cheren in Eritrea fell after a very stubborn defense, and Harar in Abyssinia on March 27, Addis Ababa on April 6. The Emperor Haile Selassie returned to his capital May 5, and the duke of Aosta, after a far more creditable resistance than that offered by Graziani, asked for an armistice May 18. A few isolated Italian strongholds remained, but the last of these—Gondar—surrendered Nov. 27. The British forces were then completely released for service in the Mediterranean area, where the empire forces, less than 100,000 at the time of the collapse of France, amounted to 500,000 or more late in 1941.

But there had already been a setback which looked at one time more serious than it later proved. On Feb. 17 a skirmish between British and German mechanized units was reported at El Agheila, in the desert which separates Cyrenaica from Tripoli. On April 3 the Germans surprised and occupied Bengasi. Ten days later they were on the Egyptian frontier, though British and empire forces still held Tobruk. This proved the sum total of the success of the axis. Tobruk was held and its siege was lifted in December, shortly after the British forces began their second major offensive against Libya Nov. 18. This campaign, marked by a series of gigantic tank battles in the desert, had regained all Cyrenaica for the British by the end of the year.

The Balkans.—The reverse in Libya was in part explained by the diversion of British forces to aid Greece. Hitler opened war on Greece and Yugoslavia April 6; Salonika was occupied April 9, and Yugoslavia was out of the war except for unconquered guerrilla forces, on April 17; before the end of the month Greece was subdued. The British government sent a force of about 60,000 from Africa to support the forlorn hope of Greece. This force inflicted tremendous casualties, and three-quarters of it was successfully evacuated, part of it being retained in Crete under the New Zealander General Freyberg. The German attack upon Crete followed on May 20 and accomplished its purpose in the course of a battle, without precedent in the technique of warfare, which lasted ten days. The German attack by sea was entirely defeated with heavy loss, but without adequate aerodromes it was impossible to defeat the German invasion by air. About half the British force of nearly 30,000 in Crete was evacuated.

Iraq and Syria.—Meanwhile German intrigues had secured a pro-German revolution in Iraq (April 3), and the government of Rashid Ali protested (May 1) against the reinforcement of British troops in the country, though this was in accordance with the Anglo-Iraqi treaty. The Iraqi campaign and the overthrow of Rashid Ali were completed within the month of May. But Iraq led on to Syria, because the Germans, with Vichy-French connivance, had been using Syrian aerodromes on their way to Iraq. With the fall of Crete (which coincided with the completion of the Iraqi campaign) it was obvious that the Germans might well have more extended uses for Syria if it was left in the subservient control of General Dentz. British and Free French forces entered Syria on June 8. Hopes that a considerable part of the French garrison would prove friendly, and that heavy fighting would be avoided, were disappointed. The campaign lasted a month and was concluded on July 9 with the surrender of the province and all its garrisons.

ITALIAN PRISONERS, identified by large red circles on their backs, helped British farmers harvest their fields in 1941

Russian Campaign.—The small Syrian campaign coincided with the opening stages of the greatest land campaign of the war. Hitler attacked the U.S.S.R. June 22, and the British prime minister took the first available opportunity of declaring, by broadcast, that Britain would render the U.S.S.R. all the assistance in her power, this announcement coming all the more effectively from a statesman notable since 1917 for his detestation of the theory and practice of communism. The Anglo-Russian treaty of alliance was signed July 13 and plans for British assistance, by munitions and otherwise, to the U.S.S.R. began to be explored. Plans were further elaborated at an Anglo-Russo-U.S. conference in Moscow during the opening days of October. The valour, skill and material resources of the Russian defense far surpassed the expectations of the great majority of people in Britain. Geography in this war as in World War I interposed formidable obstacles in the way of direct support. The most overt example of Anglo-Russian co-operation was their joint intervention in Iran (Persia) in the last days of August. German agents were swarming over the country. In German hands Iran could have been a base for attack on the U.S.S.R., Turkey, Iraq or India. In Anglo-Russian control it provided a channel through which British and U.S. supplies could reach the U.S.S.R. The Allied occupation was followed by the flight of the pro-German shah.

The War at Sea.—All these campaigns, so far as the British part in them was concerned, were small-scale warfare by modern standards. The greater part of the British army remained in the British Isles, not only training but playing an essential part in the war in that, along with the air and sea defenses, it frightened Hitler off the only course of action by which he could secure the quick victory he so often promised his people. The navy on the other hand was working at full stretch all the time. After the air invasion was defeated in the autumn of 1940, it was recognized that the battle of the Atlantic was the most crucial aspect of the war. Hitler, like Napoleon, had failed for the time being in the preliminaries of a direct invasion, and was attempting "circumfamination," to borrow a barbarous but expressive term from a mediaeval chronicler. The sinking of British, Allied and neutral shipping by enemy action rose to figures in the neighbourhood of 500,000 tons in April and May, but dropped thereafter very decisively. In July, August and September the shipping tonnage sunk by enemy action was only a third of that sunk in the three previous months, and the shipping losses of July and August amounted to less than a third of the enemy tonnage destroyed by Britain and her Allies in the same months. This, as Churchill claimed, was an extraordinary achievement in view of the fact that enemy ships confined themselves to short coast voyages, whereas British ships carried on a gigantic world-wide trade, with never less than 2,000 ships at sea and never less than 400 in the danger zone. In the latter part of the summer the average losses of ships in convoy were no more than one in 240, and the average weekly imports were 850,000 tons. The increased food rations introduced in the autumn were no doubt in part a result of these achievements.

The work of a navy, even more than that of an army, may be

compared with an iceberg, of which the part visible above the waterline is only one-ninth of the whole. A far smaller fraction of the arduous toil of the navy, from battleship to minesweeper and submarine, is enlivened with the zest of battle conditions, and of such actions only a small number can be mentioned here.

In January German dive bombers from Sicily attacked a British convoy bound for Greece in the Sicilian channel and damaged the cruiser "Southampton" so seriously that it had to be sunk. In February naval units bombed Genoa and early in March raided the Lofoten islands off the northern coast of Norway, destroying the fish oil plant there and bringing away both German prisoners and Norwegian volunteers. At the end of the month the fleet of Admiral Sir Andrew Cunningham (*q.v.*) destroyed, without loss to itself, a considerable part of the Italian navy off Cape Matapan. It is possible that the Italian fleet was, on this occasion, acting as a decoy to enable an important German convoy to cross to Tripoli—with results already recorded. If that be so, the British navy had its revenge by destroying an enemy convoy in the Sicilian channel on April 16. Other convoys later in the year suffered a similar fate in the same waters. In the last week of May the royal navy suffered some serious losses from air attack while defending Crete from invasion by sea, but here again the balance was almost at once redressed elsewhere; for the sinking of the "Hood" in Icelandic waters was followed by the memorable hunt and destruction of the "Bismarck," reputed unsinkable, on May 27. But late in the year the navy suffered severe losses. "Ark Royal," the aircraft carrier which German claims had repeatedly "sunk," was finally sent to the bottom by a torpedo in the Mediterranean near Gibraltar in November. And shortly after Japan entered the war against Britain and the U.S.A. Dec. 7, Japanese planes sank the new capital ship "Prince of Wales" launched in 1939, and the battle cruiser "Repulse," off the eastern coast of Malaya.

Air Warfare.—In air warfare the spring witnessed a renewal of the indiscriminate night bombing of densely populated areas which had constituted the enemy's principal air activity in the previous autumn. London and the Clydeside, Plymouth, Bristol, Liverpool and Hull were among the chief victims, and the fatal casualties averaged 5,000 for each of the months March, April and May. Thereafter, owing no doubt to the demands of the Russian campaign, German air attacks on Great Britain petered out, except for occasional small-scale raids. The British air force, on the other hand, continually extended the daring and the weight of its attack on all enemy objectives, attacking by day as well as by night. These results were not secured without casualties, but the losses were insignificant compared with those suffered by the German raiders in the autumn of 1940.

Civil Defense.—In Britain itself a number of steps were taken to reduce, in one way and another, the discomforts of air-raid precautions and the damage done by the raids. Shelter accommodation was enormously improved, in quality and quantity. After the largely preventable damage done by the incendiary raid at the end of Dec. 1940, fire-watching was made a compulsory service, the compulsion to be applied wherever volunteer organization fell short—a typically British compromise, the adequacy of which had not been severely tested by the end of 1941. The government carried a War Damage bill, establishing compulsory schemes for the insurance of buildings and industrial and commercial equipment all over Britain and a voluntary scheme for the insurance of private chattels. The mere existence of such a scheme was proof of the fact that air-raid damage could be regarded as a more or less measurable risk.

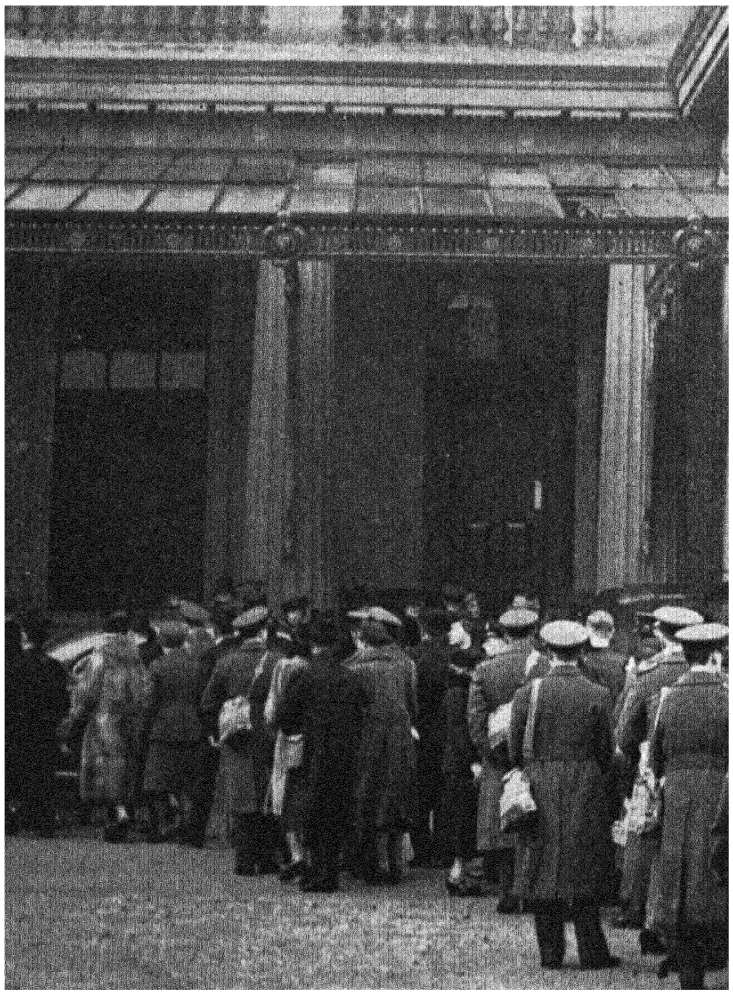
War Industry.—The Fire Watchers order was the first example of the use of the government's powers, entrusted to it by parliament, to conscript service for nonmilitary purposes. Many had demanded that the same principle should be applied on a wholesale scale to industrial labour, but Ernest Bevin (*q.v.*), the minister of labour, being well acquainted with the trade union world from which he came, preferred to be a leader rather than a dictator. Employers in certain industries were prohibited by the Essential Work order from dismissing workers and workers were prohibited from giving notice, except with the consent of the ministry of labour. Certain age groups of men and women were ordered to register and were thereby liable for war work on government order, but only a small proportion of those registered were called up in 1941. There was a good deal of criticism of the achievement of the government in securing, or failing to secure, the maximum output of all forms of war material. In so vast and so rapidly improvised an organization weak spots were easily found and easily given undue prominence. Criticism was focused in a house of commons debate on production, the lead among the critics being taken by Sir J. Wardlaw Milne. The prime minister replied a week later. He did not claim that all was perfect but sought to show that the critics had painted a misleadingly gloomy picture; he also decisively rejected the idea of a super-man colleague to control the whole "industrial front."

The Budget.—Sir Kingsley Wood's budget was acclaimed as the first to face squarely the financial facts of the war; £250,000,000 was to be raised by additional income tax, half of it by raising the basic rate from 7*s.*6*d.* to 10*s.*, and half by reductions in the family allowances. These latter subtractions from the taxpayer's income were to be of the nature of a forced loan repayable with interest after the end of the war. The chancellor thus accepted, up to a point, the principle of compulsory saving advocated a year earlier by J. M. Keynes. The plan of collecting income tax on salaries and wages at the source, enacted with the previous budget but coming into force not long before the beginning of 1941, proved a boon to taxpayers as well as to the government. Criticism of the 100% excess profits duty as destroying the producer's incentive to economy was met by somewhat roundabout devices, the government being unwilling to abandon a principle so superficially attractive to all who had no chance of earning excess profits.

U.S. Relations.—Support from the United States was of the nature of a steady crescendo in 1941. The milestones in the U.S. advance toward co-operation prior to American entry into the war Dec. 8 were the president's message to congress, foreshadowing the Lend-Lease bill on Jan. 6, 1941, the enactment of that measure in March, followed by prompt presidential action giving practical effect to its provisions; the announcement at the end of April that the U.S. navy, without actually convoying flotillas across the Atlantic, would establish patrols supplementing the work of British convoys—a step which was doubtless responsible in part for the big reduction in shipping losses from June onwards; and the meeting of President Roosevelt and Prime Minister Churchill, at President Roosevelt's invitation, which resulted in the eight-point statement on joint postwar policy known as the Atlantic charter, in August.

Relations with the U.S. were closer than ever after the treacherous attack on Pearl Harbor and the subsequent U.S. entry into the war. The year ended with victorious advances in Africa and in the U.S.S.R., Britain's other great ally. But it ended also with anxious situations in the far east, where Hongkong had fallen, and large sections of Malaya and the Philippines had been overrun by the Japs.

Northern Ireland.—As for Northern Ireland, it may be said that never in its history, not even at the time of Londonderry and the Boyne did she occupy a position so crucial to the cause of world freedom as in 1941. In World War I Britain had full use of all Irish facilities for the defense of her Atlantic approaches. In



AT AN INVESTITURE in Buckingham palace in Feb. 1941, King George decorated British soldiers, sailors and civilians for conspicuous acts of bravery. Recipients of medals are shown lined up before the palace, awaiting their decorations

World War II the use of neutral Eire has been denied her. It is therefore through the narrow waters of the North channel that the bulk of British shipping must make the western ports of Britain under the protection of the navy and air force, which can operate effectively in those waters mainly because the six counties of Northern Ireland are still loyal to the British crown. Without a bridgehead in Northern Ireland Britain's most vulnerable flank would be turned. The government of Northern Ireland expressed a wish for the application of conscription to their province but reluctantly withdrew it at the desire of the British government, which foresaw complications with Eire. The war has inevitably widened in some respects the gulf between the two Irelands; yet not wholly so, for the prompt and gracious assistance rendered by Dublin to Belfast, after the latter had suffered air bombardment in April and May, was deeply appreciated. (D. C. So.)

Education.—In 1937–38: elementary, England and Wales—departments under separate head teachers 29,988, scholars on register 5,150,874; elementary, Scotland—schools 2,895, scholars 617,047; elementary, Northern Ireland—schools 1,700, scholars 191,862; secondary, England and Wales—grant-aided schools 1,398, scholars 470,003; secondary, Scotland—grant-aided schools 252, scholars 156,645; secondary, Northern Ireland—grant-aided schools 75, scholars 14,557; universities, students: England 41,707 (full time 36,378); Wales 3,089 (full time 2,970); Scotland 10,384 (full time, 9,841); Northern Ireland 1,590 full-time students.

Banking and Finance.—Revenue, ordinary (actual 1940–41) £1,408,867,000; expenditure, ordinary (actual 1940–41) £3,884,288,000; public debt (national) March 31, 1941, £11,394,566,000, exchange rate 1941, £1=403.5 cents. (*See* Table I and BANK OF ENGLAND.)

Greece. A kingdom in the southern part of the Balkan peninsula, under German and Italian occupation in 1941. Area 50,147 sq.mi., of which 41,328 are mainland; pop. (census May 16, 1928) 6,204,684; (estimated, 1940) 7,150,000.

Capital, Athens (392,781). Chief cities: Thessaloniki (236,524); Patras (61,278); Cavalla (49,980); Candia (33,404); Corfu (32,221). Religion: mostly Greek Orthodox; 126,017 Mohammedans, 72,791 Jews. King: George II (*q.v.*); prime minister: Emmanuel Tsouderos.

History.—The year 1941 was a tragic one in the history of Greece. The country had been involved in war through Italian aggression on Oct. 28, 1940.

By the beginning of 1941, the heroic resistance of the Greeks had not only driven the Italian armies, in spite of their great superiority in numbers and material, beyond the Greek frontiers, but the Greeks had succeeded in occupying the southeastern and eastern part of Italian-dominated Albania, including such important towns as Kortcha and Argyrokastro. From this moment on the Greeks were able to expand slowly their grip on Albania and to repel all Italian counterattacks with great losses for the aggressor.

The main struggle centred around Tepeleni. A blow was dealt to Greek leadership, however, when General John Metaxas (*q.v.*), who had established a military dictatorship in Greece Aug. 4, 1936, and whose military knowledge had prepared the country for its successful defense, died Jan. 29 after a very short illness.

Alexander Korizis (*q.v.*), governor of the national bank, was appointed in his place. He had never been active in politics, but was held in high esteem as an administrator by Metaxas and was expected to continue the former's policy. Under his leadership the Greeks continued their successful efforts to defeat the Italians, in spite of the fact that Signor Mussolini himself took over the command of the Italian troops in Albania and ordered a powerful counteroffensive. The Greeks were cheered by British support.

At the beginning of March the British foreign secretary, Anthony Eden (*q.v.*), and the chief of the British general staff, Sir John G. Dill, visited Athens, and it was announced that the two countries found themselves in complete agreement on all points of the situation. The Greek government tried, as it found itself faced with the danger of a sudden German attack through Bulgaria, to come to an agreement with Yugoslavia and Turkey for a common defense of the liberties of the Balkan peoples. Turkey and Greece were bound to mutual assistance by a treaty of Sept. 1933, which pledged the use of military force in a common defense of their frontier in Thrace.

But although Turkey declared her full sympathy with Greece, no help came from there. On the other hand Yugoslavia, after the overthrow of its government which had signed a treaty of friendship with Germany, resisted the German plans of domination of the Balkans, but the resistance of the not sufficiently prepared Yugoslav army proved of no avail, and its debacle hastened the debacle of the Greek army under the onslaught of the German armies who attacked through Yugoslavia. Though the Greeks foresaw clearly that Germany's entry into the war might spell the doom of Greece, the foremost Greek journalist, George Vlahos, warned Germany on March 8 that Greece "will show the world how to die as she has shown how to fight."

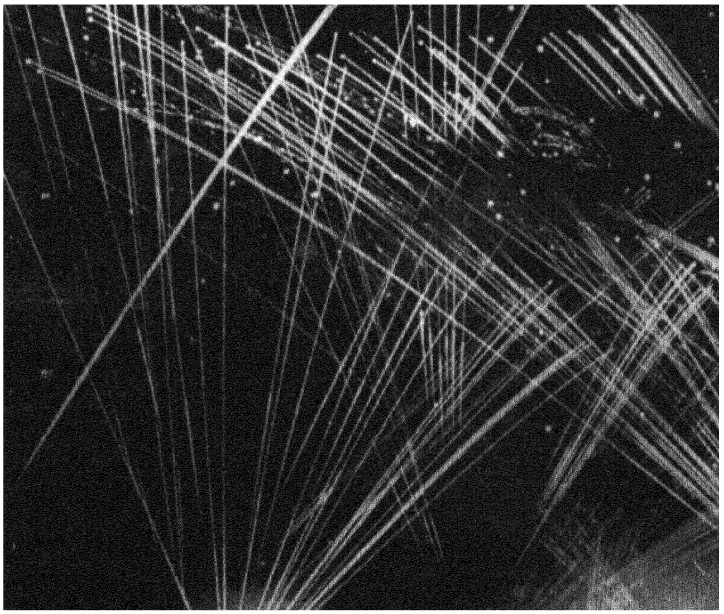
Premier Korizis emphasized in a speech to the Greek youth on March 24 that "Greece is giving an example in leading the way toward freedom for the rest of Europe. We are struggling not only for our own integrity, but for the good of the whole world, in order to help raise humanity. We will die if necessary." When on Sunday, April 6, German legions from Bulgaria attacked Greece and at the same time broke through the southeastern Yugoslav defenses, thus opening up the Vardar valley for a German advance, the Greek army in Thrace and eastern Macedonia found itself cut off and Thessaloniki was soon occupied by the Germans. The British who came to the help of the Greeks fought valiantly on their side but were greatly outnumbered, especially in planes and tanks, and had to withdraw, so that the Greek army in the Epirus had to abandon Albania to the Italians. Under these tragic circumstances Premier Korizis committed suicide on April 18. A provisional military cabinet under the king as premier and with Emmanuel Tsouderos as foreign minister was formed, after Kostas Kotzias, a former military governor of Athens, and General Alexander Mazarakis, a former war minister, had failed to form a war cabinet. On April 21, Tsouderos became prime minister. He was one of Greece's leading economists and a native of Crete. On April 23, however, the high command of the Greek army under General Tsolakoglou surrendered.

The surrender came while British troops were still fighting in the historic pass of Thermopylae. Under this condition the government had no choice but to evacuate the Greek mainland and to withdraw to the island of Crete. Most of the British troops also succeeded in evacuating the mainland. By the end of April the whole of Greece with the exception of Crete was in German hands (*See* WORLD WAR II).

Greek freedom, at least temporarily, was extinct. The swastika flew over the Acropolis. Though a Greek puppet government under General Tsolakoglou was formed in Athens, the Greek population kept up the spirit of resistance.

The northeastern part of Greece, Macedonia and Thrace, were occupied by Bulgarian troops and administered in a most oppressive way by Bulgaria, while the rest of the country was occupied

A CRISS-CROSS PATTERN of search-lights and tracer shells lighted the sky of this Greek city in April 1941 as British and Greeks strove to drive off German bombers



mainly by Italian troops. Few of the Greeks were ready to cooperate with the invaders. The most important among them were Dr. Constantine Logothetopoulos, a physician, and the small Ethnikon Sozialistikon Kommatos or national socialist party under the journalist Yannaros and Captain Spyros Botsaris.

Meanwhile the Greek government and the British forces in Crete were exposed to an air-borne attack upon the island which began on the night of May 19–20 and forced the British, after 12 days of fierce resistance, to evacuate the island, after having suffered great losses. The king of Greece and the cabinet reached Egypt, and in September a new Greek cabinet, headed by Emmanuel Tsouderos, was formed as a Greek government-in-exile in London. Admiral Alexander Sakellariou continued as vice-premier in the middle east.

Education and Finance.—In 1937 Greece had 8,159 elementary schools with 967,588 pupils, and 408 high schools with 78,843 pupils. The governmental expenditure for education amounted to 1,012 million drachmai. There were two universities and one institute of technology in Athens, and one university in Thessaloniki in addition to several specialized schools of higher learning.

The monetary unit was the drachma (= approx. 0.67 cent U.S. in 1940), which had been stabilized in 1928 at 77.02 drachmai to the dollar, but the stabilization had been suspended in April 1932. For the year 1939–40 revenue was estimated at 14,014 and expenditure at 14,653 million drachmai. The total national debt amounted at the end of 1938 to 52,140 million drachmai. On Dec. 31, 1939, the total bank note circulation was 9,453 million drachmai. There were 29 banks in Greece with a capital of 1,970 million drachmai and deposits of 17,371 million drachmai at the end of 1936.

Trade, Communication, Agriculture, Minerals.—The value of imports amounted in 1939 to 12,275, that of exports to 9,199 million drachmai. Chief articles of export were fruit and tobacco, oils and waxes, and mineral products; chief articles of import were metals and metal articles, foodstuffs, yarns and textiles, and mineral products.

In 1939 the chief importers to Greece were Germany, Great Britain, Rumania and the United States; the chief exporters from Greece were Germany, the United States, Great Britain and Italy. Railways showed a mileage of 1,668 mi., while there were 8,440 mi. of roads.

There were 1,368 post offices, 37 telephone offices, with 38,427 subscribers and 23,976 km. of telegraph lines.

Greece is chiefly an agricultural country, although the mountainous character leaves only a small part cultivated. Olives and fruit are produced in great quantities and good quality. The industrial development had started after World War I. There are mines of iron ore, iron pyrites, magnesite, chromites, emery, lead and lignites. (*See* also ALBANIA.)

(H. Ko.)

Greenland. The world's largest island (736,518 sq.mi., some 705,000 covered by glacier), in the North Atlantic ocean, N.W. of Iceland. A Danish possession, it came under the United States protection in 1941. Capital, Godthaab. A population of about 18,000 (est. 1941) is scattered in small settlements on the west coast, and 1,000 on the east coast, about 600 in all being Danes, the rest native Greenlanders.

Seats of the governors are Godhavn in the north and Godthaab in the south.

History.—The very frigidity of "Greenland's icy mountains" makes the island of vital concern for meteorological purposes. From its stations the weather of Britain and the whole north Atlantic region can be predicted. And weather knowledge is important for bombing.

Also in Greenland bases can be set up from which to attack or protect Atlantic shipping.

Greenland could no longer live by itself after the start of World War II in 1939. In 1940 people had begun to reread the Monroe Doctrine, had found that it laid a protective mantle over north as well as south, and the U.S. sent a consul to Godthaab.

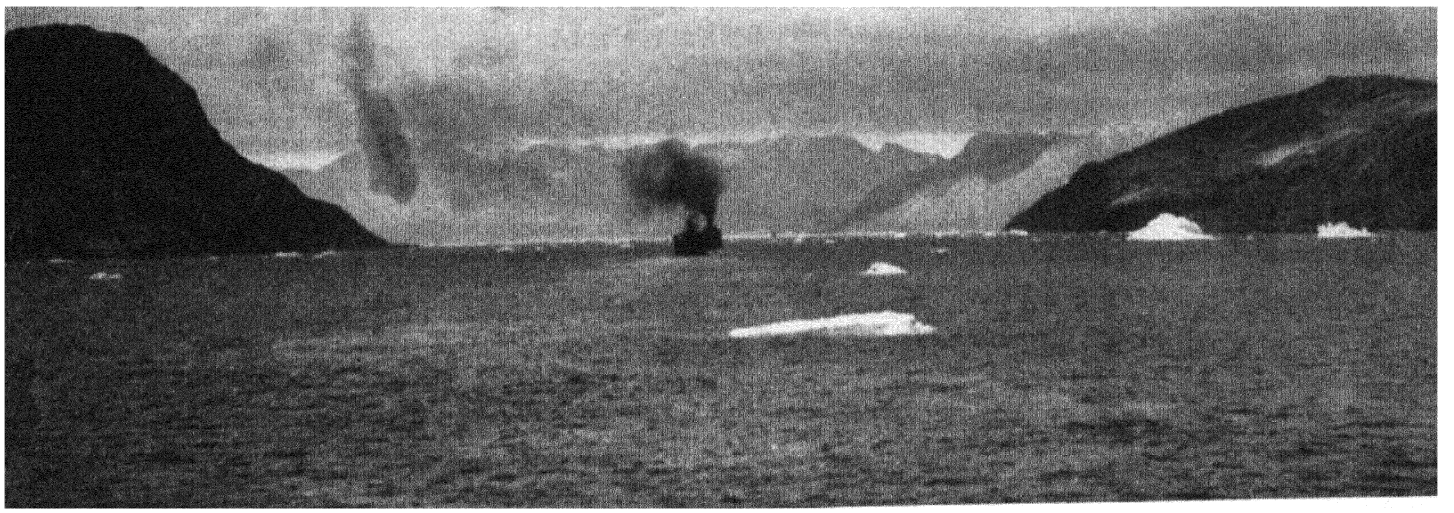
In March 1941 the Germans extended their declared "war zone" to Greenland's three-mile line. A few days later the U.S. consul reported a nazi bomber over Greenland, then another war plane. Within two weeks (April 9) Danish Minister Henrik de Kauffmann signed the following agreement with United States Secretary of State Cordell Hull:

(1) The United States reiterated recognition of Danish sovereignty over Greenland.

(2) The United States obtained the right to build bases for planes, radio and weather stations, and to "do any and all things necessary" to hold these positions.

(3) The agreement was to stand "until the present dangers to the American continent have passed."

GREEK PEASANT TROOPS on the Albanian front in the winter of 1940–41 cooking a meal and warming their hands



A U.S. TROOP CONVOY steamed up a fjord in Greenland early in July, 1941 to land the first forces of occupation, three months after President Roosevelt announced the protectorate April 10, 1941

Virtually, the United States had established a temporary protectorate over Greenland. The Germans roared a protest, and the nazi-controlled government of Denmark voided the agreement and recalled the minister. De Kauffmann, however, stayed on in Washington. He admitted that he had acted without orders, only "in the interests of the king of Denmark," and that the government knew nothing of the agreement until it was a *fait accompli.* The significant fact was that the United States and a "free Dane" official had made a far-reaching decision.

Trade and Finance.—Exports (largely fish and fish products) in 1939 totalled 1,847,000 kronur (1 krón = 18c U.S. in 1939), exclusive of export of 56,455,300 kg. of cryolite. Imports in 1939 totalled 4,149,000 kr. and consisted chiefly of foodstuffs (607,000 kr.), wood (468,000 kr.), manufactures (451,000 kr.), fruits and other colonial wares (389,000 kr.), meat (253,000 kr.).

The government budget for 1939–40 was balanced at 6,035,000 kr.

(F. D. S.)

Griffith, John Price Crozer (1856–1941), U.S. pediatrician, was born Jan. 5 in Philadelphia. A graduate of the University of Pennsylvania in 1877, he became a member of the university's faculty in 1889. In 1913 he was appointed professor of pediatrics, a post he held until a short time before his death. Dr. Griffith was also president of the board of trustees of the Baptist orphanage, Crozer Theological seminary, established by his mother's family at Chester, Pa. Among his works are: *The Care of the Baby* (1895); *Diseases of Infants and Children,* published in 2 vols. in 1919 and in one vol. in 1933. Dr. Griffith died at Devon, near Philadelphia, July 28.

Grindell-Matthews, Harry (1880–1941), British scientist and inventor, known as "Death Ray Matthews," was born March 17. After studying under private tutors and at the Merchant Venturers' college, Bristol, England, he saw service with British troops in the Boer war in 1899. Interested in wireless telephony, he built a sending station in Cardiff in 1911 and there established wireless communication for the first time with a plane in flight. Among the many inventions credited to Grindell-Matthews were automatic pilots for planes; submarine detecting devices, 1915–17; and the "luminaphone," an organ played by light, 1926. He was reported to have invented a "death ray" that would bring down aeroplanes at a distance, another ray to kill disease germs and a rocket plane that could travel six miles a second. During later years he was reported working on a scheme for aerial defense by means of "mining the air" with bombs rocketed up 30,000 ft. and suspended from parachutes by thin wires. He died of a heart attack Sept. 11 in his laboratory on a mountain top near Swansea, Wales.

Guadeloupe: *see* FRENCH COLONIAL EMPIRE.

Guam. A possession of the United States of America and the largest and most populous island of the Marianas, Guam lies at the southern end of that group, approximately 1,500 mi. E. from Manila; area about 225 sq.mi.; population, July 1, 1941, 23,394, including 21,994 natives called Chamorros; the remainder are foreign-born or personnel of the naval establishment. Agana, with a population of 11,000, is the capital and only city of Guam, which was occupied by Japanese forces in Dec. 1941.

History.—The island was discovered by Magellan March 6, 1521, and remained a Spanish possession until June 21, 1898, when it was captured by the United States. Later it was ceded to the United States by the treaty of Paris, and after its acquisition was under the jurisdiction and control of the navy department, with a naval officer, commissioned as governor by the president, acting as chief executive of the island.

Guam was attacked from all sides by Japanese naval forces Dec. 8, 1941 (Dec. 7 east of the international date line). It was defended by a small force of approximately 555 U.S. sailors and marines, plus a group of some 1,100 construction workers who seized whatever weapons were at hand. The Japanese made a landing near Agana Dec. 10 and claimed control of the island shortly thereafter. The U.S. navy department acknowledged loss of the island Dec. 13.

Education.—During 1940–1941 the public schools had an average enrolment of 5,082. All instruction was in the English language, with special attention given to health and sanitation and to industrial and agricultural training. Health and sanitary conditions are very satisfactory.

Agriculture.—Typhoon damage to the coconut crop curtailed copra export to 193,391 lb. for the fiscal year 1940–41; the value was $73,763. Total exports were $84,278; imports, $994,010. Guam is an agricultural community; soil is fertile and native foodstuffs plentiful.

Guatemala. Second largest and most northerly of the Central American republics. Area, 48,290 sq.mi.; pop. 3,284,269, of whom 65% are Indians. The chief cities (with 1938 official est. pop.) are: Guatemala City (capital, 166,456); Cobán, (45,919); Quezaltenango (41,858); Totonicapán (40,900); Antigua, (40,000) (unofficial estimate); Jutiapa (31,723); Quiché (30,945); Zacapa (30,113); Jalapa (28,717); Chiquimula (27,581); Escuintla (26,985). President in 1941: General Jorge Ubico.

History.—The year 1941 in Guatemala was dominated by national and hemispheric defense, capped by formal declarations of war on Japan (Dec. 7) and on Germany and Italy (Dec. 11). For the second time since Pres. Ubico's first inauguration in 1931, a constitutional assembly extended the president's term by six years, to March 1949. War preparedness measures included strict licens-

ing of strategic mineral exports, establishment of a school of modern military tactics, deportation of the *Transocean* nazi news agency correspondent in Guatemala, and expulsion of German consuls and withdrawal of Guatemala's from Germany. The United States blacklist of axis firms in Latin America resulted in a boycott of German business, especially of coffee producers, in September. Funds of the German-owned coffee plantations, about half of all the country's total, were "frozen."

Education.—Guatemala had, in 1941, more than 2,500 schools, with an enrolment in excess of 145,000 pupils. The 1941–42 budget for education was $1,077,000, third largest government expenditure.

Defense.—Military service is compulsory. The army, numbering 7,000 men in early 1941, was being increased rapidly. The defense budget for 1941–42 was $1,900,000, the largest single government expenditure.

Finance.—The monetary unit is the quetzal, equal in value to the United States dollar. The 1941–42 budget presumed balancing of revenues and expenditures at $10,223,000. The national debt as of Dec. 31, 1940, was $10,341,000, of which 60% was in sterling bonds, the remainder mostly dollar obligations.

Trade.—In 1940 imports amounted to $12,666,970 (1939: $15,295,729), exports $12,039,000 (1939: $16,985,310). In the first half of 1941, imports declined 12.1%, while exports rose 19.8%. The United States supplied 74% of the imports and took 91% of the exports in 1940. Coffee made up 45% of all export values in 1940, against 56.2% in 1939, bananas (a 20.2% decline) 42.9% (1939: 32.3%), chicle 15,052 quintals (of 101.43 lb.) 5.3% (4.6%), mahogany and other woods 0.9% (1.0%). Honey, vegetable oils, zacatón root and hides followed in importance.

Communication.—Steamship and air service are the chief means of external communication, although the nearly completed Inter-American highway was increasing in importance in 1941. Guatemala had 539 mi. of railway (not including private banana lines) and 6,419 km. of highway in 1941, with 816 km. of highway under construction and 385 km. projected.

Agriculture.—Guatemala, essentially an agricultural country, depends upon two main money crops, coffee and bananas, although chicle is growing in importance. The 1940–41 coffee crop was estimated at 843,480 bags. Under the Inter-American Coffee agreement, a quota of 593,557 bags was placed on 1941–42 exports to the United States (1940–41: 558,593 bags). High winds damaged the banana crop somewhat in 1941, and shipments in the first nine months were reduced some 20% to 5,404,467 stems. The 1941–42 chicle crop, the best in some years, was estimated at 3,800 tons (2,500 tons in 1940–41). In the season 1939–40, the greatest single crop in acreage was corn, 550,999 manzanas (1 manzana = 1.727 ac.), followed by coffee (158,299), beans (105,674), bananas (49,423), wheat (27,576), sugar cane (21,556) and rice (14,581). Guayule: *see* CHEMURGY: *Rubber;* RUBBER AND RUBBER MANUFACTURE.

Guertner, Franz (1881–1941), German jurist and politician, was born Aug. 26. He was minister of justice in Bavaria from 1922 until 1932, when he became reich minister of justice in the von Papen and von Schleicher cabinets. Guertner was reappointed by Hitler in 1933, although he did not become a member of the nazi party until 1937. In 1934 he promulgated a sterilization law for the unfit that was widely applied in ensuing years. Shortly afterwards he inaugurated the People's court to handle cases of high treason and espionage, a court from which there was no appeal. In addition to the professional magistrates this court had 20 lay judges including Storm troop leaders. One of his most far-reaching decrees required German Jews to raise a billion-mark fine in reprisal for the assassination of Ernst vom Rath, a member of the German embassy staff in Paris, by a Jew in Nov. 1938. He died in Berlin, Jan. 28.

Guggenheim, Simon (1867–1941), U.S. industrialist, was born Dec. 30 in Philadelphia, Pa., one of the seven sons of Meyer Guggenheim, founder of the world-famous Guggenheim mining empire. After studying languages and business in Europe, young Simon went to Pueblo, Colo., in 1888 to help manage the family's smelting and refining plants there. While in Colorado, he took an active role in politics and was U.S. senator, 1907–13. In 1919 he became president of the American Smelting and Refining company, and the Guggenheim holdings throughout the world continued to expand under his administration. In 1925, Guggenheim and his wife established the John Simon Guggenheim Memorial foundation to aid scholars, scien-

Guggenheim Memorial Foundation. The John Simon Guggenheim Memorial foundation granted 104 fellowships with total stipends of $215,000 for the year 1941–42. Of these grants, 78 were awarded to citizens and permanent residents of the United States, 6 to Canadians and 20 to citizens of Argentina, Brazil, Chile, Cuba, Mexico, Peru, Uruguay and Puerto Rico.

Simon Guggenheim (*q.v.*), cofounder with Mrs. Guggenheim of the foundation in 1925, died Nov. 2, 1941. At the time of his death the foundation had an endowment of $8,314,348, all contributed by Guggenheim and his wife. In the period 1925–41, the foundation granted a total of $2,291,535 for 1,123 fellowships. In his will, Guggenheim left almost his entire estate to the foundation as residuary legatee. No estimate of the probable amount of the bequest was available in 1941. Headquarters of the foundation are at 551 Fifth avenue, New York city.

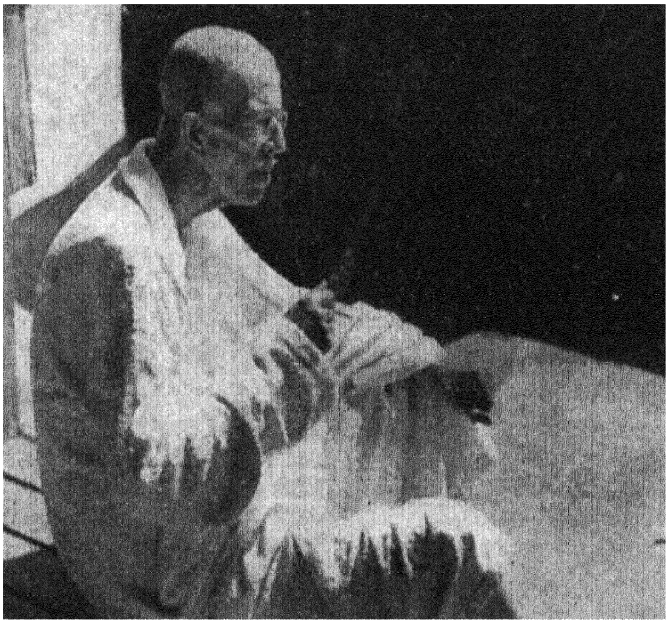
Gunther, Franklin Mott (1885–1941), U.S. diplomat, was born Feb. 28 in New York city and was educated at Harvard and the École Libre des Sciences Politiques in Paris, France. He was private secretary to the U.S. ambassador to Japan in 1908–09 and thereafter served in U.S. embassies and legations in many countries. He was minister to Egypt, 1928–30, retired to devote himself to economic research, 1930–37, and was again named minister, serving in Bucharest, Rumania, from 1937 to 1941. Gunther was president of the American Institute of Iranian Art and Archaeology, 1930–37, and a fellow of the Metropolitan museum, New York city, and the Royal Society of Arts and Manufactures, London. He died at his post in Bucharest, Dec. 22.

Gustavus V (1858–), king of Sweden, of whom a biographical account will be found in the *Encyclopædia Britannica*, ascended the throne in 1907 and in 1941 was Europe's oldest monarch. The nation-wide celebration of his 80th birthday in 1938 was a demonstration of love of the man as



well as of respect for his age. He stood out after 1914 as a leader in the movement for inter-Scandinavian peace and co-operation. But the solidarity meeting held under his auspices in Stockholm in the autumn of 1939 was too late to avert the cataclysm. Throughout 1940 and 1941 he was unquestionably one of the strongest and most consistent influences holding Sweden to a path of neutrality—or at least of nonbelligerency.

(F. D. S.)

Gynaecology and Obstetrics. Mayer says "war amenorrhoea" referred to frequently during World War I had not been demonstrated up to the close of 1941. The apparent decrease in eclampsia during World War I, attributed to decreased protein intake, had not been noticeable. An increase in the incidence of gonorrhoea was noted during both wars.

An outstanding gynaecologic event of 1941 was the release in the United States by the pure food and drugs bureau of stilbestrol for commercial distribution. This synthetic preparation has estrogenic properties or effects, and thus can be used in treatment of menopausal disturbances as a substitute for hormones, extracted laboriously and expensively from animal sources. Its low cost is its chief advantage, as many women suffering from "flashes" and "flushings" of their "change of life" were financially unable to purchase these other necessarily expensive preparations.

A long period of careful clinical investigation before the governmental approval of stilbestrol as a new drug disclosed that certain ill effects, supposedly toxic, were due chiefly to overdosage. This preparation had been available commercially for some time previous to this in Canada and in England.

Endometriosis, or pelvic and intra-abdominal implantation of tissue histologically identical with that lining the uterus, causes extensive and dense formation of adhesions in the lower abdomen, with tubal involvement, and if neglected is followed by sterility and other ailments. It is frequently associated with cystic degeneration of one or both ovaries, and often becomes a ravaging ailment in young women. All gynaecologists agree that its occurrence is increasing. Whereas it was once uncommon, it is seen with constantly increasing frequency in young women between 20 and 35 years of age. It is not common among poor classes of patients. It was suggested in 1941 that its present noticeable increase may be due to late marriage and delayed childbearing, more generally prevalent than formerly.

Liquid petrolatum, or mineral oil, used so extensively as a postoperative lubricant, and for constipation of pregnancy was declared harmful in that it interferes seriously with the utilization of fat soluble vitamins, notably A and D, causes indigestion, interferes with healing of operative wounds in the anorectal region, and contrary to the previous belief that it was merely a lubricant, may be absorbed with resulting symptoms termed "mineral oil poisoning."

Nicodemus recommended oxygen tent therapy to lessen the anoxia and thus lower the maternal and also the infant death rate from eclampsia.

The diagnosis of placenta previa was materially aided both in safety and accuracy by the use of roentgen-ray pictures, utilizing a "soft-tissue" technique, to disclose the location of the placenta. A pregnant woman approaching term may bleed and thus cause her physician to suspect a low implantation of the placenta (placenta previa.) Internal examination for diagnosis is dangerous because this causes further separation and haemorrhage. Innumerable methods have been attempted to visualize the placenta and to determine its location by roentgen-ray, but like other soft tissues the placenta throws little or no shadow to the ordinary roentgen-ray. By means of this new technique it could be quite plainly shown, and diagnosis of placenta previa established or ruled out in nearly all suspected cases.

The relationship between prothrombin activity in the blood of newborn infants, and their likelihood to suffer from bleeding or haemophilic states was studied extensively. The administration of vitamin K to infants with intracranial or other haemorrhages is an active therapeutic measure in increasing the prothrombin activity and thus checking the bleeding. Premature infants are especially prone to such haemorrhages, so that the routine administration of vitamin K to mothers beginning a premature labour was recommended for its prophylactic effect on the premature infant about to be born, transmission of the vitamin taking place readily through the placenta.

Sulphanilamide derivatives, established as a powerful means of combating various infections and used extensively in infections of an obstetric or a gynaecologic nature, were being subjected to an intensive study of their toxic or harmful side effects. In addition to already recognized ill effects, question was raised about their possible injury to the foetus when used for the mother during her pregnancy for some infection, such as a severe pyelitis. It was suggested that foetal anaemia may be caused.

Gypsum. There was an increase of gypsum production in the United States in 1940 amounting to 15%, and totalling 3,699,000 short tons of crude gypsum; sales, however, increased but 7%, to 929,100 tons, as a larger amount was sold as calcined gypsum, the sales of which rose 15%, to 3,704,100 tons. Imports were mostly from Canada and amounted to 1,405,200 tons, 7% more than in 1939. Crude gypsum is used mostly in the manufacture of portland cement, which took 88% of the sales, while agriculture took 10%; sales of calcined gypsum went 53% to building plasters, 28% for lath, 12% for wallboard and sheathing, and 4% for tile. All told, the building industry consumed 97% of the calcined gypsum and 88% of the crude. During the first three quarters of 1941 production of crude gypsum increased 27% over the same period of 1940, to 3,345,100 tons, while calcined gypsum increased 20%, to 2,890,700 tons. These increases were to be attributed largely to the heavily increased building program in connection with defense work.

The only producer of importance outside of the United States for which data were available was Canada, where the output in 1940 was 1,448,800 short tons, most of which was exported to the United States. During the first three quarters of 1941 production rose 2% over the same period of 1940, to 1,116,847 tons. (G. A. Ro.)

Haakon VII (1872–), king of Norway, of whom a biographical account will be found in the *Encyclopædia Britannica*, was born Prince Charles of Denmark, second son of Frederick VIII (and brother of Christian X). Upon the separation of Norway from Sweden he was elected king by the Norwegian storting (Nov. 18, 1905), and took the old Norse name of Haakon, and that of Olav for his son the crown prince. Haakon married Maud (1869–1938), youngest daughter of King Edward VII of England.

Through 1941 King Haakon continued to head the Norwegian government operating in exile in London. He who had stood aside from internal political strife and who had acted with calm heroism through the harrowing days of April, May and June of 1940 was the kind of steadfast rallying point needed by the citizens of Nor-

way at home and in exile. It was he who, in March 1941, officially welcomed to London the 300 Norwegians brought back after the British raid on the Lofoten islands. And it was he who, in October, took the grimmer step of signing a decree providing the death penalty for "tools of the nazis," a warning aimed to bolster the morale of people at home. (*See* also NORWAY.)

(F. D. S.)

Hackett, Horatio Balch (1880–1941), U.S. architect, was born May 8 in Philadelphia, Pa. He graduated from the U.S. Military academy in 1904 and served with the A.E.F. as an artillery officer in World War I. After the war he joined an architectural firm and in 1934 was appointed general manager of the Federal Public Works Emergency Housing corporation. Col. Hackett was director of housing for the Public Works administration, 1934, and assistant administrator, 1935–37. He also served as a member of President Roosevelt's advisory board on allotments, 1935. Col. Hackett was an executive of several large firms before his death in Chicago, Ill., Sept. 8.

Haiti. A West Indian republic occupying the western third of the island of Hispaniola. Area, 10,204 sq.mi.; pop. (1941, approx.), 3,000,000. Haiti is the most densely populated of the Latin American republics. Capital, Port-au-Prince (125,000). Other principal cities are Cap Haitien (15,000), Les Cayes (15,000), Gonaïves (10,000), Jacmal (10,000) and St. Marc (10,000). Religion, Roman Catholic; president (1941) Elie Lescot.

History.—Politically, the main events in Haiti in 1941 centred about the presidential succession. Despite constitutional prohibition of more than two successive terms for a president, the chamber of deputies in March unanimously re-elected Pres. Stenio Vincent for a third term and suggested a plebiscite to obviate constitutional difficulties. Public opinion, expressed in mob protests, was so strongly opposed, however, that Pres. Vincent stepped aside, and Elie Lescot, long Haitian minister to the United States, was elected, taking office May 15.

Agreements with the United States in May and September achieved relaxation of United States fiscal control in Haiti. The functions formerly exercised by a United States fiscal representative were assumed by the National Bank of Haiti.

In December, Haiti responded to the Japanese attack upon the United States with declarations of war against all the principal axis powers, and placed her facilities at the disposal of the United States.

Economic depression marked the early months of 1941—the effect of loss of export markets because of war conditions. To alleviate the financial crisis which followed, the United States agreed to deferment of a third of interest payments on Haitian bonds due April 1. By September, however, a sharp rise in foreign trade had so enhanced national revenues that the deferred payments were liquidated entirely. On May 1 a United States Export-Import bank grant of $5,000,000 was made to further development of diversified production, especially rubber, along with spices and a variety of tropical medicinal and fibrous plants.

On Sept. 16 "lend-lease" goods valued at $1,100,000 were granted by the United States to aid development of Haitian defenses.

Education.—Haiti had some 400 primary and secondary schools in 1941, with 50,000 enrolment. The University of Haiti is at Port-au-Prince. Education was allotted 8.6% of the 1941 budget.

Finance.—The monetary unit is the gourde, fixed by law at 20 cents U.S. Total revenues in the fiscal year ending Sept. 30 were $5,386,000; expenditures, $5,113,200. The public debt on Sept. 30, 1941, was $13,619,200, an increase of 12.5% over the previous year.

Trade.—Imports for the year ending Sept. 30, 1941 totalled $7,431,200, a 6.7% decline, consisting largely of textiles, foodstuffs and manufactured articles. Exports were $6,657,400, a sharp 23.3% rise, comprising coffee 38.8% (1939–40: 38.0%), bananas 23.3% (11.7%), sisil hemp 13.0% (12.5%), sugar 7.7% (17.5%), cotton 7.0% (11.3%) and cacao 2.1% (1.8%). Imports came largely from the United States 83.58% (1939–40: 73.3%), Great Britain 8.53% (11.78%) and Japan 2.88% (2.79%). These values represented a continuing increase in imports from the United States (1938–39: 62.96%; 1939–40: 73.3%), a small increase for Japan, and a continued decline for Great Britain. Exports were taken by the United States (87.92%), Great Britain (5.95%) and Japan (3.55%).

Communication.—External communication was by sea and air. About 160 mi. of railroad, 1,500 mi. of highway and the Artibonite river, navigable for about 100 mi., provided internal communication.

(L. W. BE; L. C. DE A.)

Halifax, Edward Frederick Lindley Wood, 3RD VISCOUNT (1881–), British statesman. See *Encyclopædia Britannica* for his biography. On Feb. 25, 1938, he succeeded Anthony Eden (*q.v.*) as foreign minister and retained this post through the "Munich era" and through the various reshufflings of the war cabinets of Chamberlain and Churchill. On Dec. 23, 1940 he was named British ambassador to the United States. Halifax arrived in the United States Jan. 24, 1941, aboard the British battleship "King George V" and was personally greeted in Chesapeake bay by President Roosevelt, who escorted the new ambassador to Washington. He presented his credentials Jan. 30. On March 25 he listed as one British war aim world-wide economic co-operation and political freedom after the axis' defeat.

In June he received honorary degrees from Columbia, Harvard and Yale universities. Later he made an inspection tour of aircraft plants on the U.S. west coast. He flew to London in August and returned to his post at Washington Oct. 1.

Hall, Grover Cleveland (1888–1941), U.S. editor, was born Jan. 11 at Haleburg, Ala., and began his career as a printer's devil. He later became editor of the *Montgomery* (Ala.) *Advertiser* and for many years was an active crusader in the cause of tolerance. His editorials in the *Advertiser* denouncing the Ku Klux Klan, flogging, racial hatred and religious intolerance won the 1928 Pulitzer prize for the best editorial writing of the year. He died Jan. 9 in Montgomery, Ala.

Hammer Throw: *see* TRACK AND FIELD SPORTS.

Hand-ball. The classic hand-ball event is the national A.A.U. four-wall championship held every year. In 1941 the Lake Shore club of Chicago was the host with entries representing every section of the United States. The outstanding event of that tournament was the victory in the singles for the seventh consecutive year of Joseph Platak of the Lake Shore club. In the doubles, Frank Coyle and Edward Linz of the New York Athletic club were the winners for the third time.

National Four-Wall Rankings for 1941

Singles	*Doubles*
1. Joseph Platak, Chicago	1. Frank Coyle and Edward Linz, New York
2. Stanley Hitz, Harrisburg	2. Joe Gordon and J. L. Goldsmith, Long Beach, Cal.
3. Ed. Rawlings, Kansas City	3. M. Lappin and Al Zerbo, Detroit

Continued interest was manifested in the one-wall game which is played almost exclusively in the east. New York city has been the scene of all the national tournaments in this branch of the game and is considered to have the best players in the U.S.A.

National One-Wall Rankings for 1941

Singles	*Doubles*
1. Arthur Wolfe, New York	1. Morton Alexander and Marvin Hecht, New York
2. Schin Karrik, New York	2. Jos. Garber and Arthur Wolfe, New York
3. Morton Alexander, New York	3. Leon Block and Samuel Lipsky, New York

Women's Rankings (One-Wall, New York Metropolitan District)

1. Marie Zanetti 2. Lucy Caruso 3. May Okon

Harbours: *see* RIVERS AND HARBOURS.

Harris, James Rendel (1852–1941), British Biblical scholar, archaeologist and orientalist, was born at Plymouth. He travelled widely in search of manuscripts and in 1917 acquired a fragment of the Book of Deuteronomy. Harris was curator of manuscripts in John Rylands library, Manchester, Eng., from 1918 to 1925. He wrote more than 100 volumes, principally on the Bible, and was an authority on Old Testament history. Among his later works were *The Builders of Stonehenge* (1933); *Who Discovered North America?* (1934); *A Temple in Tennessee, Emendations to the Greek of the New Testament* (1935) and *An Egyptian Cat Goddess in Britain* (1938). Harris died in Birmingham, England, March 1. (See *Encyclopædia Britannica.*)

Harris, Sam H. (1872–1941), U.S. theatrical producer, was born Feb. 3 in New York city. After a variegated career as prize-fight manager, athletic promoter and producer of burlesque shows, Sam Harris formed a theatrical partnership with George M. Cohan. Their first play, *Little Johnnie Jones,* in which Cohan sang one of his most famous songs, "Give My Regards to Broadway," was an immediate hit. Together they produced 50 plays, many of which were nation-wide successes. Among some of the better known Harris productions were *The Nervous Wreck, Rain, The Jazz Singer, Animal Crackers, Dinner at Eight, Stage Door* and three Pulitzer prize winners: *Ice Bound* (1923); *Of Thee I Sing* (1932) and *You Can't Take It With You* (1937). He died in New York city, July 3.

Harrison, Byron Patton (1881–1941), U.S. senator, was born Aug. 29 in Crystal Springs, Miss. He studied at Mississippi State university and at Louisiana State university, where he spent his spare time playing semipro baseball. He began law practice in Leakesville, Miss., in 1902, and entered politics in 1905, when he was elected district attorney. In 1910 he was elected to the house of representatives, and in 1918 he won a seat in the senate from Mississippi, a post he held until his death. A staunch New Dealer, he helped pave the way for the NRA bill, the Social Security act and parts of the AAA bill. A conservative in tax measures, he was credited with blocking the "share-the-wealth" tax bill in 1936 and for shelving the undistributed profits tax measure in 1937. He was president pro tempore of the senate after the death of Sen. Key Pittman in 1940. Though suffering ill health during his last months in congress, Sen. Harrison won his last big battle in pushing the Lend-Lease act through the senate. He died in Washington, D.C., June 22.

Hart, Thomas Charles (1877–), U.S. naval officer, was born June 12 in Davidson, Mich. He was graduated from Annapolis in 1897, was commissioned as ensign in 1899 and advanced to the grade of captain in 1918. He served in the Spanish-American War and was a commander of submarines in World War I. He was made a rear admiral in 1929 and took command of the Asiatic fleet in July 1939. Adm. Hart reached retirement age in June 1941, but was kept on duty because, Secretary of the Navy Knox declared, he was "a good man handling a situation in the far east that requires great skill." When the U.S.-Japanese war broke out in Dec. 1941, he was compelled to take up defensive positions in Philippine waters, since the Asiatic fleet was a comparatively light naval force consisting of four cruisers, an aircraft carrier and a dozen each of destroyers and submarines.

Harty, Sir Herbert Hamilton (1880–1941), Irish composer and conductor, was born Dec. 4 at Hillsborough, County Down, Ireland. He was conductor of the Hallé orchestra in Manchester from 1920 to 1933 and also conducted many other leading English orchestras. He toured the United States as guest conductor, and in 1934, following an extensive tour of Australia, he went to Chicago to conduct special concerts at the Century of Progress exposition. Among his compositions are: "A Pianoforte Concerto in B Minor" and "The Children of Lir" for orchestra. He died at Brighton, England, Feb. 19. (See *Encyclopædia Britannica.*)

Harvard University, oldest institution for higher education in the United States, completed the fifth year of its fourth century in 1941. At the end of the fiscal year, June 30, 1941, investments exclusive of land, buildings and contents used for educational purposes stood at $157,000,000. Gifts during the year were $6,188,659 for capital account and $1,689,953 for immediate use.

Scholarships and other student aids totalled $735,444, exclusive of student loans. The scholastic year 1941–42 began with an enrolment of 7,214 full time students and a faculty and educational administrative staff of 1,930. Student enrolment fell about 10%, due to conscription and enlistments, chiefly in the graduate schools. The university library, largest university library in the world, had 4,265,792 volumes and pamphlets on June 30, 1941.

Harvard's new graduate school of dental medicine opened in the fall of 1941, offering a five-year course in dental education leading to the degrees of M.D. and D.M.D. under a revolutionary new plan. The law school introduced a two-semester system due to the national emergency. The university made special regulations for students leaving for military service or other national defense service during the academic year. At the business school an intensive 12-month course was opened to train men for defense industrial management. Another new course to train graduate students for quartermaster duty was introduced at the business school. New provisions were made by the college for commuting freshmen so that they now had studies in the freshman dormitories and might lunch with their resident classmates.

Hawaii. The territory of Hawaii consists of a group of eight larger islands and numerous islets in the Pacific ocean between latitudes 18°55′ and 22°15′ N. and between 154°50′ and 160°30′ W. longitude. Their total area is 6,438 sq.mi. The islands are of volcanic origin. From southeast to northwest, they are Hawaii, Kahoolawe, Maui, Lanai, Molokai, Oahu, Kauai, Niihau. In addition, stretching northwestward beyond Niihau over 1,100 mi. is an archipelago of rocks, reefs and shoals which includes Midway (*q.v.*) (longitude 177°22′ W.), notable as the first stop beyond Honolulu of the China clipper planes. Likewise, 960 mi. south of Honolulu and a part of the city and county of Honolulu lies Palmyra, a coral atoll consisting of 55 islets, five miles long and two and a half miles wide. The youngest island, geologically, and the largest in the group is Hawaii, with an area of 4,030 sq.mi. (*See* map on page 325.)

The capital of the territory is Honolulu, situated on the island of Oahu. It is a completely modern city with a population (1940 census figures) of 180,986. The population of Hawaii (1940 census figures) is 423,330.

The racial origin of this population, in addition to the native Hawaiians and Caucasians from the mainland, is Japanese, Chinese, Korean, Filipino, Portuguese. However, 82% of the population is native born.

History.—The governor in 1941 was Joseph B. Poindexter; and the delegate, Samuel W. King. The territory collected in taxes and fees $17,064,934.67 in 1941, and expended $16,387,698.43. In addition, federal taxes paid into the United States treasury

EMERGENCY HOSPITAL in Honolulu burning Dec. 7, 1941, after it had been struck by Japanese high-explosive and incendiary bombs

exceed the payment of many states of the union.

The Japanese attack on Pearl Harbor, Honolulu and Hickam field early in the morning of Dec. 7, 1941, was the signal for U.S. entrance into World War II. This treacherous assault, which admittedly took the U.S. navy unawares, caused considerable damage to the Pearl Harbor base and to planes and equipment at Hickam field. One battleship was sunk and another capsized; three destroyers, a minelayer and a target ship were also lost. After this initial blow, however, the Japs did not return to attack Hawaii during the rest of 1941, except for intermittent and harmless shelling of Maui and Johnston Island on Dec. 15–16. (*See* also WORLD WAR II.)

Agriculture.—Hawaii's chief crops are sugar and pineapples. Expert management, scientific methods and costly irrigation works raised the sugar production to a maximum of 1,035,548 tons in 1933 with a value of $66,482,181. The value of the sugar shipments in 1940 was $47,266,417. The pineapple industry, next in importance, produced fresh and canned pineapple and pineapple juice valued at $45,899,359. Other agricultural crops are coffee, macadamia nuts, papayas and taro, a root which is used by the natives in making the native "poi" and which also is processed into flour. (G. J. S.)

Hawley, Willis Chatman (1864–1941), U.S. congressman, was born May 5 near Monroe, Ore., the son of a farmer. He attended rural schools and graduated from Willamette university at Salem, Ore., in 1884. He returned to his alma mater as a mathematics professor in 1891 and two years later he was made president of the school. In 1906 he was elected on the Republican ticket to the house of representatives, holding his seat through successive elections until 1932. A leading advocate of a high protective tariff, he was the co-author, with Sen. Reed Smoot (*q.v.*), of the Smoot-Hawley Tariff act enacted in 1930. The act was held by some to be responsible for the ensuing slump in U.S. foreign trade and was sharply criticized as a measure inimical to farming and trade interests.

Hawley, however, defended the bill as "an alert guard protecting U.S. industries and labour against unfair competition and unfair trade practices . . ."

He was defeated in the Democratic landslide of 1932. Hawley died in Salem, Ore., July 24.

Hay. The United States hay crop in 1941 was 94,107,000 tons from 71,893,000 ac. The all-time record crop of 98,151,000 tons in 1927 was only 4·3% larger than the 1941 crop which, the U.S. department of agriculture reported, was composed of one-third alfalfa, one-fourth clover-timothy, one-sixth legumes and one-fourth wild hay and lesser varieties of tame hay. The 1940 crop was 94,541,000 tons from 71,806,000 ac.; the ten-year (1930–39) average was 78,733,000 tons from 67,893,000 ac., including two historic drought years. The yield in 1941 was 1·31 tons per acre; it was 1·32 tons in 1940 and averaged 1·16 tons per acre for the ten-year period. All tame hay totalled 82,358,000 tons from 59,232,000 ac. in 1941; in 1940, all tame hay, 85,076,000 tons from 60,172,000 ac.; the ten-year average, 69,650,000 tons from 56,102,000 ac.; the tame hay yield, 1·39 tons per acre in 1941, and 1·41 tons in 1940 with a ten-year average of 1·24 tons per acre. The wild hay crop of 1941 was 11,749,000 tons from 12,661,000 ac., compared with 9,465,000 tons from 11,634,000 ac. in 1940 and a ten-year average of 9,083,000 tons from 11,791,000 ac. The wild hay yield in 1941 was 0·93 tons per acre; it was 0·81 tons in 1940 and averaged 0·76 tons per acre for the ten-year period. Clover-timothy production was 23,106,000 tons from 19,176,000 ac. in 1941, compared with 26,682,000 tons from 19,961,000 ac. in 1940 and a ten-year average of 24,587,000 tons from 22,363,000 ac. The clover-timothy yield in 1941 was 1·20 tons per acre; it was 1·34 tons in 1940; and an average of 1·10 tons per acre for the ten-year period. Cowpeas for hay in 1941 totalled 1,614,000 tons from 1,941,000 ac., a decrease from the 1,720,000 tons (2,010,000 ac.) of 1940. The ten-year average of cowpea hay was 1,660,000 tons from 1,961,000 ac. Peanuts for hay in 1941 were 987,000 tons from 1,894,000 ac.; 1,051,000 tons from 1,967,000 ac. in 1940; and a ten-year average of 715,000 tons from 1,528,000 ac. Soybeans for hay were reduced because of a diversion of acreage to soybean oil; 1,710,000 tons from 3,649,000 ac. in 1941, and 2,101,000 tons of hay from 4,916,000 ac. in 1940; the ten-year average, 728,000 tons from 3,304,000 ac. Lespedeza hay produced 5,521,000 tons from 5,413,000 ac. in 1941, compared with 5,025,000 tons from 4,989,000 ac. in 1940 and a ten-year average of 1,709,000 tons from 1,696,000 ac. Sweet-clover hay, 1,277,000 tons in 1941 from 972,000 ac.; 900,000 tons in 1940 from 750,000 ac.; ten-year average, 884,000 tons from 815,000 ac. (*See* ALFALFA; SOYBEANS.)

U.S. Production of All Kinds of Hay in Leading States, 1941 and 1940

State	1941 tons	1940 tons	State	1941 tons	1940 tons
Minnesota	6,942,000	6,112,000	Colorado	2,310,000	1,922,000
Wisconsin	6,907,000	6,977,000	Kansas	2,221,000	1,619,000
Iowa	5,721,000	6,498,000	Tennessee	2,182,000	2,006,000
California	4,846,000	5,067,000	South Dakota	2,090,000	1,731,000
New York	4,230,000	5,733,000	Washington	1,969,000	1,692,000
Nebraska	3,785,000	2,406,000	Oregon	1,917,000	1,876,000
Illinois	3,643,000	4,262,000	Kentucky	1,815,000	1,720,000
Missouri	3,554,000	3,720,000	Oklahoma	1,716,000	1,555,000
Ohio	3,329,000	3,847,000	Arkansas	1,648,000	1,627,000

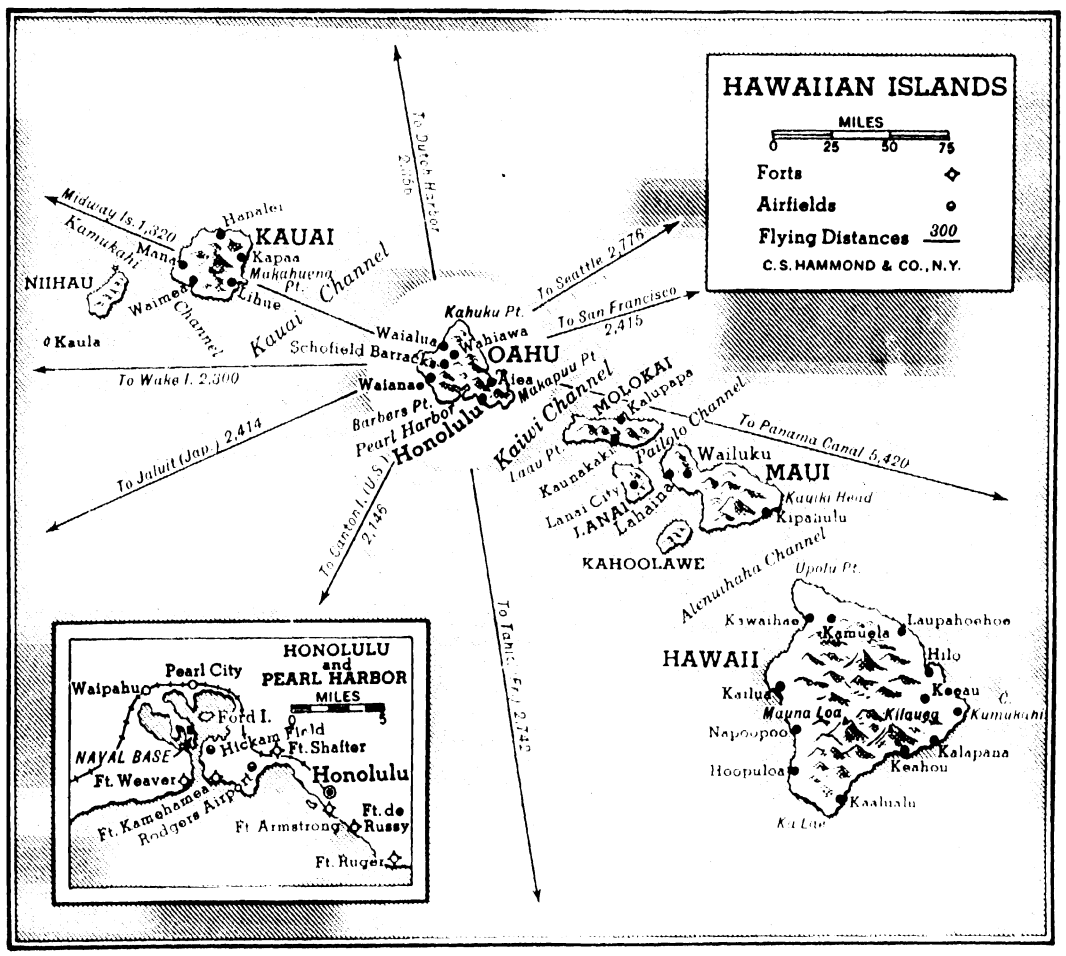
Montana	2,318,000	2,160,000	North Carolina	1,091,000	1,044,000

(S.O.R.)

Hayes, Sir Bertram Fox (1864–1941), British sea captain, was born April 25 at Birkenhead, England. In his youth he signed on a sailing ship and spent nine years aboard windjammers. In 1889 he entered the service of the White Star line. His first command, the "Britannic," carried 37,000 troops to Africa during the Boer War. He was decorated by King Edward VII with the Transport medal. During World War I he commanded the "Olympic" and successfully ferried 300,000 troops, mostly Americans, across the Atlantic without an accident. Twice encountering submarines during these perilous crossings, Sir Bertram sank one by gunfire and the other by ramming. He retired from active service in 1924 and became a director of the White Star line. His autobiography, *Hull Down: Reminiscences of Windjammers, Troops and Travellers,* was published in 1925. He died at his home, Crosby, Liverpool, Eng., on May 15.



MAP OF THE HAWAIIAN ISLANDS, with inset showing Pearl Harbor, Honolulu and Hickam field, principal targets of the Japanese attack of Dec. 7, 1941

Hazen, Charles Downer (1868–1941), U.S. historian, was born March 17 at Barnet, Vt. He graduated from Dartmouth in 1889 and studied at Johns Hopkins and at the universities of Goettingen, Berlin and Paris. He was a professor of history at Smith college, 1894–1914, and at Columbia university, 1916–37. Retiring in 1937 from the Columbia faculty, he became professor

emeritus of European history. Hazen was widely known as an authority on the French Revolution. His publications include: *Contemporary American Opinion of the French Revolution* (1897); *Europe Since 1815* (1910, revised 1923); *Modern European History* (1917); *The French Revolution and Napoleon* (1917); *Alsace-Lorraine under German Rule* (1917); *The Government of Germany* (1917); *Fifty Years of Europe, 1870–1919* (1919); *Modern Europe* (1920); and *The French Revolution* (1932). Hazen died in New York city, Sept. 18.

Hearing Aids: *see* DEAFNESS.

Heart and Heart Diseases. Although physiologists have studied normal men and animals as individuals with their interrelationships of many organs they have not analyzed large enough series of human beings to be able to tell adequately the range of the normal. During the past few years it has steadily become more and more apparent that errors of diagnosis, not of omission but of commission, have been common and increasingly so (with the development of more and more methods of examination), due to labelling as disease findings by symptom, sign, X-ray or electrocardiogram which are in reality variations of the normal but which had been previously unrecognized as such. Hence some have become intensely interested in the range of the normal heart at all ages and in all its relationships and methods of study (White, 1941), and are spending much time reversing diagnoses of heart disease.

One of the methods of study of the heart introduced years ago but disappointing in its accomplishments is the graphic record of heart sounds and murmurs, called phonocardiography. The reason for its unsatisfactory clinical application was due to ignorance about fundamental concepts. Now that co-ordinated studies are in progress by doctors interested in auscultation working with acoustical engineers, important progress has been made (Sprague and Rappaport, 1941).

The reason for the difficulty in the past was the failure to differentiate between records of the coarse vibrations of the chest wall itself (linear phonocardiogram, essentially the old "mechanical cardiogram"), mostly inaudible to the human ear, and the vibrations picked up and transmitted by the stethoscope to the microphone (called the stethoscopic phonocardiogram), some of which are inaudible to the ear, and finally, the vibrations that are actually within the human audiogram range (called the logarithmic phonocardiogram) with a filtering out of the vibrations above and below the human range and amplification of those within the range to accord with what the average trained physician can hear. Thus with the logarithmic phonocardiogram, which accords with the human audiogram, at last a graphic record of auscultatory findings is available.

This does not mean, however, that there is no place for the other two types of phonocardiogram, since it is quite possible, in fact probable, that vibrations that are inaudible still have an importance in the mechanism of the heart both in disease and within the range of normal.

Other developments, in 1941, in the study and treatment of heart disease itself, not spectacular but important, were (a) further confirmation of the special role of haemolytic streptococcus infections (mostly of the upper respiratory tract) in the initiation of rheumatic fever (even in epidemic form) and their control, in part at least, by the prophylactic use of the sulphonamide drugs in children (Coburn; Thomas, France and Reichsman); (b) further study of the specific hypotensive effect of renal extracts in the serious and common, and hitherto incurable, disease called essential hypertension (high blood pressure of unknown cause) which, though still in the experimental stage, gives much promise (Page *et al.*; Harrison *et al.*); and (c) continued development of the two surgical measures that have demonstrated their permanent value as curative therapy, namely, pericardial resection for chronic constrictive pericarditis (Harrison and White), and ligation for patency of the ductus arteriosus (Gross).

Selective Service Rejections.—In the examination of drafted men for the army, it was found that the percentage of rejections for cardiovascular abnormalities among the total rejections varied in different areas of the U.S. from 5% to 13%, averaging fifth among the various causes.

Heckscher, August (1848–1941), U.S. philanthropist and real estate operator, was born Aug. 27 in Hamburg, Germany, the son of a German diplomat and statesman. He emigrated to the United States in 1868 and joined a wealthy branch of his father's family who took him into their coal business. He later went into the zinc business where he made and lost a fortune. In the early 1900s he invested in real estate in New York city and made another fortune. At that time he became interested in philanthropy and built the Heckscher foundation for children. Continuing his welfare work, he built camps and parks for the city's poor and was active in many campaigns to do away with New York slums. He died at his winter home in Mountain Lake, near Lake Wales, Fla., April 26.

Helium. The Cliffside (Texas) gas field in the fiscal year ending June 30, 1940 produced 547,674,000 cu.ft. of helium-bearing natural gas, which went to the plant at Amarillo, operated by the U.S. government for the recovery of the contained helium. The recovered helium totalled 9,450,855 cu.ft., of which 3,531,410 cu.ft. went to the navy department, 2,624,335 cu.ft. to the weather bureau, and 1,514,155 cu.ft. for medical, scientific and commercial use, besides unreported amounts delivered to other agencies of the government. Aside from the original use for the inflation of aircraft, the most important development is in the inflation of observation balloons by the navy, army and weather bureau.

Along medical lines, research continued on the use of helium-oxygen mixtures in caisson disease, in the alleviation of breathing difficulties in respiratory diseases, and in the use of helium to dilute anaesthetics, to prevent fires and explosions. The larger output during the year made it possible to reduce prices of helium to all consuming agencies, and production in the 1942 fiscal year was expected to reach 12,500,000 cu.ft., as compared with the 1941 delivery capacity of 20,000,000 cu.ft. from the gas wells in use, and of 24,000,000 cu.ft. for the recovery plant. Funds were appropriated to raise the well production capacity to that of the recovery plant. (G. A. Ro.)

Henderson, Leon (1895–), U.S. economist, was born in Millville, N.J. on May 26. In 1917 he entered the U.S. army as a private, attaining the rank of captain of ordnance by 1919. In 1920 Henderson returned to Swarthmore

college, where he received his B.A. degree. He was assistant professor of economics at Carnegie Institute of Technology, 1922–23, and was director of consumer credit research for the Russell Sage foundation in New York city, 1925–34. During the New Deal era, he served as consulting economist to the Work Projects administration.

On April 11, 1941 the Office of Price Administration and Civilian Supply (later renamed the Office of Price Administration, *q.v.*) was created by President Roosevelt to check the rise in prices caused by the defense program, and Henderson was placed at the head as price administrator. In July 1941 Henderson, who had been a Securities and Exchange commissioner since 1939, resigned this post to devote himself to his new task. Long a foe of monopoly, he frequently assailed the "business as usual" attitude of big industry, declaring it was not consistent with the nation's defense program. He put strong price curbs on metals and other basic materials needed by the armed forces but urged even more rigid controls to check the inflationary trend.

On Dec. 26, 1941, after the U.S. entered World War II, he strictly rationed motor-car tires and on Jan. 2, 1942, he announced that all motor-car production for civilian use would be halted "for the duration."

Hershey, Lewis B. (1893–), director of U.S. selective service system (*q.v.*), was born on a farm near Angola, Ind.; attended, taught public schools and was graduated from Tri-State college at Angola. Entering the Indiana national guard in 1911, he went to the Mexican border with his unit in 1916, and to France with the 137th field artillery in 1918 as a captain. On his return to the United States after the war, he passed the examination for a commission in the regular army. He was stationed at Fort Sill, and later at Ohio State university where he was assistant professor of military science and tactics for four years. He was at the command and general staff school at Ft. Leavenworth, Kan. for two years, and then at the Army War college in Washington.

Subsequently he was sent to Hawaii for two years and upon his return to the United States in 1937 was appointed to the joint army and navy selective service committee as executive secretary. He was largely responsible for laying the foundation of the selective service system as authorized by the National Defense act of 1920, and for setting up the operating machinery for its organization when it was authorized by the Selective Training and Service act of 1940.

In recognition of this work he was raised to the rank of brigadier general in Nov. 1940 and was appointed director of selective service by the president on July 31, 1941 and confirmed by the senate on the same day. (E. M. Cn.)

Hess, Rudolf Walther (1894–), German politician, christened Richard Rudolf, was born April 26 at Alexandria, Egypt, the son of a German importer. He studied in Switzerland and Godesberg, Germany. During World War I, he enlisted in the German army, saw heavy fighting at Verdun, and met Adolf Hitler on a French battlefield. After the war Hess became Hitler's personal aide in the fledgling nazi party. They fought side by side in the abortive Munich beer hall putsch of 1923 and were imprisoned together.

In 1925 Hess became Hitler's personal secretary and served his fuehrer with unswerving loyalty during the critical years of the nazi party's rise to power. Hess reorganized and "cleansed" the nazi party so well that the fuehrer made him his personal representative in all party matters, as well as a member of the secret cabinet. On May 10, 1941 Hess flew to Scotland, made a parachute landing near Glasgow and was held incommunicado by the British

"LOOK WHO SAYS HESS IS CRAZY." Comment of Thomas in the *Detroit News* on the flight of Hitler's deputy to Scotland May 10, 1941

authorities. Nazis tried to explain his flight on grounds that he was suffering from "hallucinations and a mental disease."

Rumour had it that Hess flew to Scotland in the role of a peacemaker, but the British government failed to offer an official explanation in 1941.

Higginson, Mary Potter Thacher (1844–1941), U.S. poet and author, was born Nov 26 in Machias, Me. Her first book, *Sea Shore and Prairie*, was published in 1876. After the death of her husband in 1911, she wrote his biography, *Thomas Wentworth Higginson, The Story of His Life*. In 1929 she published *Fugitives*, a collection of poems. She died Jan. 9 at her home in Cambridge, Mass.

Highways: *see* Roads and Highways.
Highway to Alaska: *see* Roads and Highways.

Hilferding, Rudolf (1877–1941), German statesman, was born Aug. 10 in Vienna, Austria. Hilferding, who was finance minister in two German Social Democratic governments, fled to France when Hitler came to power in 1933. He was arrested during the German invasion of France in 1940, but later was released. He was kept under constant police surveillance, however, and he was again imprisoned by the nazis in Feb. 1941. A dispatch from Berlin dated Sept. 17 said that Dr. Hilferding had been found hanged in his prison cell "somewhere in occupied France." (See *Encyclopædia Britannica.*)

Hill, Sir Arthur William (1875–1941), British botanist, was born Oct. 11. He attended King's college, Cambridge, and was a lecturer in botany at Cambridge, 1905–07. Sir Arthur was assistant director of the Royal Botanic gardens at Kew, 1907–22, and director from 1922 until his death. He travelled widely in pursuit of his interests in botany and wrote many scientific papers. He was a fellow of the Royal and Linnaean societies and an honorary member of the New York Academy of Arts and Sciences. He was knighted in 1931 and received the Veitch gold medal of the Royal Horticultural

society, 1937. He was killed in an accident while horseback riding in London, Nov. 3.

Hill, Robert Thomas (1858–1941), U.S. geologist, was born Aug. 11 in Nashville, Tenn. Orphaned at five, young Hill left school at 15 to work as typesetter for his brother, a newspaper publisher in a small Texan town. His accidental discovery of a fossil shell aroused his interest in geology and he went to Cornell university to study the subject. After graduating in 1886, he was offered a post with the U.S. geological survey, remaining with this branch of the service until 1930. He also served as palaeontologist for the Smithsonian institution, 1885, and as geologist of the Arkansas geological survey, 1888–90.

He explored, together with Prof. Alexander Agassiz of Harvard, strata of the American-Caribbean region. Dr. Hill died in Dallas, Tex., July 28.

Hillman, Sidney (1887–), U.S. labour leader, was born at Zagare, Russia, on March 23, the son of a merchant. In his youth he studied to become a rabbi, but left school to work in a chemical laboratory in Kaunas. In 1907 he migrated to the United States, where he worked first as a clerk, then as a garment cutter. In Chicago he interested himself in labour unions, led a successful strike in a clothing house and by 1915 was president of the Amalgamated Clothing Workers of America. He went to Washington in the early days of the New Deal and became a member of the labour advisory board of the NRA. He served on the National Industrial Recovery board in 1935, and the next year, as treasurer of Labor's Non-Partisan league, campaigned vigorously for the re-election of President Roosevelt. Later he was a member of the textile and clothing industry committees for the Fair Labor Standards board and was elected vice-president of the Congress of Industrial Organizations. Upon the organization of the advisory commission to the council of national defense May 28, 1940, Hillman was named commissioner of employment. With William S. Knudsen (*q.v.*) he became a prominent figure in U.S. defense activity Jan. 7, 1941, when President Roosevelt appointed him associate director general of the Office of Production Management (*q.v.*). In this office, throughout 1941, Hillman had much to do with the prevention and settlement of defense strikes. He also formulated plans for labour replacement in industries such as silk which were disrupted by the defense program. On Aug. 28 he was named to represent labour on the Supply Priorities and Allocations board (*q.v.*). The split between Hillman and John L. Lewis was not healed during 1941, and pro-Lewis forces drafted resolutions for the C.I.O. convention which sought Hillman's removal from his position with OPM.

Hintze, Paul von (1864–1941), German admiral, diplomat and onetime aide-de-camp to Kaiser Wilhelm II, was born Feb. 13 at Schwedt-on-the-Oder, Germany. The kaiser frequently explained to friends visiting him at Doorn that Admiral von Hintze, who was foreign minister in 1918, urged his abdication on grounds that Germany could obtain better peace terms from the Allies. After the armistice, the admiral quit the diplomatic arena to live in retirement. He died in Berlin, Aug. 23. (See *Encyclopædia Britannica.*)

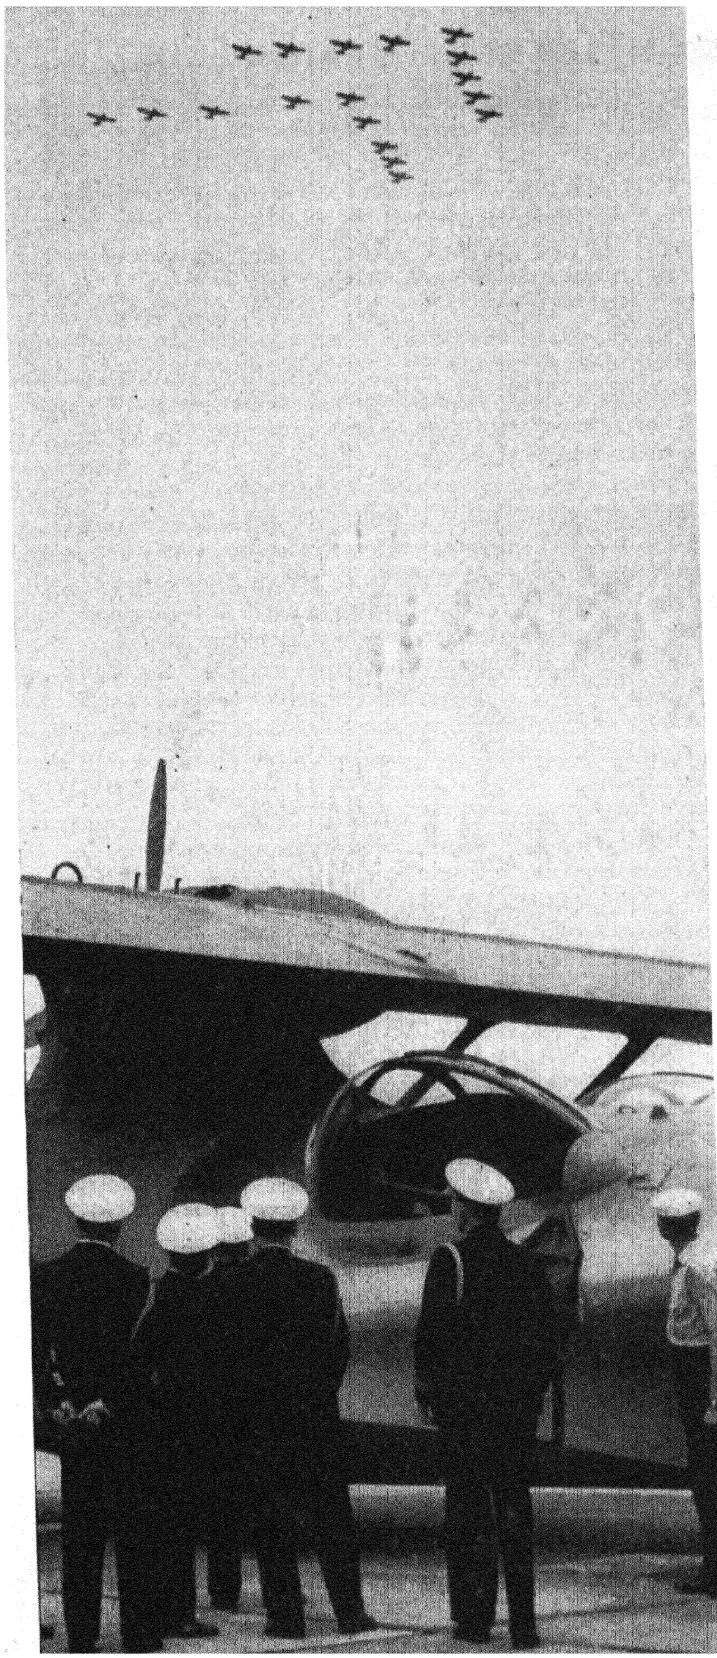
Hispanic America: *see* ARGENTINA; BOLIVIA; BRAZIL; BRITISH GUIANA; BRITISH HONDURAS; CHILE; COLOMBIA; COSTA RICA; ECUADOR; FRENCH COLONIAL EMPIRE; GUATEMALA; HONDURAS; NICARAGUA; PANAMA; PARAGUAY; PERU; SALVADOR, EL; SURINAM; URUGUAY; VENEZUELA.

Hispanic America and World War II. During 1941 World War II (*q.v.*) continued to affect Hispanic America with increasing intensity. The stunned paralysis which characterized Hispanic America through the first year and a half of the war gave way in 1941 to a positive policy of action in the face of an ever-growing peril. The year was marked, therefore, by a crystallizing of opinion as the Hispanic nations of the new world, in company with the United States, took long steps on the road toward continental solidarity. Although the goal was still unachieved as the year closed, very definite progress had been made on the economic, political and defense fronts. These three aspects, while distinct, were nevertheless closely interrelated.

Economically, the disruption of earlier periods of the war continued, but was materially abated as readjustment was made and as war demands for strategic materials tended generally to stimulate economic activity. The most serious continued lacks were of fuel for industrial needs (all the more acute, because of increased domestic industrial production) and of shipping space. Action of Chile, Argentina, Brazil and others to acquire axis ships tied up in their harbours was at best palliative. Generally, the United States continued to supply an increasingly greater proportion of imports, as warring nations sharply reduced their own exports, and to take a considerably larger volume of Hispanic-American exports, with Great Britain remaining the only important European purchaser. Hispanic-American exports to the United States in the second year of war totalled $838,322,000, imports from that country $785,723,000, increases of 78·7% and 60·3% respectively over the year ending Aug. 31, 1939. Accelerated trade with the United States was especially noteworthy in Argentina. Full expansion of United States trade was hampered, however, by priorities imposed within that country. Japanese trade was likewise of considerable significance as Japan piled up reserves of key commodities, notably cotton and metals. Japanese buying was curtailed, however, when the United States (and some of the Hispanic-American states as well) froze Japanese credits. To obtain strategic materials for its own needs, as well as to keep them out of axis hands, the United States contracted with Mexico, Peru, Brazil and other countries—in return for an absolute ban on export of certain materials beyond the hemisphere—to buy any surpluses which might remain. In all this, the Hispanic-American republics benefited economically. To finance carried-over surpluses, and purchases from the United States for which no exchange was available, and to stabilize currencies reeling from the impact of war, the United States Export-Import bank extended credits to almost every republic. Other credits went for highway construction and other public works of potential advantage to hemisphere defense. Under war conditions, too, trade among Hispanic-American countries was notably expanded.

Direct economic effect, too, of World War II was felt in the trend toward economic diversification and stress upon noncompetitive commodities for export to the United States, thus replacing lost European markets. Rubber and rubber substitutes (as guayule in arid northwestern Mexico) were notable illustrations. Although achievement was still in the blueprint, or, at best, the seedling stage, definite progress was nevertheless made in several countries—Costa Rica, Mexico, Brazil, the Dominican Republic. Brazil emphasized the previously unexploited babassu palm nut as a source of vegetable oil and a possible automotive fuel, and pressed exploitation of the oiticica palm as a tung oil substitute. For the second year Paraguay exported tung oil in quantity. Cuba expanded manganese production, and in Argentina, mining assumed appreciable stature for the first time, with a three-year United States contract for the entire tungsten output.

Stirred by the spread of war, Hispanic America took steps



THE CHIEF-RANKING NAVAL OFFICERS of ten Latin American countries inspected the Norfolk naval air station during their goodwill tour of U.S. shipyards in May 1941

toward improvement of its defenses—usually under the leadership of the United States, or at least with its aid. These measures took the form of increased military establishments, improved training, development of bases for hemisphere defense, and finally of co-operation in general defense, although policies and procedure varied from country to country. Without exception every republic at least enacted legislation to increase its defense personnel and equipment.

United States military and naval missions continued to train ersonnel, in some cases replacing Italian and other missions, hile many officers went to the United States for special training r for observation of methods and tactics. This collaboration was specially noteworthy in Mexico. Argentina, on the other hand, s a rule held aloof. It protested a proposed Uruguayan grant) the United States of facilities for an air-naval base which ould serve to defend the South Atlantic. Air bases in Brazil, hose vulnerability was rendered acute by closeness to nazi-dom- ated Dakar (*q.v.*) in West Africa (1,600 mi.), were granted by ie Brazilian government under the cloak of concessions to the an American Airways. Other than airport facilities granted by anama in March, no actual direct grants of bases to the United tates were made during 1941, however. Rumours of such grants y Chile and Ecuador did not materialize, in the opinion of some bservers because of possible adverse effect upon public opinion.)irect aid for defense, on a "lend-lease" basis, however, was iven several countries by the United States. Brazil's genuine oncern over the threat from overseas was well illustrated by her ollaboration with the United States in its measures to protect urinam (*q.v.*).

All the Hispanic American republics felt the effect of pro-axis ropaganda during the year. An axis-inspired revolt in Bolivia as thwarted in May, as were well laid plans in Argentina, involv- ig also Chile, Brazil and Uruguay, in September by the Damonte aborda investigation. In several instances, flagrant violations f diplomatic immunity were met by sharp action from the coun- y affected. Thus, in September, El Salvador severed relations ith Italy, while Panama, resenting derogatory remarks of the pro- xis Spanish ambassador, expelled him in November. Formal and ll but unanimous demand for expulsion of the German ambassa- or was made by the Argentine chamber of deputies. Public opin- n throughout Hispanic America was, by and large, overwhelm- igly anti-axis, although entry of the U.S.S.R. into the war mpered the support of strong Roman Catholic elements, espec- ally in Ecuador. Government policies, however, were conditioned y internal political considerations, notably in Argentina and hile, and by the boundary conflict between Ecuador and Peru. he situation was further complicated by the presence in Brazil, rgentina, and above all in Chile, of important Germanic popula- on elements which were either inclined toward nazi dogma or ere under special pressure from axis agents, by fears—skilfully layed upon by those agents—that axis victory would bring retri- ution, and by traditional dislike or distrust of the United States nd jealousy of any interference or implied leadership from the utside. The last was temporarily heightened by publication of a nited States blacklist of axis nationals and firms doing business n various Hispanic American countries and nationals associated ith them.

In general, the Argentine government, under Acting President astillo, tended to be anti-United States, although not pro-axis. araguay, dominated by rampant militarism; Chile, strongly na- onalistic and inclined toward international isolationism, and Panama under President Arias, were, along with Argentina, the least co-operative in hemisphere defense. On the other hand, Uruguay, long South America's leading champion of Pan Americanism, and Colombia, the continent's best example of democracy in practice, were, with Venezuela, actively friendly toward the United States. So, too, were the Central American and Caribbean states, and, strikingly, Mexico, whose government expressed the country's anti-axis feelings by resuming diplomatic relations with Great Britain (severed in 1938), and in numerous acts of co-operation with the United States. Brazil and Peru, traditionally pro-United States and pro-British, and unstable Bolivia and Ecuador were likewise generally friendly toward the United States and its

policies.

Japan's attack upon the United States, on Dec. 7, came as a shock to all Hispanic America. With striking unanimity and speed the Central American and West Indian republics forthwith declared war on the principal axis powers, in some instances preceding similar United States action. Mexico, Colombia and Venezuela severed relations entirely, others in part. Without exception, each of the nonwarring republics asserted the principle first enunciated by Uruguay upon United States entry into World War I in 1917, that any American nation at war with a non-American nation would be treated as a nonbelligerent, and therefore be accorded full use of ports and other facilities. This attitude was in striking contrast to that of 1917, when Mexico was openly pro-German and, in South America, only Brazil declared war, while five republics remained neutral. All the republics vigorously accelerated their defense preparations. Argentina and Chile undertook to modify their 1881 treaty demilitarizing the Strait of Magellan. Mexico, with consummate tact, requested United States permission to send Mexican troops through the United States to garrison her isolated territory of Lower California, then tendered full use of her own facilities to the United States whenever they might be needed.

Upon the initiative of Chile, in accord with machinery set up at the outbreak of World War II in Sept. 1939, a conference of foreign ministers of the American republics was called to meet at Rio de Janeiro Jan. 15, 1942. (*See* PAN AMERICAN UNION; WORLD WAR II and articles on individual countries.)

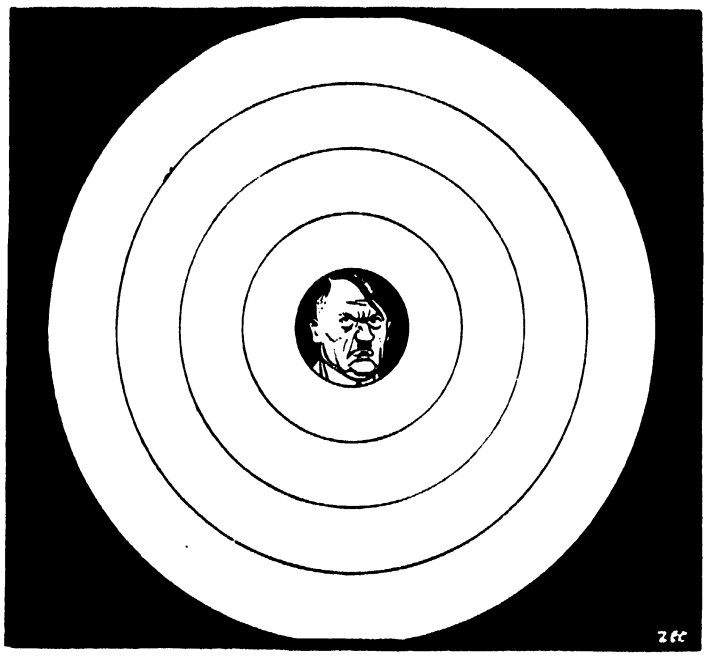
Hitler, Adolf (1889–), German statesman, was born at Braunau on the Inn in Austria on April 20. For his early career, see *Encyclopædia Britannica*. In the so-called Munich Beer Hall Putsch of Nov. 9, 1923, Hitler attempted with Ludendorff, Goering (*q.v.*), Frick, Streicher, Roehm and others to seize the Bavarian government, but was arrested, tried for treason, and condemned to imprisonment at Landsberg. Here he dictated to his secretary, Rudolf Hess (*q.v.*), his famous book, *My Struggle* (*Mein Kampf*).



THE "WAR AIM" suggested by Cartoonist Zec of the *London Daily Mirror* in 1941 was eloquently simple

It is in part an autobiography and in part an exposition of his ideas for the regeneration of Germany, and is hence sometimes called the "Nazi Bible." On his release from prison in Dec. 1924, as a result of a general amnesty, he devoted himself to building up various organizations to strengthen the nazi party: Brown Shirts, Elite Guard (*Schutz-Staffeln* or "SS"), Hitler Youth (*Hitler Jugend*) and other formations. With the aid of these, with efficient lieutenants, and with his magnetic oratory, his nazi party grew rapidly in power, winning 12 reichstag seats in 1928 and 230 in July 1932. On Jan. 30, 1933, Hitler was appointed Reich chancellor and began the social and political revolution establishing the "Third Reich." Upon Hindenburg's death Aug. 1, 1934, Hitler succeeded him as president but became known as Reich Leader (*Fuehrer*) and chancellor. He became absolute master of the Reich and succeeded in rebuilding Germany's military might within five years. In 1938 he annexed Austria and, by the pact of Munich, dismembered Czechoslovakia. His last "white conquest" was the absorption of Czechoslovakia and Memel in March 1939; war resulted from his demands on Poland. For events in his career in 1941, *see* GERMANY. (S. B. F.)

Hobart, Esther Jane Tuttle (1849–1941), the wife of Garret A. Hobart, 24th vice-president of the United States, was born April 30, in Paterson, N.J. She assumed the duties of "first lady" in the administration of President William McKinley during Mrs. McKinley's illness. Mrs. Hobart died Jan. 8 at Haledon, N.J.

Hobson, Robert Lockhart (1872–1941), British authority on Chinese pottery and porcelain, was born July 26. The son of a clergyman, he was educated at St. John's Leatherhead, and Jesus college, Cambridge. In 1897 he became an assistant at the British museum, and deputy keeper of the department of British and mediaeval antiquities in 1921. He also had served as keeper of the department of oriental antiquities and of ethnography until his retirement in 1938. Among his publications are *Catalogue of English Pottery* (1903); *Guide to English Pottery and Porcelain* (1904); *Catalogue of English Porcelain in the British Museum* (1905); *Worcester Porcelain* (1910); *Chinese Pottery and Porcelain* (1915); *The Wares of the Ming Dynasty* (1923); *The Later Ceramic Wares of China* (1925); and *Catalogue of the Eumorfopoulos Collection* (1925–28). He died at his home in Horsham, Sussex, June 6.

Hockey: *see* ICE HOCKEY.

Hogs. Curtailment of United States supplies of fats and oils from Pacific areas in Dec. 1941, following the outbreak of war with Japan, led to an augmented program for increased production of swine in the United States in 1942. This program called for slaughter of 83,000,000 hogs, a record number, as compared with a total slaughter of 72,500,000 head in 1941. Of the total slaughter for 1942, it was expected that that of federal-inspected packing plants would be 54,000,000 head, compared with 46,519,757 head in 1941 and 50,397,860 in 1940. The fall pig crop in 1941 in the United States was 35,600,000, which was also a new record, 18% more than the 1940 fall crop. The spring, 1942, pig crop, the department of agriculture estimated, would set still another record, 62,000,000 head, 28% more than the 1941 spring crop. The previous largest spring pig crop was 54,500,000, in 1927. Pork products constitute a large part of the food supply sent to Great Britain by the United States and Canada.

Canada restricted its own consumption and banned exports of pork and lard to the United States in 1941 in order to maintain its shipments to Britain.

(*See* BACON; MEAT; *see* also FARM INCOME for United States lend-lease shipments to Great Britain.)

Reports from Denmark, the principal competitor of the United States in the British market for pork products previous to World War II, indicated a sharp decline in the number of hogs in that country after overseas imports of feeds had been cut off. On Oct. 4, 1941, hogs numbered 2,013,000 in Denmark, or 37% less than at the beginning of the war, the office of foreign agricultural relations, U.S. department of agriculture, reported.

From the same source on Dec. 15, 1941, came reports from Hungary that apparently indicated severe curtailment of pork and lard in Europe. Feed was so scarce that the number of hogs in Hungary fat enough to be slaughtered as required by government permit was 30% under the number in 1938. Slaughter of lean hogs (under 220 lb.) was not permitted, and, although there was a shortage of pork and lard, farmers were burdened with hogs they could neither fatten nor sell.

The entire hog industry of Europe in 1941 was under military control, and rationing of pork and pork products to the civilian population was general. While it was impossible in 1941 to obtain specific figures, it was known that the scarcity of feed compelled the liquidation of hogs in 1940 and early in 1941. It was believed that the number had been reduced in most countries to a point where they could be maintained on the reduced feed supplies.

In axis-dominated countries, requisitions of pork products were made for the army of occupation and sometimes for export to Germany.

Argentina contracted to supply Great Britain with 88,000,000 lb. of frozen boneless pork during the year ending Sept. 30, 1942, the largest export demand Argentina had ever experienced. Coupled with an extremely low price for corn, this export demand caused a large increase in swine production in Argentina.

(S. O. R.)

HOLC: *see* HOME OWNERS' LOAN CORPORATION.

Holland, Charles Thurstan (? –1941), British scientist and radiologist, was one of the first scientists to experiment with the X-ray after its discovery was made known by Roentgen and was quick to recognize its importance in medical diagnosis and surgical treatment. During World War I he was a member of the war office committee on radiology. He was credited with perfecting a method used during the war for locating bullets embedded in wounded men. He was lecturer at Liverpool university from 1920 until his retirement in 1931. Dr. Holland also was a fellow of the Royal College of Surgeons, twice president of the Roentgen society, fellow of the Royal Photographic society and fellow of the American College of Radiology. He died Jan. 16 in London.

Holland: *see* NETHERLANDS.

Holt, Sir Herbert Samuel (1856–1941), Canadian financier. Once a day labourer, he became one of the richest men in Canada. At one time he and his associates controlled a vast network of 250 companies whose total assets were more than $2,500,000,000. Born Feb. 12 in County Kildare, Ireland, he emigrated to Canada in his youth and worked as a railroad labourer. An able executive, he soon became superintendent of construction. He then went into business for himself and became a contractor and railroad builder. By 1901 he had won control of a rich Montreal utility and in 1908 he became president of the Royal Bank of Canada. Another of his successful enterprises was the Canada Power and Paper company, which became a $100,000,000 corporation. Sir Herbert, who was knighted by King George V in 1915, died in Montreal, Sept. 28.

Home Building, Federal: *see* FEDERAL HOME LOAN BANK SYSTEM; HOUSING.

Home Owners' Loan Corporation. HOLC was created by congress in 1933 to make loans directly to distressed urban home owners over a three-year period by taking over their delinquent mortgages. Since its lending operations ceased in 1936, the corporation has been engaged exclusively in the collection of the funds it loaned and in the sale and rental of the properties it has been forced to acquire.

Loans were made at an interest rate of 5%, later reduced to 4½%, and were to run for a period not over 15 years, and to be retired through monthly payments covering principal and interest. The act was amended to permit the corporation to extend its loans to a maximum of 25 years, where the borrower's circumstances and the condition of the security justify such extension.

Provided with $200,000,000 initial capital, HOLC was authorized to issue U.S. guaranteed bonds in an amount not to exceed $4,750,000,000, of which $3,489,453,550 were issued. A total of $2,419,608,800 in bonds was outstanding as of June 30, 1941. The corporation lent more than $3,093,000,000 to about 1,018,000 home owners located in almost all the counties in the United States. Its average loan was slightly more than $3,000.

As of June 30, 1941, only 6·5% of HOLC's 842,288 active accounts were in default. That is, 93·5% of the corporation's total active loans and sales contracts were being repaid in satisfactory fashion. While the remaining borrowers or purchasers were in varying delinquency, only a small percentage were in imminent danger of foreclosure. More than 108,000 loans amounting to $260,000,000 were paid off in full and the mortgages cancelled. From the beginning of its operations through June 30, 1941, HOLC acquired about 182,000 properties. This is 17·9% of the total number of loans granted. On that date the corporation had sold more than 139,000 of its acquired properties. Of the unsold properties available for rental income, about 91% were rented.

The progress of HOLC toward liquidation of its loans and properties is shown by the fact that principal payments on its mortgages and sales contracts on June 30, 1941, reached 33·5% of its original loans plus later advances and refunded interest on extended accounts. (*See* also FEDERAL HOUSING ADMINISTRATION.)

(J. H. FA.)

Honduras. A Central American republic lying mainly on the Caribbean slope. Area, 46,332 sq.mi.; pop. 1,038,061 (1940 official est.); capital, Tegucigalpa (35,000, including adjacent areas); language: Spanish; religion, Roman Catholic; president: General Dr. Tiburcio Carías Andino.

History.—Politically, Honduras was quiet throughout 1941 despite rumours of revolutionary plotting which circulated from time to time. Economically, the country continued in a depressed condition. Pres. Carías' government maintained a close co-operation with the United States. In line with this policy, the government, by decree of June 10, put under strict control a variety of strategic materials to non-American countries. Earlier, the German chargé d'affaires was expelled for propaganda and other activities, and by September all relations with Germany and Italy had been severed. On Dec. 8, congress unanimously voted to declare war on Japan, following this action with declara-

tions against Germany and Italy (Dec. 12).

Education.—There were approximately 1,000 elementary schools in 1941, with an enrolment of 35,000, 93 secondary and two normal schools (3,000 enrolment), and one university. Illiteracy is high. Approximately 10% of all government expenditure was for education in 1941.

Defense.—A standing army of 3,000 was supplemented by extensive reserves in 1941. The small air force (18 planes) is used especially in maintenance of internal order. Honduras had two coastguard cutters in 1941.

Finance.—The monetary unit, the lempira, is valued at 49 cents U.S. The 1941–42 budget presumed balance at 11,446,000 lempiras. The national debt as of June 30, 1940, was $8,715,371 (internal: $6,153,434).

Trade and Resources.—Imports ir the fiscal year 1939–40 were valued at $10,085,069, the United States supplying 62.7% (1938–39: 65.3%), Japan 13.2% (6.0%), Germany 6.5% (11.4%), Salvador 5.5% (4.9%), Curaçao 4.1% (3.9%), Great Britain 2.9% (3%). Exports valued at $9,657,294 were taken almost entirely by the United States (95.6%; 1938–39: 90.7%) and Salvador (2.7%). Bananas (12,677,737 stems) made up 65.5% of all exports valued, silver (4,090,223 oz.) 15%; gold (23,584 oz.) 8.9%. In 1940–41, imports were $10,085,070, exports $9,867,156. In addition to bananas, coffee (2% of exports), livestock, tobacco, coconuts and grapefruit are produced for export. During 1941 a U.S.-Honduran commission of agricultural specialists studied possibilities of developing vegetable fibres and medicinal plants.

Communication.—External communication is by steamship and by Pan American Airways, internal communication by airlines connecting the principal cities. In 1941 there were more than 500 mi. of main highway, and about 800 mi. of railway (besides 700 mi. on banana plantations).

(L. W. Be.)

Honduras, British: *see* BRITISH HONDURAS.

Honey: *see* BEE-KEEPING.

Hongkong. A British crown colony, Hongkong is an island off the southeast coast of China, opposite Kwangtung province, at the mouth of the Canton river. The area of the island, which is rocky and very irregular in shape, is a little over 32 sq.mi.; the area of the so-called New Territory on the mainland, which was administered as part of the crown colony, is 356 sq.mi., with Kowloon, immediately opposite Hongkong island, as the chief town. The non-Chinese civil population of Hongkong (1939) was 23,611; the Chinese population was 1,026,645. There were also some 750,000 Chinese refugees.

Hongkong was a great transshipment centre and in some years ranked as the fourth largest port in the world, as regards the number of ships which entered and cleared. Imports from the British empire in 1939 were £2,588,902, and exports were £5,192,066. Imports from other countries were £31,489,901, and exports were £26,211,193. The unit of currency was the Hongkong dollar, the value of which was about 25 cents. Revenue in 1939 was $41,478,052, expenditure was $37,949,116.

Japanese military operations against Hongkong began Dec. 8, immediately after the declarations of war against the United States and Great Britain. The outer lines on the mainland were forced within a few days, and the Japanese effected landings on the island. British, Canadian and Indian troops carried on a desperate last-stand defense on the rocky hills of the island; but the overwhelmingly superior forces of the invaders, air bombardment and a threatened failure of the water supply forced a capitulation on Dec. 25. General Renzo Isogai was appointed Japanese military governor of Hongkong. Details of the fighting were obscure, because of defective communication. Hongkong had long been regarded as an exposed outpost and had been more and more surrounded as the Japanese established themselves in Canton (in 1938), on Hainan island (1939) and in French Indo-China (1940). It had been counted on only for a delaying action; it probably fell more quickly because the sinking of the two British capital ships in far eastern waters, the "Prince of Wales" and the "Repulse," confirmed Japanese mastery of the sea, and the Japanese also possessed definite air superiority. U.S. pilots took out of Hongkong a number of individuals, including Mme. Sun Yat-sen, who were especially anxious to avoid capture by the Japanese; but a considerable number of British and some U.S. civilians were made prisoners, along with the surviving forces of the garrison. (*See* also JAPAN: *History.*) (W. H. Ch.)

Hopkins, Harry L. (1890–), U.S. politician, was born Aug. 17 in Sioux City, Ia. After graduating from Grinnell college in 1912, he went to New York city to engage in social service work. He later became a fast friend of Franklin Delano Roosevelt, then governor of New York, who in 1931 appointed him director of the New York State Temporary Emergency administration. In 1933, Roosevelt named him federal administrator of emergency relief, and from 1935 to 1938 he was administrator of the Works Progress administration. In the latter position, he expended billions to provide work relief instead of monetary relief for unemployed millions. Hopkins was appointed secretary of commerce, 1938, but resigned in Aug. 1940 because of ill health. In Jan. 1941, he was sent to London as President Roosevelt's personal emissary to study the war situation at first-hand and to act as the president's "eyes and ears" in Britain. On March 27, 1941, the president named him lend-lease co-ordinator. Enjoying a unique position as one of the president's most trusted friends and advisers, Hopkins flew to London on a second mission in July 1941, thence going to Moscow to confer with soviet Premier Josef Stalin. The next month he retired as lend-lease administrator and was succeeded by Edward R. Stettinius, Jr. (*q.v.*).

Hops. United States production of hops (in three states only, Washington, Oregon and California) was estimated by the department of agriculture as 40,380,000 lb. from the 34,800 ac. harvested in 1941. The 1940 crop was 42,066,000 lb. from 32,800 ac. The ten-year (1930–39) average was 34,784,000 lb. from 29,660 ac. The yield was 1,160 lb. per acre in 1941, compared with 1,282 lb. in 1940 and a ten-year average yield of 1,171 lb. per acre. About 400 ac. in Oregon were not harvested because of wind and rain damage. The quality of the crop was good, but the "dry-away" was reported greater than usual. Of the 1940 crop, 5,068,000 lb. were not marketed in accordance with marketing agreement allotments.

U. S. Production of Hops by States, 1941 and 1940

State	1941 lb.	1940 lb.
Oregon	10,800,000	20,286,000
Washington	13,320,000	11,700,000
California	10,260,000	10,080,000

The yield by states in 1941 was 1,850 lb. per acre in Washington, 1,350 lb. per acre in California and 840 lb. per acre in Oregon.

(S. O. R.)

Horgan, Stephen Henry (1854–1941), U.S. inventor of the half-tone engraving process used in the production of newspaper and magazine pictures, was born Feb. 2 near Norfolk, Va. He studied photography in Nyack, N.Y., and in 1874 went to New York city, where he joined the *New York Daily Graphic* as a photographer. While on the *Graphic* he developed the first half tone used in a newspaper, a reproduction of a picture entitled "Shantytown," which appeared in the March 4, 1880 issue. In 1893 he became art director of the *New York Herald.* Balked there in his efforts to apply the half-tone technique to the high-speed presses, he went to the *New York Tribune,* where in 1897 he made the first half tone printed on a web-perfecting newspaper press using stereotypes. On his suggestion the American Telephone and Telegraph company in 1924 sent the first coloured picture over wires. His publications include *Horgan's Half-Tone and Photomechanical Processes* (1913) and *Photoengraving Primer* (1920), which appeared in a 2nd edition as *Photoengraving in Black and Color* (1938). Horgan died in Orange, N.J., Aug. 30.

Horse Racing. In extent and volume, in almost every attendant feature, all previous figures in the United States were surpassed in 1941. When, in 1940, the total amount of money distributed at recognized meetings fell just short of $16,000,000 ($15,911,167), it marked a gain of over $500,000 from 1939. But 1941 saw the total rise to almost $18,000,000 ($17,987,935). To appreciate the meaning of such figures it needs but to be recalled that at the height of the "boom days," just previous to the economic debacle of 1929, the premier year had been 1927, with a total of $13,935,610. The total number of races run rose from 16,401 to 16,912, a gain of more than 500. The number of distinct and separate days of racing given at the various meetings rose from 2,096 to 2,162. While precise figures for the U.S. are unobtainable, those for the New York season may be cited as an indication. During 175 days of racing given in that state there was a total attendance of 2,503,864, a gain of almost 500,000 from 1940, when the figures were 2,041,374. The daily increase was therefore nearly 3,000. The revenue from taxation in 1941 to the state rose from $5,572,990 to $7,168,408. More than $500,000 more was distributed in stake and purse money than in the previous year, the total reaching $2,198,554. In Illinois there was a general increase, in all departments, of about 20%. In California—next to New York, the most important racing state—the distribution rose from $2,378,752 to $2,689,674. The crowds which attended upon the "big" days, were, collectively speaking, the largest ever known, often ranging above 40,000 and 50,000. The Kentucky Derby, the Santa Anita handicap, the Belmont stakes, the Classic, the Preakness, the Suburban, the various great futurities, called out throngs which taxed the confines of the parks.

The "horse of the year" was adjudged to be the three-year-old chestnut colt Whirlaway, bred and owned by Warren Wright, of Calumet Farm, Lexington, Ky. He won 13 of 20 races, including the U.S. "triple crown" of Kentucky Derby, Preakness and Belmont, and the sum of $272,386. Next to him in prominence came the two-year-old bay colt Alsab, owned by Mrs. Albert Sabath, of Chicago, Ill. He won 15 of 22 races and $110,600, though ineligible for many of the richest stakes for his age. Through his last ten starts he was undefeated, and his feat of running a mile in 1:35⅘ when winning the Champagne stakes was regarded as one of the greatest in turf history. The leading older horse was the bay five-year-old Big Pebble, owned by Wm. E. Moore, of the Circle M Ranche, Sheridan, Wyo. He won 5 of 16 races, not a large percentage, but three of them were the $75,000 Hollywood Gold Cup, the $50,000 Widener handicap and the $25,000 Washington Park handicap.

The richest single event of the year was the Santa Anita handicap, worth $89,360 to the winner, the bay four-year-old Bay View, owned by Mrs. Anthony Pelleteri, of New Orleans, La. From the standpoint of winnings, however, the feature of the year was the success of Mr. Wright's Calumet Farm Stable, which won 70 races and the sum of $475,091, a new record of its kind in America and the world.

It was trained and managed by Ben A. Jones.

One of the most important developments of the season was the widespread revival of long-distance racing and the establishment of new records over such routes. Louis Tufano's three-year-old bay colt Market Wise lowered the mark for 2 mi. from 3:21⅘ to 3:20⅘; William Woodward's bay four-year-old Fenelon that for 2¼ mi. from 3:48⅘ to 3:47; and B. W. Hulsman's five-year-old Farragut that for 3 mi. from 5:19 to 5:15.

Harness Turf.—The most memorable event was the lowering of the world's record for trotting stallions, which had stood at 1:58¼ for 25 years previously, to 1:57¼ by the brown four-year-old colt Spencer Scott, owned by C. W. Phellis, of Greenwich, Conn., and bred by David M. Look, at Castleton, near Lexington, Ky. The premier winner of the year was the three-year-old brown colt Bill Gallon (1:59½), he taking the Hambletonian stake, the Kentucky futurity, etc., with earnings of approximately $40,000. He was owned by R. H. Johnston, Charlotte, N.C., and was bred at the Hanover Shoe Farms, Hanover, Pa. (J. L. HE.)

Great Britain.—Horse racing during 1941 was restricted to one quarter, approximately, of a normal season. It followed automatically, therefore, that the number of horses in training also showed a decrease. The effect on breeding, however, was not so serious as might appear, as the weeding-out process was confined largely to geldings.

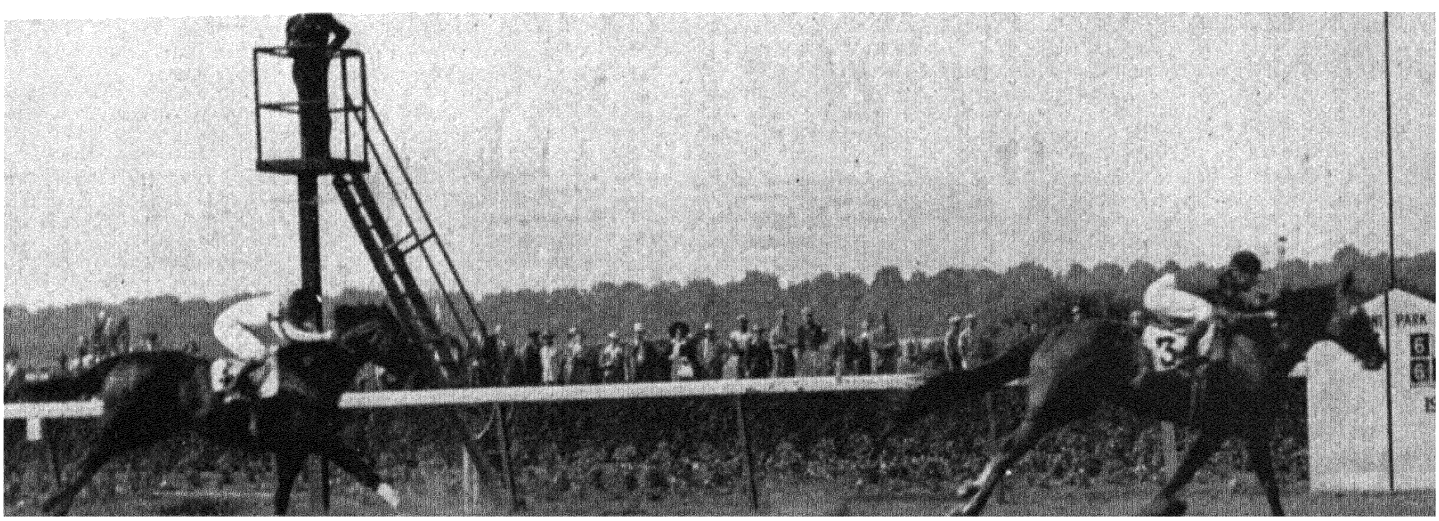
The king had the best season he had experienced so far, winning 11 races. His two-year-olds, Sun Chariot and Big Game, who won nine races between them, were leased from the National Stud. The king finished third in the list of winning owners, Lord Glanely, whose filly, Dancing Time, was successful in the One Thousand Guineas, coming first, and Mrs. Macdonald-Buchanan, who won the Derby with Owen Tudor, being second.

Owen Tudor was trained at Beckhampton by F. Darling, who also turned out Commotion to win the Oaks. Also in Darling's charge were Sun Chariot and Big Game, and the stable altogether won more than £19,000 in stakes. J. Lawson, the Manton trainer, and Capt. O. Bell, whose stables are at Lambourn, were second and third respectively in the list of winning trainers.

In the absence of G. Richards, who had a leg broken as the result of an accident at Salisbury in May, the jockeys' championship went to H. Wragg, who rode 71 winners—ten more than E. Smith.

Leading sire of the season was Lord Derby's good horse Hy-

WHIRLAWAY, outstanding horse of 1941, won the Belmont Stakes June 7 by a safe margin



perion, whose progeny won 35 races to the value of more than £22,500. Hyperion is the sire of Owen Tudor as well as of the St. Leger winner, Lord Portal's Sun Castle. Colombo, owned by Lord Glanely, who headed the list of winning breeders, was the second most successful sire of 1941. (A. K. B.)

Horses. The return of horses and mules, to take over a part of the work of urban motor deliveries and rural transportation, was forecast in 1941 following the diversion of the automobile industry to the fabrication of planes, tanks, guns and other war munitions, the cessation of the manufacture of automobiles for private use, and the drastic restrictions on tires, to conserve rubber for war uses. For more than 20 years the number of horses and mules in the United States had steadily declined. Horses had almost disappeared from city streets. On 6,096,799 United States farms in 1940, 1,567,405 tractors did the work formerly performed by draft animals. Horses and colts on the farms had declined to 10,086,971; the number of mules and mule colts, to 3,844,560.

The foregoing figures are from the United States census as of April 1, 1940. In 1941 there were approximately 14,000,000 horses and mules in the United States, as estimated by Wayne Dinsmore, secretary of the Horse and Mule Association of America and a foremost authority on the subject.

Of this number, Dinsmore reported, about 12,000,000 could be put to work in harness or under saddle in the spring of 1942. The remaining 2,000,000 consisted of animals under working age, race horses, horses in riding stables, stallions, jacks and jennets.

Although there was active inquiry by business firms as to the availability of horse power as a substitute for motor power in urban deliveries, there was little increase in the buying of draft animals.

Farmers who do not raise their own replacements do not generally buy horses and mules until March. There was still a number of months' wear in the tires on trucks in use at the end of 1941, and any substitution of horses for motor trucks required the use of horse-drawn types of vehicles which for many years had been manufactured only in very small numbers.

Light trucks suitable for urban, milk, laundry and such deliveries can be converted into horse-drawn vehicles, Dinsmore pointed out, by the addition of a pair of shafts.

Tires, too badly worn to stand up under motor-truck speeds, would, he said, give two or three more years of service under horse-power speed, as had been proved by tests at the South Dakota experiment station.

The 12,000,000 work animals, Dinsmore added, could by efficient management be made to do the work normally performed by 18,000,000 in peacetime. Prices for draft animals at the beginning of 1942, ranged from $65 to $300 a head. Good farm chunks, the type most in demand, were $125 to $150 a head.

In a talk at a meeting of horse and mule growers Dec. 3, 1941, Gen. John K. Herr, chief of cavalry, U.S. army, was reported to have said the most reliable information available to the army gave the number of horses in use in the Russian, German, Japanese and United States armies as shown in the table on this page.

	Cavalry	Draft and pack
Russian army	100,000	800,000
German army	50,000	910,000
Japanese army	50,000	325,000
United States army*	25,000	12,000

*U.S. Army had 13,000 additional horses in remount depots and administrative service.

The report of Gen. Herr's talk said further that the German army had 25 mechanized, 35 motorized and 245 marching divisions, with 4,000 horses to each infantry or marching division, or one horse to each four infantrymen, truck fleets being used to bring supplies from bases and horses being used for marching transportation. Replacements or increases of draft animals is a slow process, as three years are required from the time of breeding until a colt can be worked even as a two-year-old. (*See* also SHOWS.)

Since steel and iron are a first necessity of war and their use is closely restricted by the government it is interesting to note the quantity of metal required in a year for horses and mules in the United States. The amount is estimated at about 30,000 tons annually, for the manufacture of horseshoes and horseshoe nails. This for 12,000,000 work animals. The manufacture of 20,000 tractors would require about the same amount. (S. O. R.)

Horse Shows: *see* SHOWS.

Horticulture. The wine industry in France was entirely disrupted, and all horticultural conditions in Russia were violently dislocated because of the war. The bulb fields in the Netherlands in 1941 were intact. Germany and the Scandinavian countries were purchasing a considerable number of bulbs, but nevertheless a large surplus remained.

Horticulture in Great Britain was not broken down by any means, and many of its flower shows were in 1941 being continued. British garden magazines continued to be issued although greatly reduced in size. Commercial horticulture was carried on. A particular effort was made in Britain in 1941 to foster the sale of tulip bulbs to the United States and Canada. Growers as well as dealers were forbidden to sell tulips in Great Britain, either as bulbs or blooms, except outdoor flowers. It is estimated that more than 30,000,000 tulip bulbs were sent to the American continent in the autumn of 1941, which number, combined with the output of Canadian and American growers, about doubled the 1940 supply. Normal imports are about 125,000,000 bulbs. Moreover, the English bulbs, because of an intense heat wave and drought, were smaller than anticipated.

The economic embargo practically shut off all imports of lilies from Japan, although a few arrived in the United States before shipping ceased. Under normal conditions 20,000,000 lily bulbs are available in the U.S. each year, but in 1941 the total supply was hardly more than 600,000 bulbs. The Pacific coast produced about 250,000 lily bulbs, and approximately 150,000 came from Bermuda. Louisiana's crop of lily bulbs was reported short. All this indicated a noticeable lack of lilies at Easter in 1942, with the result that other flowers, especially azaleas and astilbes, would be offered as substitutes.

Reduced bulb importation meant that a new and lucrative business was being developed in the United States at the expense of other countries. The greatest number of American bulbs comes from the Pacific coast, but there is acreage of considerable size in Michigan, New York, Virginia and other states. The largest plantings in the northwest are in Oregon and Washington.

Large quantities of irises are grown in the southern part of Oregon. Regal lily production in the United States centred around Portland, Ore., and Puget sound. As a matter of fact, the United States was in 1941 independent of Japan so far as these lilies were concerned, and it appeared that the United States would gradually be successful in the growing of so-called Easter lilies. From 80% to 90% of the daffodil, iris, tulip and lily bulbs go to the florist.

South America has been largely responsible for the rapid development of the orchid industry, both in America and Europe, but hybridization became such a factor that the importation of wild plants seemed no longer very important. However, South America was expected to be the greatest source of rotenone, a

material which has become almost indispensable in the manufacture of various insecticides. Rotenone comes from several different South American plants and was in 1941 largely substituted for more poisonous materials like arsenate of lead. It is fatal to cold-blooded animals, and in South America it is used as a fish poison. Formerly most of the rotenone used came from the East Indies. South America and Mexico have great possibilities as a source of silk. Mulberry trees grow well there, and in some sections much attention was given in 1941 to the development of the silk industry.

In the United States unusual attention was given to herbs, because importations from foreign countries almost stopped. Digitalis and many other herbs were in short supply, but only herbs of high quality were desired, and no one could afford to undertake herb growing without being well acquainted with the methods required, in addition to having adequate knowledge as to markets.

California suffered from early and copious rains, which came unexpectedly in October. These rains slowed up the harvesting of seeds for at least two weeks, and this fact resulted in short crops. This applied to both vegetable and flower seeds, and it seemed likely that seeds of beets, carrots, onions, peas and parsnips would be somewhat scarce. Later reports revealed shortages in lettuce and radishes. It seemed probable that Drummond's phlox would be very scarce, and the seed crops of some grasses in California were smaller than for many years. The alfalfa seed crop in Arizona and California was smaller than half the amount produced in 1940, with a demand which was double that of that year.

It was indicated in 1941 that farmers and market gardeners would go along with the department of agriculture in Washington in its desire to increase the yield of farm crops, vegetables and small fruits in order that heavy shipment might be made to Great Britain and elsewhere. Farmers were asked to increase their vegetable garden crops for consumption in the home by 50%.

City residents were urged not to make vegetable gardens unless they knew just what they were doing, as the waste of seeds, fertilizers and spray materials might exceed the value of the crops grown. However, home garden makers in cities as well as in the suburbs were advised to continue the planting of flowers and shrubs. (*See* also BOTANY.) (E. I. F.)

Hospitals. The outstanding development in the hospital field for 1941 from the viewpoint of future potentialities would seem to be the closer association among the Americas. Since 1939, many representatives of Latin-American governments and of voluntary hospitals have attended administrative institutes in the United States and in Puerto Rico and have extensively visited hospitals in the United States and Canada. This *rapprochement* was crystallized in Sept. 1941 when, at the Atlantic City American Hospital association meeting, an Inter-American Hospital association, under the leadership of Dr. Malcolm T. MacEachern, was formed.

Another development of international interest was the meeting in London on Nov. 25, 1941, at the call of W. McAdam Eccles, London, of representatives of a large number of nations to consider replacing the International Hospital association by a new international body to function during the war and in the years to follow.

Sir Bernard Docker, chairman of the British Hospitals association, stated in the *Hospitals Year-Book, 1941,* "The future of voluntary hospitals is bound up inevitably with the future planning of the health services of the country." He outlined three fundamental principles for their continuance: (a) elasticity and freedom in their work; (b) payment by the state and municipalities for services rendered for them; (c) co-operation between the voluntary hospitals and the rate-aided or state-aided institutions.

The British ministry of health proposed to develop regionalization of hospital services on a broader scale than previously planned. Highly specialized services were to be provided at strategic centres and financial assistance would be forthcoming when necessary, though patients would be expected to pay when possible. A governmental committee under Lord Rushcliffe was to draw up a scale of salaries and emoluments for state registered nurses and for student nurses. To aid voluntary hospitals unable to meet the higher salaries for the civil nursing reserve decreed in April 1941, the government would advance certain financial assistance.

Hospitals in Canada, Australia, New Zealand and India and in more or less neutral countries were contending with defense preparations, with increased difficulties in obtaining equipment and supplies, and with augmented financial and personnel problems. In the United States the establishment of "priorities" did much to direct purchasing into controlled channels. The United States public health service was authorized to provide funds to assist three developments in nursing education: (1) to increase the number of students; (2) to prepare inactive graduate nurses for active duty; and (3) to aid postgraduate instruction in special fields.

Hospital service plans continued to make phenomenal growth in North America. A milestone was passed in September when the future co-ordination of these plans and the hospitals was assured by the inclusion of recognized plans as members of the American Hospital association and the setting up within the association of a Hospital Service Plan commission named by the plans themselves. An Institute for Hospital Service Plan Executives was held in Philadelphia in July. Other special institutes held for the first time were one on purchasing, held at Baltimore, and one on accounting, held at Indiana university.

Construction.—One of the finest new hospitals to be opened was the 600-bed children's hospital in Mexico City. Many military hospitals were built in the belligerent countries in 1941.

(G. H. AG.)

Houghton, Alanson Bigelow (1863–1941), U.S. diplomat, was born Oct. 10 at Cambridge, Mass. He served as U.S. ambassador to Germany and Great Britain during the years following World War I. Houghton died in South Dartmouth, Mass., Sept. 16. (See *Encyclopædia Britannica.*)

Housing. The number of local housing authorities co-operating with the United States Housing authority under the Wagner-Steagall Housing act of 1937 grew to over 640. Many projects passed from plans to construction to occupancy.

Table I.—*USHA—Local Authorities Program*

	Dec. 15, 1941	Dec. 19, 1940
Total number of projects	730	489
Total number of localities	541	221
Total number of dwelling units	182,649	158,234
Number units completed	103,602	35,130
Number under construction, not completed	40,905	80,422
Average over-all cost per dwelling unit including land and utilities	$4,213	$4,308
Average net construction cost per dwelling unit	2,695	2,717
North: Average monthly shelter rent per dwelling unit	15.40	14.77
South: Average monthly shelter rent per dwelling unit	11.32	10.06
Average family income in north	999	910
Average family income in south	767	651

As more than two-thirds of the 1937–38 slum clearance and public housing program had, by 1941, passed from the construction to the tenancy stage, it was possible to observe its tonic effect on neglected real estate and its far more important service to public health and citizenship.

Farm Security Administration.—The Farm Security administration of the department of agriculture did much for better housing on the farm. It works under four heads, to which has been added defense housing.

1. *The Tenant Purchase program,* under the Bankhead-Jones act of 1937, sanctioned 9,380 tenant-purchase loans during the first eleven months of 1941, totalling $52,500,000. The history of these loans shows that in nearly half the cases new farm homes are built. In the remainder old houses are modernized.

2. *Homestead developments,* 175 in number, form planned agricultural communities. At the end of 1941, 13,358 families had settled in them.

3. *The Rehabilitation program* was extended during 1941 to about 40,000 low-income farmers with loans totalling $96,000,000. Parts of these loans are used to provide sanitary privies, window screens and protected wells.

4. *Migratory Labour Camps.*—As of Nov. 30, 1941, FSA had 101 camps with accommodations for 20,607 families, either completed or under construction, in eastern as well as western states.

Defense Housing.—At the end of 1940, the official estimate was that 200,000 new family dwelling units were needed for workers transplanted for the national defense program. Enlargement of the defense program lifted the estimate to 600,000 by early summer. The enormous increase in war production planned during Dec. 1941 was expected to further increase the need for defense housing, but how much, few would venture to estimate.

Figures supplied by the Division of Defense Housing Co-ordination, OEM, make possible the summary in Table II.

Table II.—*Defense Housing by Public Agencies (Dec. 27, 1941)*

Total family dwelling units allocated	129,154	
Total family dwelling units completed		63,684
Total family dwelling units under construction		43,128
Total waiting for congressional appropriation		18,912
Total units for single persons allocated	11,051	
Total units for single persons completed		6,894

In addition to what is noted above, some 8,745 trailers and temporary prefabricated family units, as well as some temporary dormitories, were allotted to the FSA to handle as "stop-gap" housing until something else was available. It is also one of the public agencies building permanent housing, although not on a large scale.

The USHA slum clearance projects which had been converted to defense housing use numbered 129 in 1941 and contained 35,917 family dwelling units.

It should be reasonably clear that 1942 began with congress more than a year in arrears in supplying the funds for defense housing by public agencies. And also that public agencies are the only ones able to swing into mass production to produce adequate housing promptly. Further, the risk of financial loss inseparable from building for temporary use of uncertain duration will never be assumed by private business enterprise, nor by anything except the federal government, which must consider it part of the cost of the war.

The legislative and administrative history of 1941 in connection with defense housing is exceedingly complicated. In simplest terms, the defense housing co-ordinator determines the amount of new housing needed in the various defense areas and how much of it should be done by public agencies. Having obtained the president's approval, the list goes to the Federal Works agency (*q.v.*), whose administrator assigns it to one of several agencies. What congress has done and has not done is a story in itself. As the author of a magazine article put it, "Housing cannot win the war, but it can lose it." (*See* also BUILDING AND BUILDING INDUSTRY; BUSINESS REVIEW: *Industrial Groups;* CENSUS, 1940: *Housing Data;* FEDERAL HOUSING ADMINISTRATION; FEDERAL WORKS AGENCY; MUNICIPAL GOVERNMENT; WASHINGTON, D.C.

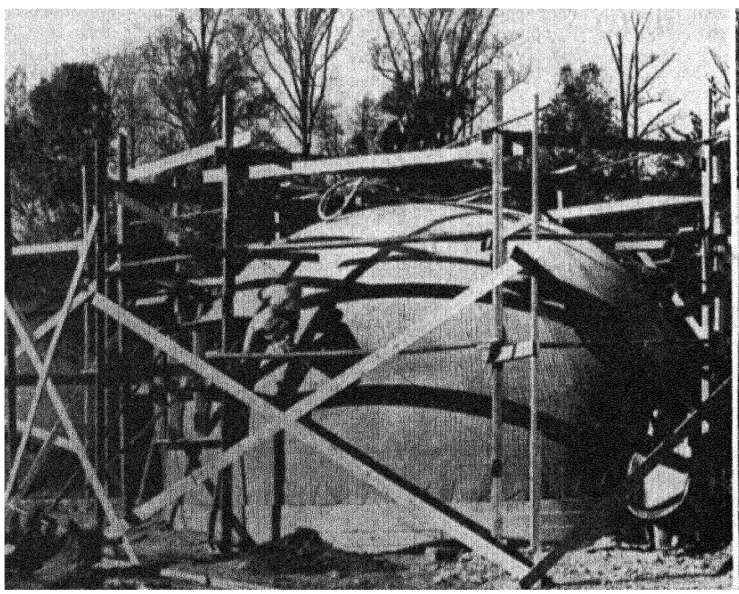
BIBLIOGRAPHY.—Mabel L. Walker and others, *Urban Blight and Slums* (1938); *U.S. Census of Housing* (1940); National Association of Housing Officials, *Housing Yearbook* (1941); Publications of the United States Housing authority, The Farm Security administration and the Division of Defense Housing Co-ordination. (E. E. Wo.)

Great Britain.—The only housing which was carried out during 1941 was to provide essential accommodation for workers in the newly built factories all over the country. Limitation of supplies of materials, of course, restricted not only the output in housing but also the type of design adopted.

A good deal was done by way of building hostels for workers with communal accommodation for feeding and recreation. Most of these buildings which were officially erected were from a standard design adapted to meet local requirements and materials available; timber was used, as well as bricks and precast concrete.

In order to simplify production the ministry of works and building set up a standardization committee which was gradually standardizing all kinds of units and articles of equipment for building. Bricks were reduced to two sizes; and of the numerous types of factory-made doors on the market only about six were permitted to be made. The same applied to locks, door furniture, windows and many other component parts of the house.

The effect of this standardization was expected not only to



Left: INFLATED BALLOONS, sprayed with sand and concrete, form the "framework" of new houses constructed in 1941 near Washington, D.C. to relieve the capital's housing shortage. After the concrete sets, the balloons are deflated and removed

Right: COMPLETED "balloon house" of four rooms, built at a cost of less than $3,000

A FINISHED HOUSE was built in 58 minutes at Grand Prairie, Tex. in 1941 by workers on a defense housing project

simplify and cheapen building for wartime purposes but also in the future. Regulations governing the output of various materials and articles concerned were likely to remain in force for a considerable time after the war in order to meet the program of building which would undoubtedly be embarked upon.

The destruction of houses by bombing and the closing down of all programs of building except those essential to wartime needs was bound to result in a great shortage of houses after the war. Another factor created an urgent demand for small houses whether they be state-built or otherwise; it would be possible under postwar economic conditions for only very few people to maintain large houses on the scale which was quite common before the war.

The Royal Institute of British Architects Re-construction committee issued a report on wartime and postwar housing generally. (See *R.I.B.A. Journal*, Sept. 1941.)

Many societies and associations were active in producing reports and initiating propaganda on the proper design of the small house. Although little housing work was actually being carried out during the war, there was every sign that the conditions brought about by the war were being utilized to improve and economize house building in the future. (F. R. Y.)

Housing Authority, U.S.: *see* FEDERAL WORKS AGENCY.

Hovey, Otis Ellis (1864–1941), U.S. civil engineer, was born April 9 in East Hardwick Vt. An authority on bridges and dams, Hovey supervised the building of emergency dams at the Panama canal and directed the building of the Bayonne bridge. He wrote many technical papers on engineering, and his two-volume work, *Movable Bridges* (1926–27), is a standard reference work on the subject. Hovey died in New York city April 15.

Howland Island: *see* SOUTH SEA AND EQUATORIAL ISLANDS.

Hoxie, Charles A. (1867–1941), U.S. inventor, was born in Constable, N.Y. He studied mechanical and electrical engineering and contributed to the development of telephony. In 1920 he developed an instrument which received transatlantic wireless messages 30 times faster than reception of messages handled by the most skilled operators. The General Electric company credited Hoxie with devising the first workable process for turning sound into light and recording it on transparent films.

His early experiments in this field led to creation of the Hoxie machine for recording sound on the same film that carried motion pictures.

Hoxie died in Alplaus, N.Y., on Oct. 13.

Hull, Cordell (1871–). U.S. statesman, was born Oct. 2 in Overton (now Pickett) county, Tenn. He was graduated from the Cumberland university law school in 1891 and served as a captain in the Spanish-American War. He served in congress from 1907 to 1931, except for one brief interval, 1921–23. He was elected to the senate in 1931 but resigned in 1933 to become President Roosevelt's secretary of state. Internationally, his name became closely associated with the "good neighbour" policy in South America and elsewhere; he was a consistent foe of aggression in settling disputes. He roundly denounced the Japanese attack on the Philippines and Pearl Harbor on Dec. 7, 1941, as a "treacherous and utterly unprovoked attack"; he further accused the Nipponese of having been "infamously false and fraudulent" by preparing the attack while their envoys were in the United States conducting purported peace negotiations. When Hans Thomsen, German chargé d'affaires, called on Hull Dec. 11, 1941, to inform him of Germany's declaration of war on the United States, he was kept waiting fifty minutes in an anteroom pending Hull's arrival. When the secretary finally arrived, he completely ignored Thomsen and strode into his office. He refused to see the German envoy, who was compelled to hand his war note to a state department aide.

Hungary. A kingdom in central Europe. Area (1940): 61,872 sq.mi.; pop.: 12,708,439. Capital: Budapest. Chief cities: Budapest (1,115,877); Szeged (131,893); Debrecen (122,517); Kolozsvár (100,844); Kecskemét (83,732). Religion: the majority are Roman Catholics, with strong Protestant and smaller Jewish and Greek minorities. King: throne vacant since 1918, royal functions exercised by regent Nicholas Horthy de Nagybanyá. Premier, László de Bárdossy.

History.—At the beginning of 1941, Hungary went through several changes of cabinet. On Jan. 27 the Hungarian foreign minister Count Stephen Csáky (*q.v.*), one of the staunch friends of the axis, died, and László de Bárdossy, minister to Rumania, was appointed in his stead. Opposition to the out-and-out pro-

axis course of the Hungarian government was in no way dead by that time. One of the outstanding Hungarian statesmen, Count Stephen Bethlen, who had been prime minister for many years, declared in a statement on Feb. 10 that "it is not logical to believe that the German form of dictatorship will be the final form of political life in other parts of Europe. Liberalism raised hundreds of millions of men to a higher standard of existence than ever before achieved, and progress of 100 years was greater than that of the previous 1,000 years." In spite of these sentiments the Hungarian government proceeded on its course of full-hearted adherence to the "new order." At the end of February the Yugoslav foreign minister arrived in Budapest to emphasize the lasting friendship between the two countries, expressed in their pact of nonaggression. But only a few weeks later Hungary was to become the starting point of the German armies in the invasion of Yugoslavia, and in spite of the pact of "everlasting friendship," concluded only a very few weeks before, Hungarian troops were to follow the German conquerors into Yugoslav territory to annex parts of the lands of the "friend." The premier of Hungary, Count Pál Teleki (*q.v.*), committed suicide on April 3, most people believed as a sign of protest against Hungary's complete vassalage to Germany and her entry into the war against Yugoslavia. His death was in vain. The foreign minister Bárdossy became prime minister, and on April 11, Hungarian troops invaded Yugoslavia in the wake of the German army to occupy the Voivodina, the rich and fertile plains of the Bacska between the Danube and the Tisza rivers with the important cities of Subotica, Sombor and Novi Sad. This military occupation was the beginning of a violent persecution of the Serb population of these territories; thousands of them were driven from their homes, and repeated resistance was quelled by indiscriminate mass executions. It was Hungary's intention to annex all the territories which had belonged to Hungary before 1918. An area of 8,000 sq.mi. with a population well over 1,000,000 was thus incorporated into Hungary. On April 24 Admiral Horthy met with Chancellor Hitler to discuss with him Hungary's role in the "new order." The integration of Hungary into this "new order" made rapid progress, expressing itself also in the continuous fascistization and anti-Semitism which became more pronounced under Bárdossy than it had even been previously. The out-and-out national socialist parties in Hungary did not, however, show sufficient strength to assume the government. They were weakened by internal splits. In addition to the Arrow Cross party, there existed a Hungarian national socialist party under Count Fidelius Palffy and the group led by the former prime minister, Bela Imredy. The large Slovakian minority in northwestern Hungary had formed its own party whose leader, Dvaresak, declared himself ready to cooperate with the Hungarians. The relations with Rumania remained unsatisfactory, because Hungary claimed the rest of Transylvania which had remained with Rumania by the second Vienna award of Aug. 30, 1940, while the Rumanians could never forget the forced cession of northern Transylvania to Hungary by the same award. It was frequently rumoured that the tension between Rumania and Hungary had grown so much that an armoured conflict between these two satellites of Germany was not regarded impossible.

With Germany's aggression against the soviet union, Hungary also declared itself in a state of war with the U.S.S.R., and Hungarian troops participated in the war. When Germany declared war on the United States Dec. 11, 1941, Hungary again followed Germany's example. One of the most prominent Hungarian leaders, Tibor von Eckhardt, who visited America during the year, founded in the fall of 1941 a Free Hungarian movement in the United States, declaring that the Hungarian people and its government were acting under German pressure, and calling on all Hungarians to fight for the independence of their nation. Eckhardt was joined by the former Hungarian minister to Washington, John Pelenyi, by Count Koloman Almassy and others. (*See* also WORLD WAR II.)

Education, Defense, Finance.—In the year 1938–39 Hungary had 8,103 elementary schools with 1,104,916 pupils, to which should be added the large number of continuation schools and special schools for industrial and commercial apprentices, and 263 secondary schools with 79,435 pupils. There are four universities, at Budapest, Kolozsvár, Pécs and Debrecen, and a number of specialized institutions of higher learning.

On Jan. 28, 1939, Hungary reintroduced compulsory military service for all men between 18 and 60. There were eight army corps in 1941, besides two motorized brigades and two cavalry brigades. The air force is very small, and there is no navy. Government expenditures on the armed forces in 1941 was estimated at 385,838,000 pengös.

The monetary unit is the pengö; its value equals 19.77 cents U.S. The revenues for 1941 were estimated at 2,036,000,000 pengös, the expenditure at 2,084,000,000 pengös. National debt on June 30, 1940, amounted to 2,514,000,000 pengös, bank notes in circulation to 1,357,000,000 pengös on Sept. 30, 1940; the metal reserve to 166,000,000 pengös.

Trade, Communication, Agriculture.—Exports in 1939 had a value of 605,000,000 pengös, imports of 488,000,000 pengös. In the first half of 1940 the following goods were principally imported: coal, machinery and apparatus, while the principal items for export were animals, wheat and poultry. About 60% of Hungary's trade was with Germany. In 1939 Hungary had 6,307 mi. of railroads, 3,625 mi. of state roads, 2,898 post offices, 6,902 mi. of telegraph lines and 20,976 mi. of telephone lines.

Hungary is predominantly an agricultural country, growing wheat, maize, sugar beets and grapes, and raising cattle, horses and pigs. Its main industries are agricultural industries, but there are also some iron and steel works. Hungary produces coal, lignite and bauxite. (*See* also RUMANIA.) (H. Ko.)

Huntziger, Charles Léon Clement (1880–1941), French general, was born June 25 in Brittany. A lieutenant colonel at the beginning of World War I, he was promoted to the rank of brigadier general and was stationed for a time in Syria. At the outbreak of war in 1939, he was in command of the 2nd army that faced the German onslaught at Sedan in May 1940. After the collapse of the French armies, Marshal Pétain assigned him to sign the armistices with Germany and Italy in June 1940. He was later made war minister and commander in chief of the French army. Gen. Huntziger was reported anti-British in his views, but it was said that he opposed the collaborationist schemes of Darlan and Laval for closer association with Hitler. In the fall of 1941 he was dispatched by Pétain to inspect Vichy's defenses in North Africa. It was then widely rumoured that he would replace Gen. Weygand as Vichy's proconsul in Africa. It was on his return from this trip that he was killed in a plane crash near Nîmes, France, Nov. 12.

Hymans, Paul (1865–1941), Belgian statesman, was born March 23 at Ixelles, Brussels. The son of a prominent member of the Belgian Royal academy, and a successful barrister in his own right, Hymans was appointed minister of state on the date that Belgium received the German ultimatum in 1914. He was one of the three ministers to draft his government's reply to the Germans. He served as minister of foreign affairs from 1918 to 1920, 1924 to 1925, 1927 to 1934 and from Nov. 1934 to March 1935, serving thereafter as minister without portfolio. He died in Nice, France, March 8. (See *Encyclopædia Britannica.*)

Hyvernat, (Eugene-Xavier-Louis) Henry (1858–1941), U.S. orientalist and educator, was born June 30 in Saint-Julien-de-Jarrêt, France. He received his doctor of divinity degree from the Pontifical university in Rome in 1882 and was ordained in the same year. He was professor of Assyriology and Egyptology at the Roman seminary and interpreter of oriental

languages at the Sacred Congregation de Propaganda Fide, Vatican City. In 1889 he went to the U.S., where he joined the faculty of the Catholic University in America, Washington, D.C., as professor of oriental languages. He later became professor of biblical archaeology and organized and headed the department of Semitic and Egyptian languages and literature. Mgr. Hyvernat contributed articles to the Catholic and Jewish encyclopaedias and wrote many books. He was a fellow of the American Academy of Arts and Sciences and in 1938 was named apostolic protonotary by the late Pope Pius XI. Mgr. Hyvernat died in Washington, D.C., May 29.

Ice Hockey. Winter's ace sport indoors and out attracted more than 5,000,000 spectators during 1941. Second only to basketball in popularity, hockey's annual expenditure for admissions to games, salaries and equipment topped $8,000,000. Professional games took first interest, but amateur teams also had large followings. Among the pro teams the Boston Bruins was a wonder team, victorious in winning the hockey championship of the world (the Stanley cup) and the national league title. In 23 straight games they bested their opponents until finally halted by the New York Rangers, winners of 19 games during the 1939–40 season. The Bruins finished first in the league race, for the third successive year, and led over the second-place Toronto Maple Leafs in the playoff for the cup. Later against the Detroit Red Wings, the Bruins took four straight in a four-out-of-seven sectional series.

The Washington Eagles took the championship of the Eastern league. After leading all the way the Cleveland Barons won the American League title, and the St. Louis Flyers won the title of the American association. With the Canadian colleges out of hockey competition because of the war, Princeton won the Quadrangular League race, replacing Yale, with Dartmouth third and Harvard last.

The Regina Rangers captured the Allen cup, emblematic of Canadian amateur hockey supremacy. Canada's junior championship and Memorial cup was won by Winnipeg. The St. Nicholas Hockey club team defeated the Clinton Hockey club for the well conducted national A.A.U. championship in New Haven, Conn., among six teams. Nine district associations in the A.A.U. held annual championship games in the eastern and midwestern states. N.Y. Exchange Brokers took the crown in the Metropolitan Hockey league. Manual Training high school was triumphant over all high schools in New York for the P.S.A.L. crown.

Many of the individual honours in professional hockey were scooped up by the Bruins, including the Hart trophy for the most valuable player to his team, awarded to Bill Cowley, centre. The Lady Byng trophy, for the best conduct on the ice, was presented to Bobby Bauer, Boston's right wing. Walter (Turk) Broda, of the Maple Leafs, won the goal-tending award, the George Vezina trophy, and the Calder trophy for the season's best rookie was voted to Johnny Quilty, of the Canadians. (J. B. P.)

Iceland. An island state of the north Atlantic. Area, 39,709 sq.mi.; pop. (1939 est.) 120,264. Capital, Reykjavik, the only large town (pop. in 1939, 38,219). Religion, Lutheran Christian. Rulers: hereditarily united with Denmark, Iceland became an independent state Dec. 1, 1918, legally united with Denmark only by recognition of a common king. After April 9, 1940, the executive power was wielded by the Icelandic ministry, with a regent, Sweinn Björnsson.

History.—Icelanders were beginning to adjust themselves in 1941 to the British military occupation, which had existed since May 10, 1940. It was difficult socially to handle thousands of soldiers in an island whose total population was only 120,000, and especially because the only city had a population of less than 40,000. Yet Britain's agreement to take all Iceland's export produce, at good prices, eased the economic situation.

But complications thickened when, early in July 1941, United States marines landed on the island, to be reenforced later by more U.S. troops in unknown number. The step was taken after consultations between the British and United States governments, and a direct exchange of messages between President Roosevelt and Prime Minister Hermann Jonasson of Iceland. Jonasson set up eight conditions for the admission of U.S. forces, and Roosevelt accepted them. Chiefly they were: recognition of Icelandic independence and sovereignty both at the time of occupation and after the war; organization of defense with sufficient force and materiel, and by picked men; arrangements to assure Iceland's markets and supplies.

British forces were undoubtedly diminished as the Americans arrived, but were not entirely withdrawn. Relief of the British and closer guarding by the United States of its sea lanes were the primary reasons for the move. The question remained undetermined whether Iceland belongs in the western hemisphere or the eastern. By August the Americans were comfortably established in heated corrugated iron huts, with ample supplies of clothing and food.

The threat from Germany was dramatized in Aug. 1941, when a nazi bomber appeared, and many times later as damaged merchant naval vessels limped into the harbour of Reykjavik. Despite the obvious danger, and despite a favourable commercial agreement with the United States reached in August, people were discontented with conditions, especially with rising living costs. Disputes increased, and in October the ministry resigned. Nine days later (Oct. 31) it returned to office after an appeal from the regent.

A BRITISH GUNNER (left) and a U.S. marine exchanging greetings in Reykjavik during the landing of the U.S. forces in Iceland July 7, 1941

Finance.—Monetary unit: krón=18 U.S. cents (1939); in 1939 government revenues were 19,930,879 krónur; expenditures, 19,378,318 kr.; national debt, 56,648,000 kr.; notes in circulation, 14,000,000 kr.; gold reserve, 5,762,000 kr.; bank capital and reserves, 17,577,000 kr.; bank deposits, 76,720,000 kr.; total bank funds, 48,997,000 kr.

Trade.—Exports in 1939 totalled 69,654,000 kr.; chief articles of export were fish, salted and dried (17,228,000 kr.); fish oil (12,491,000 kr.); herring (11,800,000 kr.); fresh fish (8,988,000 kr.); fish flour (7,291,000 kr.); sheepskins, etc. (3,309,000). Imports in 1939 totalled 61,639,000 kr. The chief imports were gasoline (9,672,000 kr.); textile manufactures (6,583,000 kr.); metal wares (5,182,000 kr.); wood (5,483,000 kr.); machines (4,727,000 kr.); automobiles, etc. (3,638,000 kr.). Great Britain took most of Iceland's exports in 1939 (11,794,000 kr.), followed by Sweden (8,517,000 kr.); Denmark (7,708,000 kr.); Germany (7,488,000 kr.) and the United States (7,378,000 kr.). Great Britain also was first in supplying Iceland's imports, with goods valued at 13,785,000 kr. Denmark was second (12,684,000 kr.) and Germany was third (10,125,000 kr.).

Communication.—Highways (1936) totalled 2,728 mi., of which 1,736 mi. were improved and 992 mi. were unimproved. Miles of telegraph lines (1939): 9,700.

Agriculture.—In 1938 the chief products with their yields in tons were as follows: hay (269,024), potatoes (13,160), turnips (2,856). The 1938 census of livestock showed 591,948 sheep, 89,664 poultry, 49,018 horses, 36,696 cattle, 5,337 fox, mink, etc., 1,740 goats, 632 pigs. (F. D. S.)

Ice Skating.

Ralph McCreath, of Toronto, scored 1,575·8 points against 1,575 for Eugene Turner, of Los Angeles, the winner in 1940, for the North American figure skating championship. The excellent free skating and spectacular jumps of McCreath, of Toronto, won the title. Miss Rose Thacker, of Winnipeg, retained her women's North American crown, and Miss Eleanor O'Meara, of Toronto, and McCreath surpassed the others in winning the North American pair championship.

In the national championship of the U.S., Turner won the men's singles for the second year in a row, and Miss Jane Vaughn, University of Pennsylvania coed, triumphed in the women's competition. The national pairs title was won by Miss Donna Atwood and Turner, both from the west coast.

First among speed skaters in the U.S. was Ken Bartholomew, of Minneapolis, who won the two most important outdoor championships, the North American and the National, dethroning the great Leo Freisinger, of Chicago, the Olympic champion. The senior women's laurels went to Miss Carmelita Landry, of Fitchburg, Mass. Ted Ellenwood, of Ft. Johnson, N.Y., won the men's Middle Atlantic and N.Y. state titles, and Miss Virginia Jahn, of Cresskill, N.J. took the women's Middle Atlantic crown.

(J. B. P.)

Idaho.

One of the far northwestern states, belonging to the group regionally designated as the U.S. Pacific northwest; admitted to the union July 3, 1890; popularly known as the "Gem state." Area, 83,557 sq.mi.; pop. (1940) 524,873 (rural 66·3%, urban 33·7%). There were 3,638 Indians in the state. Capital, Boise (26,130). Other principal cities are Pocatello (18,133), Idaho Falls (15,024), Nampa (12,149) and Twin Falls (11,851).

History.—No general election was held in 1941 and there were no sessions of the legislature. State officers in 1941 (terms expiring in 1942) were as follows: governor, Chase A. Clark; lieutenant governor, Charles C. Gossett; secretary of state, George H. Curtis; attorney general, Bert H. Miller; auditor, Calvin E. Wright; treasurer, Myrtle P. Enking; superintendent of public instruction, C. E. Roberts; mine inspector, Arthur Campbell.

Education.—School population in 1941 was 120,987. There were 86,829 pupils and 3,107 teachers in 1,012 elementary schools, and 34,158 students and 1,405 teachers in 183 accredited high schools. The state university is at Moscow, with a student enrolment of 3,770 in 1941, and 275 members of faculty; the southern branch at Pocatello had 974 students and 85 teachers. There are two state normal schools, one at Lewiston and one at Albion; the combined enrolment in 1941 was 1,043 and there were 63 faculty members.

Correction.—The industrial school at St. Anthony had 174 inmates in 1941. The penitentiary at Boise had 243 inmates on Dec. 31; expense for 1941 was $137,115.

Communication.—Idaho in 1941 had 4,857 mi. of state highways, built at a cost of $116,854,475; also 33,000 mi. of county and forest roads. There were approximately 2,894 mi. of railroads, four major airports and many private and forest-service landing fields. In 1941 there were 58,169 telephones in use.

Banking and Finance.—On Dec. 31, 1941, there were 33 state banks with capital of $1,275,100; deposits of $24,242,249 and resources of $28,971,258. Fifty-five national banks had capital of $4,055,000 and resources of $107,088,288. The state's assessed valuation for 1941 was $393,234,561. State treasurer's receipts for 1941 were $35,261,792; disbursements, $34,305,764; balance on Dec. 31, $6,929,007. State indebtedness was $3,138,636.

Agriculture.—The 1941 farm census reported 43,663 farms with a valuation of $339,194,391. The total value of crops in 1941 was $89,587,000, as compared with $61,744,000 in 1940.

Table I.—*Principal Agricultural Products of Idaho, 1941 and 1940*

Crop	1941	1940
Wheat, bu.	27,822,000	24,383,000
Corn, bu.	2,385,000	2,070,000
Oats, bu.	6,680,000	5,904,000
Barley, bu.	11,400,000	8,250,000
Sugar beets, tons	820,000	1,141,000
Dry beans, 100-lb. bags	1,888,000	1,701,000
Seed peas, bu.	1,694,000	910,000
Hay (all kinds), tons	2,301,000	2,415,000
Potatoes, bu.	27,450,000	33,280,000

Manufacturing.—There were 533 manufacturing establishments (1940) with 12,797 workers and pay roll of $16,249,685.

Mineral Production.—Total value of mineral production for 1941 was $41,357,800 for the five leading metals. In 1941 there was the largest output of gold since 1871, and the largest production of zinc in the history of the state.

Table II.—*Principal Mineral Products of Idaho, 1941 and 1940*

Mineral	Value, 1941	Value, 1940
Gold	$ 5,250,000	$ 5,075,000
Silver	11,808,000	12,250,000
Copper	912,600	757,100
Lead	11,592,000	10,380,000
Zinc	11,795,999	9,184,500

(B. De.)

Illinois.

A north central state of the United States, admitted to the union in 1818, nicknamed the "Sucker state," sometimes called the "Prairie state." Total area, 56,400 sq.mi. of which 55,947 sq.mi. are land. Pop. (1940) 7,897,241, including 3,967,481 males and 3,929,760 females; 7,503,987 white, 393,254 nonwhite. Population classed as urban was 5,809,650, rural not on farms 1,121,823, rural farm 965,768. Springfield, the state capital, with a population of 75,503, is the fifth Illinois city in size. Chicago (3,396,808) is the largest Illinois city, followed by Peoria (105,087); Rockford (84,637); East St. Louis (75,609).

History.—War and preparation for it overshadowed political life in Illinois in 1941. The year closed with the general assembly in special session to consider new legislation to enable the state to co-operate better with the national government; appropriations of $16,000,000 were asked for this purpose by Governor Dwight H. Green. The previous session of the legislature passed 650 bills, 88 of which were vetoed by the governor. The legislature refused to carry out the constitutional mandate to reapportion the legislative and congressional representation of the state, with the result that Illinois legislative and congressional districts in 1941 were still based on the census of 1900. Thus the population of Chicago was underrepresented both at Springfield and Washington. The state sales tax was reduced from three to two cents per dollar, but improved business prevented a decrease of revenue. Additional taxes were laid on cig-

arettes, liquor and oil. Women were made eligible to serve on grand juries, and election bribers were made liable to the same punishment as bribe takers. Appropriations aggregated slightly more than $510,000,000 for the legislative biennium.

Hugh W. Cross was lieutenant governor of Illinois in 1941; Edward J. Hughes, lone Democrat official, secretary of state; Arthur C. Lueder, auditor; Warren Wright, treasurer; and George F. Barrett, attorney general.

Education.—Illinois public schools are administered by some 12,000 local boards, which levy the bulk of the taxes for their support. Over this localized system there is a state school superintendent elected by popular vote in "off years." A state distributive fund supplements local taxation. In 1941 this fund took 12.87¢ of every dollar of state revenue. It was distributed as follows: for local school aid, $16,161,659; for the University of Illinois, $8,693,313; for normal schools, $3,155,676; for handicapped children, $1,653,100; for vocational education and rehabilitation $326,645; for blind and deaf schools, $552,688; for interest on school fund, $57,000.

In 1939 total enrolment of schools was 1,314,178, of whom 372,471 were in high schools. These figures do not include parochial and private schools. (*See* also ILLINOIS, UNIVERSITY OF.)

Public Welfare, Charities, Correction.—Increase of employment in the first 16 months after the national defense program was launched had taken 345,339 off relief rolls in Illinois by the latter part of 1941. On Oct. 1, 1941, 297,206 persons were still in receipt of general relief, however, and there were 213,375 working on WPA projects; 148,128 were receiving old-age assistance, 17,057 mothers' pensions and 7,277 pensions for the blind. Total expenditures by the state for relief and welfare were $237,790,316 for the fiscal year. Illinois maintained 10 hospitals for the insane in 1941 and two for the feeble minded. There were seven penal institutions, including two main penitentiaries and a woman's reformatory.

The state also supported schools for the blind and deaf and other institutions of a benevolent nature. Including private hospitals and orphanages there were about 475 institutions for various sorts of philanthropy apart from schools and libraries. The Illinois old-age pension system established in 1935 was a greater responsibility to the state in 1941 than were the schools, as the pensions, amounting to $40 per month, were paid altogether out of general state revenues.

Communication.—The state highway department of Illinois had under its supervision in 1941, 68,549 mi. of road, with a yearly expenditure for all purposes of $68,549,000. The state's railroad mileage was 11,981.

Finance and Banking.—The tax burden in Illinois in 1941, exclusive of federal taxes, was $619,025,000, or $78.24 per capita. Local taxes amounted to $359,653,000, state taxes to $259,372,000. At the end of the fiscal year 1940–41, the Illinois treasury had a balance of $289,520,944, but of this amount $211,305,902 belonged to the unemployment insurance fund. The sales tax, which yielded $101,760,954, was the state's greatest source of revenue. The gross debt of the state June 30, 1941, was $160,783,000, the net debt, $153,442,000. There were 329 national banks in Illinois with deposits of $2,864,376,000, loans of $745,220,000 and investments of $1,573,220,000. State banks and trust companies numbered 512, with deposits of $1,164,541,000; loans, $308,416,000; investments, $546,423,000.

Agriculture.—The value of Illinois farm crops in 1941 was $497,762,000, harvested from 18,617,000 acres. Combined cash income of Illinois farms from all sources was $644,000,000, including $36,000,000 of government payments under AAA.

Table I.—*Leading Agricultural Products of Illinois, 1941 and 1940*

Crop	1941	1940
Corn, bu.	401,362,000	328,735,000
Soybeans, bu.	49,128,000	34,612,000
Oats, bu.	154,112,000	148,320,000
Winter wheat, bu.	55,300,000	38,925,000
Tame hay, tons	3,619,000	4,237,000

Manufacturing.—The value of products manufactured in Illinois in 1939, according to the U.S. biennial census, was $4,794,860,733; the number employed was 688,800; total wages and salaries were $988,453,881. The principal industries and the value of their products were as follows: meat packing, $479,501,224; steelworks and rolling mills, $207,301,815; petroleum refining, $122,933,528; tractors, $121,550,621.

The third great government munitions plant in Illinois, at Crab Orchard lake near Carbondale in the southwestern part of the state, was dedicated Oct. 19, 1941. The $51,000,000 ordnance works at Kankakee began production of explosives Sept. 26, and the first fuses were assembled at the great Elwood plant Dec. 2. These giant plants, covering thousands of acres each, were but open field and forest late in 1940. Activity there was typical of armament production, public and private, in every Illinois industrial district.

Mineral Production.—The total value of minerals produced in Illinois in 1939 was $210,295,738.

Table II.—*Production of Coal and Petroleum in Illinois, 1940 and 1939*

	1940	1939
Bituminous coal, tons	45,977,479	47,627,454
Petroleum, bbl.	146,788,000	94,912,000

Estimated oil production for 1941 was 140,000,000 barrels. Estimated coal production was 47,000,000 tons. In 1939 the value of leading minerals was as follows: petroleum, $101,200,000; coal, $76,178,000; pig iron, $57,718,814; coke, $11,963,932; stone, $7,820,589. (L. H. L.)

Illinois, University of. An institution of higher education at Urbana, Ill. Enrolment in the university for the first semester of 1941–42 was 13,060 (Nov. 1, 1941 count), a drop of 7.6% from that of the first semester, 1940–41. The decrease was attributed to the selective service act and to better industrial opportunities for students. During 1941 the university conducted, at federal expense, defense training classes in engineering, science and industrial management for 5,000 workers in several parts of the state. University staff members were released for special defense activities. Military training was given new emphasis, with 4,243 cadets, exclusive of military bands, in the R.O.T.C. and 595 in the advanced course leading to army commissions. Some 4,000 alumni, commissioned from the R.O.T.C., were on active duty.

The university's facilities were extended during the year by expansion of the Illinois Medical centre on Chicago's west side. To the colleges of medicine, dentistry and pharmacy were added the Illinois Educational and Research hospital and the Institute for Crippled Children, taken over from the state department of public welfare. Presbyterian hospital became affiliated with the university, and the staff of Rush Medical college was joined to that of the university. A student union was opened for Chicago students. At Urbana the $1,500,000 Illini Union building was opened in February and was dedicated by Gov. Dwight H. Green in November. A much-needed power plant was put into use. Total value of the university's plant, not including the additions at Chicago, reached $36,781,884.

Total enrolment for the 12-month period ending June 1, 1941, was 17,392. This figure does not include some 1,200 correspondence students. The university staff totalled 2,247 persons. The library, fifth in size among those of U.S. educational institutions, contained a total of 1,635,657 items, of which 1,262,046 were bound volumes and the rest pamphlets, maps and sheet music. The university budget for 1941–42 was $10,436,652, of which $6,506,462 was from tax revenues.

Illiteracy. During 1941, because of wars and upheavals over wide areas of the globe, there was a net loss in the world's efforts to reduce illiteracy and in other movements toward popular education. Germany, which before World War I had established a high record in all forms of education, had deteriorated because of concentration on military enterprises.

In the countries of Czechoslovakia, Poland, Holland, Belgium, Norway, France and the Balkans there had been such national disturbances because of invasion that education suffered along with all other public services. China, with the greatest number of illiterates of any nation in the world, was compelled by the Japanese invasion to abandon her efforts to teach the masses to read through a simplified "alphabet" of 1,000 characters. The Union of Soviet Socialist Republics, where mass education had reduced illiteracy from the 75% of 1895 to less than 30% in 1937, had to concentrate all its resources on fighting the war with Germany. All the countries of eastern and southern Europe were too busy with wars and the threats of war to make any concerted efforts toward popular education and national literacy. India and Egypt reported illiteracy of over 80% of the population. In late years Mexico and other Latin American nations had been making heroic efforts to improve the education of their people, but illiteracy in all these countries continued to be exceedingly high in 1941. In Mexico nearly 60% of the population over ten years of age was unable to read or write.

The United States of America was one of the few countries to continue to make progress in the reduction of illiteracy during 1941. An effort to make the whole nation literate continued to be the chief item in the adult education program of the Work Projects administration, under which approximately 2,000,000 people were taught to read and write in the years from 1933–41.

During 1941 this administration added special programs for the reduction of illiteracy among registered aliens and among selective service registrants rejected for military service because of inability to pass a fourth grade examination. In 1930—the last year for which comprehensive figures were available—the U.S. had 4,283,753 illiterates over ten years of age, or 4.3% of the population of that age.

While Negroes showed the highest illiteracy of any large group of the U.S. population (16.3%), they made the greatest recent progress. At the time of emancipation in 1863 it was estimated that of the 4,500,000 slaves and "free persons of colour" in the U.S. less than 5% could read and write; in 1940 the 13,000,000 U.S. Negroes had an estimated literacy rate above 85%. (*See* also CENSUS, 1940.)

Unfortunately the 1940 census figures do not include illiteracy statistics, since the latest census form substituted a query concerning highest grade of school completed for the customary record on illiteracy. It is estimated, however, that the U.S. population over ten years of age was 97% literate in 1941.

Immigration and Emigration, U.S.

The immigration and emigration of aliens are controlled in the United States by treaties, legislation and administrative regulations. The principal treaty and laws affecting such control are mentioned below. The treaty with China of 1880 and the Chinese Exclusion act of 1882, as amended, virtually prohibited the permanent admission of aliens of the Chinese race. The act of Feb. 5, 1917, provided general tests of admissibility to the United States and the procedure for the inspection of applicants for admission. Under this act aliens who do not satisfy certain mental, physical, moral and economic requirements are excluded and deported from the United States. The act of May 26, 1924 provided for consular inspection of applicants for admission to the United States, specifies the requirements for immigration visas, and permits only a limited number of immigrants of each of certain nationalities to be admitted to the United States each year for permanent residence.

It should be noted that the figures presented in this table do not include those aliens who registered as alien seamen or those who registered through consular officials.

*Includes the territories of Alaska and Hawaii, District of Columbia, Puerto Rico and the Virgin Islands.

†Does not include Italian African possessions.

‡Includes Russia in Asia.

§Does not include Northern Ireland, British Asiatic possessions, British Pacific possessions, British African possessions, British West Indies and British Guiana.

¶Does not include Chosen and Japanese Pacific possessions.

These restrictions do not apply to specified "nonquota" groups, including, among others, returning alien residents and persons born in Canada, Newfoundland, or an independent American country.

Alien Registration.—The Alien Registration act, 1940, required that a record be made and kept current of aliens in the United States. All aliens (except foreign government officials and members of their families) who remain in the United States, including Alaska, Hawaii, Puerto Rico and the Virgin Islands, 30 days or longer, must be registered, and, if 14 years of age or over, be fingerprinted. The number of aliens thus shown to be in the United States and its territories as of Oct. 24, 1941, was 5,138,126.

Emergency Control Over Aliens.—Effective Dec. 1, 1941, additional restrictions were placed upon the entry and exit of aliens generally. Per-

[13]Includes those registering as aliens who make no return for country of birth.

mits to enter or depart were required, unless the aliens concerned fell within certain specified groups of emergency cases. An alien applicant for entry must be sponsored by U.S. citizens or resident aliens. Appropriate procedural forms might be obtained from the department of state or the immigration and naturalization service. Aliens whose entry or departure would be prejudicial to the interests of the United States were not allowed to enter or depart.

After Dec. 7, 1941, natives, citizens, denizens, or subjects of nations with which the United States was at war, 14 years of age and upward, in the United States and not naturalized, were declared to be alien enemies. As such their movements and activities within the United States were substantially restricted. Among other prohibitions, they might not give information to the enemy or interfere by word or deed with the defenses, political processes, or public opinions of the United States. They were barred from entering restricted areas. Nor might they make any air flight, or move from place to place, or change their abodes or occupations without compliance with such regulations as might be promulgated. Moreover, they were required to turn over to the government certain types of property, including among others, firearms, short-wave radio receiving sets and cameras, which might be used in espionage or subversive activity.

Alien enemies considered dangerous or who violated the restrictions were subject to summary apprehension. They were then to be given hearings to determine whether they should be interned permanently, released under bond, or released without bond.

Activities of Immigration Officers.—The administration of the laws relating to immigration and emigration of aliens is under the direction of the special assistant to the attorney general in charge of the immigration and naturalization service, except insofar as the issuance of permits to enter and depart is under the control of the secretary of state.

Officers of the immigration and naturalization service passed upon 40,424,978 alien and citizen entries into the United States during the fiscal year ended June 30, 1941, of which 38,974,008 were across the land borders. This latter number included 4,096,470 alien entries and 11,357,962 citizen entries from Canada, and 14,521,163 alien entries and 8,998,413 citizen entries from Mexico. Aliens numbering 51,776 entered the United States for permanent residence, and 17,115 departed for residence elsewhere. During the period 2,929 aliens were excluded. Of those entering for permanent residence 26,541 were from Europe, 22,445 from the Americas, and 2,790 from Asiatic and other sources.

Immigration officers boarded 39,739 vessels and inspected 1,846,913 alien and citizen seamen, both arriving and departing. They also examined the passengers and crews of 7,906 aircraft. Immigration border patrol officers patrolled 12,207,780 mi., examined 2,001,891 conveyances, and questioned 3,518,353 persons. As a result of this activity 12,649 persons were apprehended and 210 conveyances seized.

During the fiscal year 1941, 4,407 aliens were deported, while 6,531 aliens who were adjudged deportable were allowed to depart at their own expense without warrants for deportation. (*See* also CENSUS, 1940; REFUGEES.) (L. B. S.)

India. A subcontinent projecting from the mainland of Asia, India lies between the 8th and the 37th degrees of north latitude. It comprises 11 major or "autonomous" provinces, five minor areas directly administered by the central British government, and between 500 and 600 states under Indian rulers. The latter are scattered about the subcontinent and vary greatly in size and importance, as well as in the powers enjoyed by their chiefs. British India (the 16 major provinces and minor areas) has its capital at New Delhi and is under a viceroy and governor general (the Marquess of Linlithgow after April 1936), who is also the representative of the crown in its relations with the native states. The total area is 1,575,187 sq.mi., of which the native states and agencies total 712,508 sq.mi.; pop. (est. 1941 census) 388,800,000. Chief cities (pop. census 1931): Calcutta (1,485,582); Bombay (1,161,383); Madras (647,230); Hyderabad (466,894); Delhi (447,442); Lahore (429,747). Languages, Hindi, Bengali and Urdu the most important; religions, Hinduism (approx. two-thirds), Mohammedan (approx. one-fifth). Ruler, George VI, emperor.

History.—The political stalemate from which India suffered in 1940 continued through 1941. In Aug. 1941 the viceroy (the Marquess of Linlithgow) had held out an olive branch, offering to enlarge his executive council by bringing in more Indians and to set up a war advisory council of leading Indians; at the same time he promised that, after the war, a body representative of the principal elements in Indian national life would be convoked to frame a constitution for the country. This offer was rejected both by the congress (mainly composed of Hindu nationalists) and by the Moslem league; by the former on the ground that they should first have a guarantee that India would be completely freed from the British connection; by the latter, as they would not tolerate any constitution with a Hindu majority. The viceroy, complaining with some justice that no constructive proposal ever came from the other side, expressed his inability to make any further offer; whereupon Mohandas Gandhi (*q.v.*) initiated a pacifist campaign, with instructions to his supporters to stir up popular feeling against the national war effort. As the agitation spread, the government considered it had no alternative except to arrest the leading spirits, including the president of the congress and Pandit Jawaharlal Nehru. In vain Leopold Amery, the secretary of state for India, arguing that any future federal government must rest on an agreement between the main elements in the nation, pleaded for a united front against the nazi danger, now threatening the east as well as the west. The congress retorted that if India were made independent Gandhi's nonviolent soul-force would soon put an end to the war. The response of the president of the Moslem league (Mahomed Ali Jinnah) was equally uncompromising. He spurned any idea of co-operation with the Hindus, as it would inevitably mean majority rule—a democratic principle which he categorically repudiated. If the congress should prevail in its demand for independence, he insisted that India must be partitioned, and out of its northwestern and northeastern zones a new Moslem state (Pakistan, or land of purity) must be created, with complete autonomy and full control over its own foreign and domestic affairs. In December a fresh start was attempted by the government, and the passive-resistance prisoners were released. To judge by the tone of a speech which Nehru broadcast immediately on leaving prison, no change of heart followed; but all this mimic warfare collapsed when Japan drew the sword and her bombers raided Rangoon. The country was already wearying of the wrangle, and the membership of the congress shrank from 4,500,000 before the war to barely 1,500,000 in 1941, while impatience increased

among the Moslems with Jinnah's dictatorial methods. In March 1941 a conference of the Indian Liberals asked for a reconstruction of the viceroy's cabinet; and the princes pressed for a war advisory council. This gave the government an opening for reviving and revising its former offer; and in July it was announced that the viceroy's cabinet would be enlarged from 7 to 12 members with a majority of Indians, and that a national defense council of about 30 would be formed, to include representatives of the states as well as of the British provinces. The new portfolios were given, as Amery claimed, to anything but "yes-men"; yet within a month the Moslem league compelled the prime ministers of Punjab and Assam to resign from the defense council because they had not obtained its permission before accepting office. The Moslem premier of Bengal shortly followed suit, although at the same time he left the league in protest against Jinnah's high-handedness. Undisturbed by this contretemps, the defense council held its first meeting on Oct. 6, and appeared to function satisfactorily. In July another interesting step had been taken in the exchange of diplomatic representatives between India and the U.S.

India's War Effort.—While the wordy war of politics droned on, the people were rapidly realizing the stern reality of Hitler's war. From Europe hostilities had spread to Syria, Iraq and ultimately Iran, bringing the danger nearer and nearer home. It also brought the Indian fighting men more and more to the front, where they were making good in every field. They bore their full share of battle in Abyssinia, Libya and the middle east, having particularly distinguished themselves both in the attack on Sidi Barrani and in the second advance in Cyrenaica (Dec. 1941). A young Rajput noble, nephew of "Ranji" of cricket renown, was given the D.S.O. for gallant conduct in Libya, and two Indian officers (one posthumously) won the Victoria Cross. The royal Indian navy, with its youth renewed, not only was doing useful work in its home waters but also was taking a hand in the battle of the Atlantic. Sir Claude Auchinleck (*q.v.*), with 37 years of Indian service, became commander in chief in the spring of 1941; his appointment was popular but short, as in July he exchanged posts with General Sir Archibald Wavell (*q.v.*) and took over the conduct of the war in the middle east.

During 1941 the role of India as a reservoir of men and military supplies developed rapidly. Recruits kept pouring in to the Indian regiments, latterly at the rate of 50,000 a month; and by September 1,000,000 men were under arms, of whom more than 100,000 were serving overseas. The territorial force was given the option of being converted into regular units, and 75% of the men volunteered for full service. Air-raid precaution work was eagerly taken up in the large cities, and in Calcutta a civic guard was enrolled for that purpose and for auxiliary police duties. As to supplies, great strides were made in the production of munitions of almost every kind—rifles, machine guns, shells, fuses, mortar bombs, anti-tank mines, Bren-gun parts and nitric acid. Broadcasting in July, the supply member of council disclosed that the output of guns was five times greater and of filled shells 24 times greater than in peacetime. Besides the needs of its own forces the country had met orders for 60,000 filled shells and 150,000,000 rounds of small-arm ammunition. Thanks to the provision by the United States of certain essential machine tools, aircraft were being assembled, and the first plane to be thus completed did its test flight in the summer. Plans matured for training 300 pilots and 2,000 mechanics annually. The opening of a toluene plant marked the first stage in making India self-contained in the production of high explosives. The shipyards also were busy, constructing small craft, from mine sweepers to lifeboats.

BOMB-PROOF APARTMENTS were advertised by a provident renting agent of Bombay in 1941

The monthly production of steel increased by 2,000 tons through the utilization of scrap. The jute industry gave the world 500,000,000 sandbags in the first year of the war, while 324,000,000 yd. of cloth for military clothing were undertaken in 1941. The great expansion of ordnance and general engineering plant was stimulated by the visit of the Roger mission from the British ministry of supply (winter, 1940), and by the Eastern Group conference held at Delhi in Oct. 1940. From the latter there emerged an Eastern Group supply council, which aimed at supplying from the industrial capacity within its area the whole of the military requirements of that part of the British commonwealth which lies outside the Suez canal. India, with its geographical and strategical advantages, was in 1941 sending a flow of supplies west and east—up the Persian gulf to the U.S.S.R. and along the Burma road to China. Reference to the gifts of the princes and people to every type of war charity is superfluous; every newspaper carried on the daily tale of their spontaneous generosity.

Despite ample assistance from the British treasury, the strain of war on India's finances was considerable. The central budget showed a deficit of more than £6,000,000 in 1940–41, and more than £15,000,000 in 1941–42. The figures would have been more serious were it not for the substantial contributions at last being made by the railway revenue—about £7,500,000 in each of the two years. Higher rates and fares, the curtailment of coastal steamer services and the effect of more expensive gasoline on road competition, all contributed to this result. To balance the 1941–42 account required the borrowing of about £10,000,000; the excess profits tax was raised from 50% to 66⅔%, and the surcharge on the supertax was put up from 25%, at which it had been imposed in Nov. 1940, to 33⅓%. The general position was one of con-

tinued financial strength; the repatriation of India's sterling loans was approaching completion, enabling her to shed her status as a debtor country and reducing her foreign remittances; the rupee exchange remained stable, and the inflation which characterized World War I had been avoided.

In 1941 Lord Linlithgow's term of office was extended to April 1943, the end of its seventh year.

Domestic Problems.—By far the weightiest of India's problems—vastly more important than her political logomachies—is the possibility of improving, or even maintaining, the standard of life in a population which increased by 18% in the decade 1931–41. Much was expected from the fillip which the war gave to industry. It opened up new courses of manufacture and fields of productive power which ought to help in relieving the growing pressure on the land. Active steps were being taken in 1941 to consolidate advances in this respect by extensive measures for technical training, including the sending of groups of young Indian artisans to England for practical instruction. Meanwhile general administration proceeded smoothly, although communal riots were again in evidence, at Ahmadnagar, Bombay and Cawnpore. Four provinces, with a population of roughly 100,000,000, were still working the reformed constitution, with an Indian executive responsible to an elected legislature. In the other 11, with about 200,000,000 population, the whole system of parliamentary government remained in suspense at the ukase of the congress; but the official administration which temporarily replaced it seemed to cause no dissatisfaction among the people and was carried on, so far as possible, along the lines which the previous Indian minister had laid down. In Bombay the prohibition of foreign liquor was withdrawn. On May 25 Bengal was visited by a disastrous cyclone, in which more than 4,000 lives were lost. Funds were allotted for a broadcasting house in New Delhi, to be the headquarters of the All-India radio, and for foreign transmission; and a daily wireless service was started for the information of the forces in the middle east and for the dissemination of local news. (*See* also BURMA.) (ME.)

Education.—Recognized institutions in British India (excluding Burma): primary (males): schools, 159,280; scholars, 8,242,332; (females): schools, 28,482; scholars, 2,627,615; secondary (males): schools, 11,177; scholars, 2,169,272; (females): schools, 1,510; scholars, 235,756. Colleges (males): number, 327; scholars, 123,599; (females): number, 41; scholars, 8,970. Universities: British India, 15; native states, 3.

Finance.—Revenue, central government (est. 1941–42), rupees 1,58,89,38,000; expenditure, central government (est. 1941–42), Rs.1,58,89,38,000; public debt (March 31, 1940): in India, Rs.4,50,23,00,000; in England, £280,100,000; notes in circulation (June 30, 1941), Rs.2,76,93,00,000; reserve (June 30, 1941), Rs.2,91,10,00,000 (gold, Rs.44,42,00,000; silver rupee coins, Rs.36,57,00,000; sterling securities, Rs.1,18,80,00,000; rupee securities, Rs.91,31,00,000). Currency: 1 rupee (Rs.1)=1s. 6*d.* at par; exchange rate (average 1940), Rs.1=30.16 cents U.S.; (July 1941) Rs.1=30.13 cents U.S.

Trade and Communication.—Overseas trade 1940–41: imports, merchandise, Rs.1,56,79,39,567; exports, Indian merchandise, Rs.1,86,90,50,588; re-exports, merchandise, Rs.11,81,28,111; gold and silver coin and bullion (1938–39), imports, Rs.2,77,77,737; exports, Rs.14,09,08,106; imports of Afghan merchandise (1939–40), Rs.3,97,06,671; exports of Indian produce to Afghanistan (1939–40), Rs.72,79,399.

Indian Imports and Exports 1940-41

	Imports from Rs.	Exports to Rs.
U.K.	35,96,56,904	64,97,24,750
Burma	28,36,04,071	16,23,89,707
Japan	21,54,78,290	9,00,35,095
Germany	9,16,653	...
U.S.A	27,00,62,601	25,90,71,625

Roads (March 31, 1938): British India only, 83,612 mi. motorable roads, 201,701 unsurfaced. Railways (March 31, 1939): mileage open to traffic, 41,134, of which 29,744 mi. are government owned. Shipping: tonnage entered (monthly average 1939), 924,200; tonnage cleared (monthly average 1939), 917,500. Motor vehicles licensed (Jan. 1, 1939): British India, 97,717 cars and taxis; 38,681 commercial vehicles; 8,898 motorcycles. Wireless receiving set licences (Dec. 31, 1940); 100,388. Telephones (March 31, 1940): 86,219 straight-line connections, 626 exchanges.

Agriculture, Manufacturing and Mineral Production (1939–40).—Production (in metric tons): rice, 38,532,000; wheat, 10,094,400; cane sugar, raw, 2,770,000; maize (1937–38), 2,080,800; barley (1938–39), 2,119,500; jute (1939), 1,748,100; coal (1939) (British India), 2,504,400; iron ore (metal content) (1938), 1,790,000; pig iron and ferroalloys (1939), 1,785,000; steel (1939), 1,035,000; petroleum, crude (1939), 328,000; cotton, ginned, 907,200; groundnuts, 3,050,200; tobacco, 495,800; tea (1938), 205,000; manganese ore (metal content) (1938), 492,000; linseed, 452,200; gold (1939), 12,900 kg.; bauxite (1938), 15,000; chrome ore (chromic oxide content) (1938) 22,000; rape seed, 940,900; sesamum, 421,700. Industry (excluding Burma): cotton (1938–39) yarn spun, 1,303,245,902 lb.; woven goods, 920,475,805 lb.; number of mills, 389; average number employed, 441,949. Jute (1937–38): mills, 105; average number employed, 309,000. Total number of factories (1938), 9,743; average daily number employed (1938), 1,737,755.

Indiana. A north central state, Indiana was admitted into the union Dec. 11, 1816, the date observed as Indiana day. Indiana was the 19th state in order of admission. The popular name of the state and its inhabitants is "Hoosier"; the origin (in the 1830s) of the term is unknown. The total area of the state is 36,291 sq.mi., of which 86 sq.mi. exclusive of its Lake Michigan jurisdiction are water surface. The population of Indiana in 1940 was 3,427,796, of which 44·9% was rural and 55·1% urban. Indianapolis, the capital, had a population (1940) of 386,972. Other cities are Fort Wayne (118,410), Gary (111,719), South Bend (101,268), Evansville (97,062), Hammond (70,184), Terre Haute (62,693), East Chicago (54,637), Muncie (49,720), Anderson (41,572).

History.—The most significant political development of 1941 was the struggle between the Republican general assembly, in session from Jan. 9 to March 10, and Governor Henry F. Schricker, Democrat, for the control of the state government and the appointment of state officials and employees. The assembly repealed the executive-administrative act of 1933 which gave the governor complete appointive power and centralized authority in him in many other respects. It passed numerous bills over the governor's veto creating boards consisting of the governor and two (Republican) elected officials, and giving them appointive and administrative authority over the various institutions and administrative offices of the state. After the general assembly adjourned, Governor Schricker sought and obtained a judicial injunction against action by these boards. After considerable litigation the state supreme court handed down decisions June 26, 1941, which declared most of this legislation unconstitutional and reaffirmed the appointive power of the chief executive of the state. In the exercise of this power Governor Schricker gave consideration to recommendations of heads of state institutions and, in political appointments, to recommendations of the Democratic state committee—the system generally prevailing before the highly centralized autocratic system was set up in 1933. The state personnel act which became a law on March 8 without the governor's approval, established a merit system in the state institutions, the state board of health, the department of public welfare and some other agencies.

The political alignment of state officers during 1941 was anomalous and productive of some confusion. Governor Henry F. Schricker, who began a four-year term in January, is a Democrat; the four holdover members of the supreme court (including the chief justices Michael L. Fansler, May–Nov., and Curtis G. Shake, Nov.–May 1942) are also Democrats; a solitary Republican justice was elected in 1940. The appellate court entered the year 1941 with four Democratic and two Republican justices. All the other elected state officials and a majority of the senate and the house of representatives were Republican in 1941. Charles M. Dawson was lieutenant-governor and president of the senate; James M. Tucker, secretary of state; James M. Givens, treasurer; and Richard T. James, auditor.

Education.—In the school year 1940–41 there were 2,102 elementary schools, 674 combined elementary and high schools and 165 senior, junior-senior and junior high schools. The enrolment in elementary grades was 459,434, in secondary school grades 196,795. There were 11,844 teachers in elementary grades, 1,103 in junior high school grades, and 7,843 in

senior high schools.

Indiana university at Bloomington in 1940–41 had an enrolment of 6,759 and a faculty of 507; Purdue university (Lafayette) an enrolment of 7,435 and a faculty of 489. Indiana State Teachers college (Terre Haute) had an enrolment of 2,044 and a faculty of 113; Ball State Teachers college (Muncie) an enrolment of 1,898 and a faculty of 104.

Public Welfare and Charities.—The state maintained the following "benevolent" institutions in 1941: Central State hospital (Indianapolis), Evansville State hospital, Madison State hospital, Logansport State hospital and Richmond State hospital (the five hospitals for the insane), Fort Wayne State school for mentally deficient children, Southern Indiana Tuberculosis hospital (New Albany), the state sanatorium for tuberculosis (Rockville), Muscatatuck colony for the subnormal (Butlerville), Village for Epileptics (New Castle), Soldiers' home (Lafayette), Soldiers' and Sailors' Children's home (Knightstown), School for the Deaf, School for the Blind and School for Industrial Aid for the Blind (Indianapolis).

Payments for public welfare, general relief etc., were as follows for the year ending June 30, 1941: old-age assistance, $14,604,196.70; aid to dependent children $5,927,820.75; blind assistance $591,601; general relief $6,672,186; WPA $25,374,231; unemployment compensation $6,717,499.

The total population of Indiana's four correctional institutions on June 30, 1941, was 5,718; of its two training schools, 723. Expenditures on the six institutions for the year ended June 30, 1941, were $1,758,455.69.

Communication.—There were on June 30, 1941, approximately 10,155 mi. of roads in the state highway system and 70,113 mi. of county roads. Expenditures by the highway commission during the fiscal year ending June 30, 1941, totalled $28,069,431. The average mileage of steam railroads operated in Indiana in 1940 was 7,250. On June 30, 1941, there were 46 airports recognized by the U.S. department of commerce.

The Indiana Bell Telephone company on Dec. 18, 1941, reported 285,870 telephones in use (not including telephones of the Illinois company in northwestern Indiana, nor those of the Ohio company in southeastern Indiana). Independent companies on Dec. 30, 1940, reported 265,826 telephones.

Banking and Finance.—On June 30, 1941, there were 382 state and 124 national banks in Indiana. The total capital of state banks was $59,517,849; deposits amounted to $504,974,209; the national banks had a total capital of $51,840,441 and deposits of $592,845,963.

The 186 state-chartered building and loan associations had assets of $86,282,894 as of Dec. 31, 1940; the 69 federal savings and loan associations had assets of $97,394,000.

Total receipts of the state treasury during the year July 1, 1940–June 30, 1941, were $147,043,855; disbursements were $143,175,941. The state, as such, had no debt, the constitution forbidding the incurring of indebtedness except for certain strictly limited emergencies.

Agriculture.—The total value of agricultural production in 1939 was $180,188,000; the total acreage reported was 9,845,800. Cash income from crops was $64,155,000, from livestock and livestock products $189,163,000, from government payments $20,885,000.

Table I.—*Leading Agricultural Products of Indiana, 1940 and 1939*

Crop	1940	1939	Crop	1940	1939
Corn, bu.	145,669,000	213,416,000	White potatoes, bu.	4,335,000	4,500,000
Wheat, bu.	30,147,000	27,612,000	Apples, bu.	1,225,000	2,075,000
Oats, bu.	49,950,000	25,225,000	All tame hay, tons	2,828,000	2,716,000
Soybeans (for grain), bu.	10,989,000	14,430,000	Peppermint (oil), lbs.	372,000	269,000
Rye, bu.	1,785,000	1,608,000	Tomatoes (for market), lbs.	540,000	567,000
Barley, bu.	1,450,000	903,000	Tomatoes (for manufacturing), tons	363,000	361,500

Manufacturing.—The biennial census for 1937 showed 313,342 wage earners (average for the year), $402,116,998 paid in wages, and $2,497,547,946 as the value of the products.

Table II.—*Principal Industries of Indiana, 1937*

Industry	Value of Products, 1937	Industry	Value of Products, 1937
Steel works and rolling-mill products	$356,646,436	Meat packing, wholesale	$79,885,003
Petroleum refining	190,332,763	Machine shop products	62,678,053
Motor vehicles (not including motorcycles)	188,593,660	Refrigerators, etc.	58,013,662
Motor vehicle bodies and parts	131,260,240	Glass	57,004,049
Electrical machinery, apparatus and supplies	113,230,341	Railroad cars	56,129,931
		Canning food	45,006,000

Mineral Production.—The total value of mineral production in Indiana in 1939 was $53,423,223. In the year 1940 there were 248 new oil wells and 77 gas wells completed. Total production of petroleum in 1940 was estimated at 5,290,608 barrels.

Table III.—*Principal Mineral Products of Indiana, 1939 and 1938*

Mineral	Value 1939	Value 1938
Clay	$ 5,629,014	$ 4,088,658
Coal	24,642,000	23,968,000
Petroleum	1,675,000	1,260,000
Sand and Gravel	3,388,207	2,958,473
Stone	7,460,650	6,486,996

(C. B. C.)

Indians, American. President Roosevelt, on Nov. 1, 1941, signed an order establishing a National Indian institute in the department of the interior to collaborate with the Inter-American Indian institute provided for in the convention of the First Inter-American conference on Indian affairs held at Patzcuaro, Mexico, in April 1940. This convention came into force with its ratification by a fifth nation, Ecuador, in October. Previous ratifications were by Mexico, Honduras, El Salvador and the United States. The National institute in the United States (of America) will also initiate and promote collaboration in the fields of Indian administration and a study of Indians among federal, state and private agencies, in the U.S. and abroad. John Collier was appointed director.

The economic rehabilitation of a group of 300 Catawba Indians remaining in York county, S.C., was being jointly undertaken by the state and federal governments. The Farm Security administration was furnishing agricultural loans and expert guidance. The Indian service was advising and assisting in the fields of health, education and craft revival. There will be no reservation, and the Catawba Indians will become neither federal nor state wards, but will be voting and tax-paying citizens of the state. While a relatively minor group, the handling of the Catawba problem may indicate a new relationship between the government and Indian tribes not already under wardship.

Folk Arts.—Early in 1941, the folk arts of the American Indian received high recognition in a special showing at the Museum of Modern Art in New York city, where North American Indian arts over a span of more than 10,000 years were given an unusually handsome display. In June, The Museum of the Plains Indian was opened at Browning, Mont., on the Blackfeet reservation, as a continuing display of Plains Indian history and culture and a centre for the commercial distribution of modern Plains Indian crafts.

Selective Service.—Representatives of the Six Nations in New York state and the Yakima in Washington state appeared in court to protest the drafting of their young men for military service. They argued that it violated their status as members of independent nations who had never accepted United States citizenship. As both groups have always furnished volunteers in large numbers to the armed forces of the United States, this was not an objection to military service with the United States. The court rejected their contentions, ruling that congress had already determined that all Indians born in the United States are citizens.

Walapai Suit.—The suit of the Walapai Indians to enjoin the Santa Fe railroad from interfering with the possession and occupancy of lands in northwestern Arizona, claimed by the railroad under a land grant from the federal government, on the ground that these lands were subject to the Indians' right of aboriginal occupancy, was decided by the supreme court on Dec. 8, 1941. The supreme court held:

1. That the aboriginal occupancy rights of Indians to lands formerly under Spanish dominion are protected in the same way as Indian lands in other areas, even against those holding title to public lands.
2. That the existence of aboriginal occupancy rights does not depend upon formal recognition by the government.
3. That forcible removal of Indians from their ancestral homes does not terminate their possessory rights in lands which the tribal group has occupied from time immemorial.

The suit in question related to the lands both within the reservation and to those formerly occupied by the Indians outside the reservation. The court held that the Walapai tribe was entitled to an accounting by the railroad respecting the lands on the reservation which can be proved to have been occupied by the Indians from time immemorial. The court held, however, that in accepting its present reservation the tribe voluntarily agreed to the extinguishment of its aboriginal tribal rights elsewhere. This decision may be of great significance as establishing policy relat-

ing to Indian land titles in areas formerly under Spanish sovereignty. (W. W. B.)

Indo-China, French: *see* CHINESE-JAPANESE WAR; FRANCE; FRENCH COLONIAL EMPIRE; JAPAN; THAILAND; WORLD WAR II.

Industrial Hygiene. Speeding up of industry threw new responsibility on physicians in 1941. The Division of Medical Sciences in the National Research council; the industrial medicine committee of the health and medical committee of the Office of Defense, Health and Welfare; the Office of Scientific Research and Development in the Office of Emergency Management were especially concerned with these problems. The Council on Industrial Health of the American Medical association also co-operated, as did special organizations of industrial physicians.

Personnel.—A questionnaire circulated by the American Medical association showed some 10,000 doctors in the United States giving special attention to industrial medicine. About 1,500 were giving full time to industrial medicine. In Great Britain, regulation demanded that every industry employing more than 300 men have full-time industrial medical service. Smaller plants may use part-time services.

Industrial Dermatoses.—Especially prominent are the inflammations of the skin associated with the use of various chemicals in industry. Coal-tar derivatives head the list, but there are skin disturbances associated with flour, lily bulbs, acids, alkalies and hundreds of other substances. A special division of the National Institute of Health in the United States Public Health service led in studies in 1941. Use of gloves, protective ointments and other sanitary arrangements help to minimize the hazards. (*See* also DERMATOLOGY.)

War Industries.—Special attention to hours of work, speed-up, fatigue and accidents are particularly problems of industries associated with war. Studies of 1941 indicated that rest is more important in overcoming fatigue than is doping with benzedrine, or taking large amounts of mixtures of vitamins.

Aviation medicine was the basis of many studies related particularly to lack of oxygen in high altitudes with the appearance of air bubbles in the circulating blood. Also important was the development of clothing to keep aviators warm at high altitudes.

Fliers and drivers of tanks were reported in 1941 to be suffering increasingly from slipped disc or extrusion of the nucleus pulposus in the spine. This produces constant pain and represents pinching of the soft cartilages between the bones of the spine.

Special problems were created by the increasing employment of women in industry associated with the war effort. Absenteeism among women workers is invariably greater than among men doing similar work.

Studies continued on silicosis (*q.v.*), inflammations of eyes of arc welders, blood degenerations associated with work among benzene derivatives. The nutrition of the workers, housing and recreation were given continuous consideration.

Voluntary hospitalization insurance during 1941 covered almost 12,000,000 workers. The government considered expansion of the social security act to provide compensation to cover hospitalization costs for disability sustained in industry. (*See* also MEDICINE.) (M. FI.)

Industrial Production: *see* BUSINESS REVIEW.

Industrial Research. The industrial research of the United States is contrived to contribute to national welfare. And in all this work the progress was great, especially from the standpoint of equipment and supplies dependent upon metals, rubber, synthetic resins, textile fibres, foods, chemicals and petroleum. In the major branches of manufacture there was intense activity; in some fields there was the necessity for secrecy. The total expenditure for basic production research in the United States in 1941 was about $275,000,000.

The widening of the scope of Air Hygiene foundation at Mellon institute led to its new name, Industrial Hygiene foundation. The budget for industrial hygiene in the National Institute of Health is close to $500,000. In general the U.S. was well prepared to cope with health problems in war industries. The U.S. bureau of mines reported on low-grade coal utilization, alunite resources, limestone and dolomite, gypsum, Iceland spar and optical fluorite, froth flotation and agglomerate tabling of micas, treatment of Alabama graphite ores, and concentration of low-grade manganese ores. TVA was experimenting with clay as a source of alumina; similar investigation was being conducted at Columbia university. Research was going forward on the use of vermiculite for lightweight concrete. The national bureau of standards reported research on action of frost on bricks, cause and correction of leaky masonry walls, and moisture-condensation in building walls. Several companies were making spark plugs by using ceramic cores containing no mica. The production of glazed porcelain cooking ware was under study. By a new procedure the components of a vitric batch were precipitated together. Ammonia, electrolytically introduced into soda glasses, was easily removable, leaving a product of higher silica content. There was announced an optical glass made of tantalum, tungsten and lanthanum, possessing greater light-bending power than ordinary glass. Glass fibre was being applied in the hull insulation of battleships, in insulating oil tanks in bombers, and in sound-deadening in plant construction.

The national bureau of standards released the findings of exhaustive tests to determine the corrosion behaviour of metals in soils. Powder metallurgical processes lent themselves well to the production of alloys. New methods of ferrous dephosphorization were being applied; external desulphurization of pig iron attracted attention. A possible substitute for steel to resist deformation at 1,100° F. was iron containing molybdenum or columbium. Continuous casting of steel increased; open-hearth operation was better controlled than formerly. A process for making light armour plate speedily enabled the carrying out of three heats in 24 hours; the carburizing treatment was accomplished with a liquid salt bath in an electric furnace. A $2,000,000 research program resulted in the development of Hipersil, an improved magnetic material for transformer cores. Molybdenum was substituted in part for tungsten. Straight chromium steels have a tendency toward temper embrittlement that can be eliminated by addition of molybdenum. Bismuth in small amount benefits the machinability of stainless steel. High-frequency induction heating was said to be satisfactory for localized surface hardening of crankshafts and a wide variety of machine parts. Research was intensified on the application of phosphoric acid or phosphate treatment to rolled steel strip for use in cans to evolve a process to make the employment of tin unnecessary. To combat static electricity, copper powder was being put in flooring cements and rubber belting. A number of companies sought new industrial uses for silver. Some of their suggestions: substituting silver for copper in electrical contacts and using silver with magnesium for lightweight alloys. The National Academy of Sciences proposed that silver be put to work for tin in solder. Work progressed on aluminum welding processes. It was predicted aluminum might later be used extensively

in photographic and motion-picture films. The automobile industry planned to jump into the employment of aluminum in a big way after the emergency terminated. Innumerable explosive rivets of anodized aluminum alloy were used in aircraft construction. Heat applied to the rivet head by an electric gun detonates the explosive in a cavity at the end of the shank, expanding the latter and forming a blind head in setting the rivet. Sea water was used as the source of magnesium in plants in Louisiana and Texas. Several new processes for producing magnesium were described.

The completion of many waste-treatment plants indicated the general progress toward cleaner streams and less health hazards; tendencies were toward more mechanization and broader use of physical methods. By-product utilization was taken up aggressively. The reactions of metal oxides with sodium chloride, sulphur dioxide, air and steam were suggested as possible outlets for large quantities of sulphur dioxide that may be recovered from waste gases. Fog over aerodromes could be dispersed with sulphur chloride solutions. Companies near San Francisco produced from sea water magnesium oxide for fertilizers. Many unusual phosphorus compounds were ready for application. Zinc oxide was proposed as a heat-insulating material. Many organic reactions that, by older methods, required high temperatures or pressures were carried through at ordinary temperatures and pressures by electrolysis. There was being studied the effect of metallic halides on the reaction of Grignard reagents and organic molecules containing functional groups. A procedure was developed for condensing alkyl carbonates with organic esters by metal alcoholates for the convenient production of malonic esters. The use of a third component to improve the fractional distillation of binary liquid mixtures attracted interest. Resinous products derived from substituted silicon compounds were described. Synthetic glycerol brought a number of intermediates from the process formerly obtainable in quantity only from glycerol itself. Many amines were finding uses in the production of dyestuffs. Sixteen new propionates of sugars were synthesized. Synthesis of phenol by a method involving the partial-pressure evaporation of water of reaction as formed was said to offer advantages over customary processes.

A division of chemotherapy was at work in the National Institute of Health. Solutions of sulphanilamide and related sulpha drugs appeared to act like colchicine in speeding up evolutionary changes in plants; colchicine was used in producing apparently similar changes in animals. The text of the 12th revision of the *United States Pharmacopoeia* was expected to become official about Aug. 1, 1942. To a greater extent than ever before pharmacopoeial recognition was being given to organic synthetics in the field of medicine.

Photosynthesis was further elucidated by tracer studies; some phases of the process may be independent of light. All four regional laboratories of the U.S. department of agriculture were occupied; more than 400 persons were at work in them. Disease-resistant vegetables for the home garden were described. More than one-fourth of the nitrogen used in mixed fertilizers is supplied by ammonia liquors. Waste sulphite liquor was shown to confer sulphur to soils lacking in that element. The use of chemical fertilizers dissolved in water as a starter solution and for liquid side-dressing of vegetable crops was the subject of much research. Fertilizers in the form of pellets and cubes were said to have advantages. Rooting of numerous varieties of citrus cuttings was favoured by immersing them in 0.02% heteroauxin or 3-indole-acetic acid solution; this chemical also increased cotton yields. 3-indole-butyric acid was being employed as a growth promoter by pecan husbandmen. A process of hulling cotton-seed by steam explosion was under development. Cotton insulation for dwellings was considered a promising use. Insulating board was made experimentally from cotton burrs and stalks and gypsum. Cotton Research foundation fostered at Mellon institute investigations on cotton plant constituents and on properties of cotton fibres. Two new varieties of soybeans were being studied by the New Jersey experiment station. Researches in refining soybean oil and in using it in combination with other oils increased its consumption. The introduction of wet toasting following extraction, to increase the palatability of soybean meal, helped to abate the prejudice against the use of the solvent-processed product in feeds.

Improvements were made in infant feeding and the nourishment of 20,000,000 school children. With less than 2,000,000 babies born a year, infant-food manufacturers expanded their markets with lines of products for older children. The next step might be foods especially for the middle-aged and aged, an advance that might be nurtured by the growth of interest in geriatrics. Fresh results of nutritional research suggested better types of rations to prevent avitaminoses and to promote efficiency of fighting personnel. Emergency need for concentrated foodstuffs was speeding research by the U.S. department of agriculture on the dehydration of vegetables, and the program might be extended to include other foods. Progress in the dehydration of foods was likely to effect marked improvements in quality as well as vitamin contents of such products. A frozen-food research laboratory was completed by the federal government at Albany, Calif. About 50 industrial research laboratories were engaged in vitamin studies. Increases in the vitamin contents of certain useful plants were to be expected from genetic studies. It was estimated that $300,000 went into the production of the first gram of vitamin B_1 by synthesis. Efforts were being made to process vegetables in whole form and to conserve colour and flavour. The flash process was adapted for use on tomato juice. Trends in milling technology continued toward improvement of the baking quality and nutritive value of cereal products. The production of enriched bread included the use of thiaminized flour or yeast, of vitamins and suitable iron salts for direct addition to the dough, and combinations of these procedures. A company began the production of flour by a process utilizing flotation to retain more minerals, proteins and vitamin B_1. Sugar was finding new industrial applications, such as in the preparation of chemicals, and in various other ways—for example, in steel-products technology to prevent splashed metal from solidifying on the walls of moulds during pouring. A larger yield of flavour was secured from spices by an explosion process. In studies by the U.S. department of agriculture, specialists found wide differences in the protection afforded by various types of paperboard packages and the linings and wrappings used with them. The addition of urea to the basal ration of cows definitely increased milk production. Of late years research has made cheese manufacturing less erratic, but it is still an art that sometimes breaks down. At Cornell there was evolved a low-cost process for smoking poultry, available for general use. An "ice box in reverse" that ages hams in 10 to 12 weeks, instead of the year or more required by the old-time farm method, was developed. The army quartermaster corps found beneficial the gelatin coating of meats.

By examining gases removed from samples of soils, to detect hydrocarbons present, it was possible to locate underground deposits of oil and gas. The practicability of recovering methane from coal *in situ* before mining was studied. Studies in the correlation of crude oils with geological environment yielded a method for distinguishing between crudes produced from the same horizon and regarded as practically identical by true boiling-point distillation. Horizontal drilling of oil wells, after 25 years of working out the problems involved, appeared to be an accomplished technique of the petroleum industry, bringing more oil production from certain types of fields and offering promise of further extension in the future. Brine properly conditioned was effective as a flooding medium for secondary recovery of oil. Further research progress was recorded on petroleum refining by-products as potential sources of pharmaceutical intermediates. The largest volume of octane was made by the alkylation process, the second largest by iso-octane, and the third by neo-hexane. The "fluid catalyst" petroleum cracking process was said to permit more continuous cracking and lower costs than intermittent cracking using solid catalysts. Compounds such as di-isopropyl formal blended with aviation fuels were claimed to aid vaporization in high altitudes. Improved protective coating for interiors of aviation fuel drums were devised. Lubricating oils of superior load-carrying capacity and decreased tendency toward oxidation and carbon formation were made by incorporating small amounts of the dialkyl esters of phthalic acid. Novel oils, creations of organic chemistry, were watch and precision-instrument lubricants. In diesel fuels a problem is to improve ignition quality, a property measured by its cetane number; certain addition agents, such as organic polysulphides, raised this number. A process for the fractional fusion of waxes was announced.

A process sped up the ageing of hardwood by injecting synthetic resin into green wood, at the same time removing the sap and moisture. The chemicals that demonstrated most promise in the seasoning of wood were urea, invert sugar and a mixture of them. To help aircraft builders the U.S. department of agriculture sought better inspection methods for the selection of wood. With the development of improved plywood resulting from the use of plastics, especially phenolic and urea resins, the growth in specialty applications, such as furniture, housing, radios, shipbuilding and aircraft, was large. A continuous process for the hydrolysis of wood with dilute acid was developed, resulting in the production of lignin and lignocellulose for plastics, as well as acetic and formic acids, furfural and wood sugars. The use of crude lignin powder for the removal of iron from water showed likely results. Lignin paste appeared satisfactory for bonding floor coverings. There was an increasing tendency to study from the point of view of chemical kinetics the reactions involved in wood pulping. A penetration and acid-recovery process for sulphite mills employed the principle of interconnected digesters which form a closed system. In pulping conifers a small but definite amount of sodium sulphide was necessary to obtain optimum pulp properties. Another substitute for salt cake consisted of gypsum and soda ash.

Electrically heated flying suits were perfected. Research on acroplane seats and cushions was in progress. Cotton had in 1941 over 1,000 known applications. The Cotton Board of Manchester, Eng., was assisting in arrangements with the National Association of Hosiery Manufacturers and other groups to make available the experience of British cotton spinners in producing hosiery of fine-gauge lisle yarns. Resist cotton yarns, called "immunized," were intended to produce decorative effects in fabrics. In new-use investigation excellent progress was made by the Cotton Research foundation toward the objective to effect, by inexpensive means, a marked increase in the drape qualities of cotton fabrics. Increased wear performance of fabrics was attained through selected weaving conditions. Special fabrics were developed for accomplishing better adhesion where employed in making laminated materials. Investigations were being conducted on the production and use of worsted-type yarns from rayon staple fibre and rayon blended with wool and other fibres. Bromination might have value in shrink-proofing wool. There was announced a further 25% expansion of the nylon yarn capacity. Considerable developmental work was in progress on applications of vinyon. Vinyon net came into use for women's shoe uppers; vinyon gloves were also introduced to American women. Vinyon felts were utilized by the shoe and luggage trade as liners and plumpers; they were also employed as filtering media in air-conditioning

and cleaning units and as anti-abrasive elements on the bottoms of lamps and table and desk ornaments. The use of toxic mercurial compounds in fur-carroting operations was largely eliminated from the hat industry. The Bealmac process became prominent in nonmercurial carroting. It was reported that 1,000,000 lb. of casein fibre would be in felt hats during the year. The array of American dyes included approximately 2,000 trade colours; the production in 1941 was valued at nearly $110,000,000 or about 45% more than in 1940. Cationic finishing agents and their effects on direct dyestuffs continued to receive research. Vinylite copolymer, high molecular weight resins were applied extensively in cloth coatings. Light coatings on fabrics were developed for shower curtains; heavier coatings found their way into raincoats and other waterproof apparel. Combined with cloth, vinylite sheeting, which is scuff-resistant, was utilized in children's shoes.

Exhaustive tests conducted by the national bureau of standards brought out that dwelling houses are kept cooler in summer if the exteriors are treated with white or light-coloured paints. The bureau of standards studied the behaviour of the special paints used on exterior walls of porous masonry to keep out moisture. Tung oil might be replaced by oiticica oil from Brazil, dehydrated castor oil, glycerides of fractionally distilled fat acids (from fish oil) and segregated oils (natural oils from which the non-drying constituents have been partly removed). Because of its low cost and similarity to tung oil, oiticica oil should be used increasingly by the paint industry in coming years. Zinc rather than lead driers should be employed with oiticica oil. The Flax institute endeavoured to produce a seed that would afford linseed oil of higher iodine value. The U.S. department of agriculture separated soybean oil into two fractions, one having much higher oil-drying power than the other. There was reported the limited commercial production of the pentaerythritol ester of fractionated soybean fatty acids, said to be superior to linseed oil in colour retention and drying speed. Special aircraft paints included a dull black hard to find with searchlights, a bright aluminum paint for sunny days and a paint for hiding planes on hazy days. The American Gum Importers association was sustaining research on natural resins. Congo and Manila resins possessed possibilities through esterification. Cyclic ketones, derivatives of isophorone of high molecular weight, were being used as plasticizers for coatings. Coatings of vinylite on steel replaced corrosion-resistant metals for many purposes, such as in refrigerator trays and washing-machine parts.

The United States and Mexican departments of agriculture concluded an agreement for rubber-producing experiments in Mexico. The governments of the United States and Haiti announced agreement on a program whose central feature was a plan of rubber development. The rubber-plantation industry in the western hemisphere was on the way to progress. Rubber processing might profit by utilizing methods of injection moulding developed by the plastics industry. Pellet rubber was said to facilitate mixing. A product that practically prevents cracking of tread and sidewall rubber was developed. Plioform was being utilized in fuel tanks of aeroplanes and combat vehicles; pliofilm gas-decontamination suits and baby parachutes for naval aircraft flares were available. The first of a series of full-scale Raolin chlorinated rubber manufacturing units was placed in operation. Up to 1941, 29 varieties of synthetic rubber had been studied. Current synthetic production of general purpose rubber was equivalent to about 3% of the crude rubber consumption; the output in 1942 should be at least 15% of normal requirements. In 1941 the automobile and aircraft industries used well over 100 different neoprene parts. In its resistance to ageing, ameripol was described as superior to natural rubber; its resistance to acids and alkalies is about the same. Ameripol sponge was in production.

More than 125,000 tons of plastics for moulding purposes were produced in the United States in 1941. At least 13 types of plastics were on the market. To cite some examples of plastics in war work, shock-resistant compounds found outlets in instrument cases for aircraft, fuse timers, electrical fittings and gun stocks; laminated and plywood products were of high importance to construction methods both in aeroplanes and in the new motor torpedo boats. The trend in the use of plastics has been toward industrial applications rather than for ornamental purposes. For instance, comprehensive researches led to the development of new synthetic resin exchange adsorbents and a purifying agent in the sugar industry consisted of an active resin deposited upon a diatomaceous base. Extruded plastics were available in more than 60 shapes. Commercial articles manufactured by injection-moulding machines varied from a tiny doll's eye to windows for the housing of roadside gasoline pumps. A method for thermosetting resins, known as transfer moulding, was extending the design of pieces made from phenolic and urea moulding powders.

Cellulose nitrate, the old timer of thermoplastics, found important usage in the automotive industry. Hammers with heads of pyralin cellulose nitrate were employed extensively. Tenite cellulose acetate was seen in window shades on buses, in tops of syrup pitchers, in fishnet floats, in the casings of leash reels, in tool and revolver handles, in oil cups and in graduates and funnels in laboratories. Extruded mouldings of tenite were being made in a variety of shapes, sizes and colours. Ocarinas, radio dials, lenses and knobs, "juke box" coverings and piano music racks were applications of plastacele. Bakelite had more than 15,000 patented uses. The production of cast phenolic resins approached 6,000,000 lb.; the principal applications included phonograph decorations, jewellery and dress ornaments, brush backs and radio cabinets. Continuous tubes and shapes were supplied in lustron polystyrene. The position of elastomeric compounds in the field of plastics became increasingly important. Umbrellas, watch chains and cosmetic, shoe, garment and laundry bags were being made of vinyl elastomers. Vinylite compounds in tape form were developed for providing electrical and protective insulation on many types of circuits. Koroseal was available in monostrands and also in film and tubing. Polyvinyl alcohol was well known in the form of flexible refrigerant hose. A glare-eliminating screen for automobiles, claimed to be 99.99% efficient, used polyvinyl alcohol, stretched, then treated with iodine. Saran fabric, woven like cloth, was under development as an upholstery material. A foamed urea plastic appeared to be an insulator for heat and sound. Both hot- and cold-setting plaskon glues were in use in aeroplane construction. A new method was announced for applying resin surfaces to dense materials such as laminates.

The acrylic gun turret was an improvement over the "blisters" formerly used on bombers; the acrylic navigator's hatch was also another development. A transparent, shatter-proof acrylic plastic was utilized in planes for windows, noses, tail empennages and landing light covers. A transparent plexiglas pump for handling dilute acids, hypochlorites and other chemicals was being marketed. A conveyor apron made of lucite methyl methacrylate resin rods was an innovation on textile-conditioning machines. The capacity for the manufacture of transparent lucite sheeting was doubled. Seventy applications on 14 models of 1942 automobiles attested to the use of lucite in this field; two 1942 models each had 11 parts of lucite.

Canada.—The staff of the National Research council's laboratories at Ottawa had been almost doubled since 1939. The funds at the disposal of the council for 1941 were some fivefold greater than for the last prewar year. In addition, other projects involved about twice or three times as much again and a trust fund provided by the industries of well over $1,000,000 was available if needed. Research Enterprises, Ltd., was a wholly owned government corporation established by the ministry of supply to produce for the armed forces and for the industries devices developed by the council. Aeronautical laboratories were constructed; about 1,000 laboratories were being maintained by industrial establishments; close to 225 laboratories were in operation in universities. A wartime bureau of technical personnel in the department of labour recruited competent persons for scientific work in the war industries. War minerals were being sought widely, and numerous discoveries were made. Twenty-five plants were making heavy chemicals and the production of synthetic ammonia was started in the first of three new factories. Aviation gasoline of octane value 80–87 came from the crude oil of Turner valley; a plan was under consideration to produce motor fuels from a combination of ordinary gasoline and wheat-derived alcohol. Improvement in the flavour quality of Wiltshire bacon resulted from the adoption of better handling and curing practices. The Fisheries Research board issued a comprehensive bulletin on the chemistry and technology of marine animal oils.

Brazil.—The government, considering the country's great mineral resources and the need for the development of heavy industries, established the National Council of Mines and Metallurgy. The production of sulphur from pyrite and the potassium salts and about 20 other chemicals was being studied. The Instituto de Pesquizas Tecnologicas was in charge of the treatment of lead and silver ores. The production of medicinal preparations was increased. A national pine institute was operating. A study of technical methods used in processing vegetal materials was undertaken for Brazil by the U.S. department of agriculture. Brazil had about 20 varieties of vegetable oils. A division on rubber was formed in the Instituto Naçional de Tecnologia. Rubber plantations were receiving favourable reports from the experimental stations. Brazil would be an important source of natural caffein if the plastic caffelite were manufactured on a large scale, as contemplated.

Great Britain.—Scientific research in Britain's war effort had three main pillars: the Department of Scientific and Industrial Research, the Medical Research council and the Agricultural Research council. Some 20 fields were given associative investigation under the auspices of the department. Two research associations had annual expenditures of £100,000. An Engineering Advisory committee was appointed to assist in solving engineering problems connected with the war. The British Standards institution issued emergency specifications to meet conditions from restrictions in the supply of materials and also advice on fire-detection devices for combating incendiary bombs. The Gas Research board was formed. The chemical industry continued to meet essential requirements, but a number of important materials must be imported, including pyrite, phosphates and potash. A Chemical Control board was engaged in co-ordinating the work of the various raw material controls. The proposal was made that coal seams of low range be exploited by underground gasification, as in the U.S.S.R. Research was published on the constitution of alloys of aluminum with magnesium and silicon. A method of magnesium recovery was based on the use of a high-frequency induction furnace and a solid reducing agent, such as ferrosilicon or calcium carbide. The Chemical society introduced a scheme to facilitate the supply of fine chemicals. The Imperial institute published a survey of wartime drug supplies and empire production. To hasten the application of promising research results to farming practice was the task set the Agricultural Improvement council. Ammonium bicarbonate was a wartime alternative to ammonium sulphate as a fertilizer. Research was undertaken on the effect of low temperatures in preventing damage to wheat stored with high moisture content. The ministry of food advocated the use of sodium bicarbonate for cooking fruit to reduce sugar consumption. The cheese-making industry was to be cultivated by the application of rheological methods. Chloral hydrate was found to be useful in restoring documents "knocked out" by fire. A synthetic tannin was obtained by fusing phenol with alkali and sulphur. Mercerizing of cotton was claimed to be improved by replacing caustic alkali with silicate of soda. Rayolanda X was obtained by introducing a synthetic resin into the viscose spinning mass. The dyeing and processing of blackout curtains continued to win attention. Rubber armour was found to protect persons exposed to air raids by taking up and dispersing the pressure wave. Isobutylene highly polymerized resembles natural crepe rubber, but deteriorates less on ageing. It was expected the supplemental development of synthetic rubber would have a stimulating effect on the processing of natural rubber. British plywood manufacturers set up a division for the production of major components and stressed parts of aeroplanes. Wood impregnated with plastic material was used for the construction of aeroplane stamping dies. In aircraft, plastics were employed for under-carriage, hydraulic ram and pump, and power-operated gun-turret bearings. In World War II, camouflagists became aware of the importance of the principles of countershading and dazzle.

Netherlands.—The Cuma water-treating system consisted of weak solutions of silver produced by electricity. Sulphur dioxide was used to control rinder scab of cattle. All yeasts investigated at Amsterdam were found to contain free aneurin.

France.—It was urged that automotive producer gas be made from coal concentrated by flotation so as to ensure the highest quality motor fuel of this type. Early in the year papers appeared on the basic Martin process

and on the properties and uses of rare-earth metals and their compounds. Researches were published on the synthesis of diacetone alcohol, on the ethers and esters of glycol and glycolic aldehyde, on the condensation of phenylacetic and phenylformylacetic esters, and on the nitration of cellulose. France was making plans for cellulose manufacture from straw.

Italy.—A method of coating small objects by copper carbonyl was described. Research was active in the production of pure zinc and zinc alloys. Although Italy possesses considerable bauxite the country conducted extensive experiments on the employment of leucite as an aluminum raw material. The utilization of alunite also was considered. Experiments were carried out with coal gas as a fuel for aeroplanes. The cultivation of the castor plant was encouraged; castor oil was under trial in aeroplane lubricants. An experimental station conducted research toward utilizing native essential oil plants.

Switzerland.—The leading task of the War Industries and Labor office was to safeguard the raw materials supply and industrial production. The number of persons employed in the chemical industry nearly trebled since 1890. The Society of Chemical Industry in Basle attributed its success under war conditions to a policy of decentralization. The first of three new staple-fibre plants began operation. At Geneva the molecular weight and constitution of caoutchouc were studied. Research reports were published on amidon, steroids, vitamin F and the enzymatic oxidation of carotin.

Hungary.—Bentonitelike clays were used for laundering and in the place of cutting oils in the metal-working industry. Safflower oil was available for producing soaps, varnishes and margarine. Condensation products of aromatic amines and aliphatic aldehydes were used in making resin preparations. Investigation demonstrated that keratin could be transformed into various coloured azo dyes.

Germany.—Since 1938 the reich succeeded in trebling synthetic oil output; this product costs two to three times as much as natural petroleum. An improved motor fuel was obtained by heating benzene in an autoclave to 225° C. under a pressure of 20–25 atmospheres for several hours. More than 1,000,000 cu.m. of wood was distributed for motor fuel during 1941. A research institute was formed to work out improvements in safety glass and glass fibre manufacturing processes. The properties of cerium-treated cast iron were studied. Many steel alloys were developed especially for castings. Manganese steels were substituted for chromium-molybdenum aeroplane structural steels. Inkromizing was effected by the chrom-diffusion of steel with chromic chloride. If plans were carried out, aluminum eventually would largely replace tin in the production of containers. Increasing employment of magnesium alloys in machine parts, railway and automotive vehicles, and aircraft made strength a vital problem. It was known that large quantities of war gases were ready. New techniques would enable gas attacks on a wider scale than any seen in World War I; for instance, fleets of aeroplanes equipped with chemical tanks could spray large areas with vesicant liquids. That gas attack was regarded as possible at any time was evidenced by the fact that all the belligerent nations had equipped their armies with masks. A new establishment was concerned with vitamin testing and research. Research was reported to have been successful in improving tobacco types. Mineral acids served to preserve green fodder if a neutral protective agent were interlayered. An institute was founded to furnish information on various woods. Wooden "hardware" for doors, windows and furniture appeared on the market. Scientists were at work to achieve satisfactory substitutes for cork. The preparation of cellulose from corn stalks was said to be much easier than from wood sources. Potato tops were being pressed into briquettes for use by paper factories. Research was conducted on the use of flax and hemp wastes for making staple rayon, the manufacture of cellulose from lignite, the use of chestnut wood, willow bark, hops and bean stalks as cellulose raw material, the preparation of keratin from wool dust, human hair and natural silk waste, the making of textile fibres from tendons and horse meat, and the production of fishskin leather. The cost of producing synthetic rubber was about 40 cents per lb. Hard Buna was claimed equal to hard rubber products in chemical and mechanical durability and superior in heat resistance. Uses of plastics in aviation were made in laminated bullet-resisting windshields, transparent cockpit covers and instrument panels. Alkyd resins were being more and more used in the painting of iron. It was found that an aluminum-silicon alloy occasionally substitutes for lead pigments. Zinc ferrite was the rust-proofing ingredient of a new paint. Iron was rust-inhibited by paint containing carbon and ammonia.

Denmark.—The formation of metal ammines was investigated fundamentally. Substitutes for imported oilseeds were sought. The pharmaceutical industry was specializing in biological preparations.

Norway.—Labradorite was found utilizable for producing aluminum. Norway was said to be in a position to produce annually around 100,000 tons of cellulose fodder. A factory for the manufacture of pressed fish had a process claimed to preserve the product for 10 years regardless of climatic conditions.

Sweden.—A cement and concrete research institute was established. New types of alloyed constructional steel having either very little or no nickel content were developed. Experiments were made to extract vanadium and also alumina and potash from spent oil shale. A plant was planned for the production of alumina from andalusite. Experiments revealed improved methods of producing pine tar. Domestic apatite was serving as a substitute for phosphate rock. Whey was being converted into a substitute for molasses in cattle feed and confectionery. The Swedish State Research Insitute for Freshwater Fisheries investigated catch methods and the prevention of stream pollution and piscatorial diseases.

Finland.—Water-gas production, with wood or peat as fuel, was discussed as a source of power which would also permit the domestic manufacture of methyl compounds. The large-scale manufacture of sugar from wood was undertaken.

U.S.S.R.—The application of low temperatures in industrial research was important. A new process of making liquid air was developed. A compound of xenon with phenol was announced and it was said that krypton acted similarly. Research was done on semiconductors, rectifiers and photoelectric cells. The Academy of Sciences decided to construct a powerful cyclotron at a cost of 1,500,000 roubles. Lead cyanamide was investigated as a pigment. Pegmatites were utilized for high-voltage porcelain. Attempts to use high-frequency installations for drying various ceramic products were successful. Experiments were made with a fuelless locomotive, charged with steam from a stationary boiler. The absorption of sulphur dioxide from smoke by means of magnesia was held practical for large power stations near contact sulphuric acid plants. Small amounts of alkali were added to the flushing fluid in drilling for petroleum to lower the hardness of rocks. The complete utilization of larch was outlined. Phthalic esters of cellulose were studied. A new fabric consisted of 50% wool and 50% fibre made from lupin-seed albumin. Several experiment stations were at work in endeavouring to improve the silk industry. Passing a direct current through the soil helped the formation of water-resistant aggregates. Ammonium alginate served as the starting material in research on the production of plastic masses.

Union of South Africa.—The government voted £5,000,000 to be used for the promotion of new industries and expansion of existing manufactures, particularly coke and steel. The Minerals Research laboratory conducted experiments on making chromates, bichromates and chromic acid from domestic chrome ore. The government studied the use of charcoal as a motor fuel. A company experimented successfully with the fermentation of molasses by a special yeast under alkaline conditions. The dehydration of citrus fruit was under study and Transvaal farmers considered the commercial production of avocado oil.

India.—Investigations recommended for adoption by the board of scientific and industrial research included manufacture of electro-acoustical and high-frequency apparatus, X-ray transformers, refrigerating machinery, photographic plates and photosensitizing dyestuffs, industrial preparation of essential oils and of ionone from lemon grass, production of thyroxin, extraction of sulphur from pyrite and the manufacture of optical glass. Projects completed by the board related to the manufacture of laminated paper products, resin-impregnated wood, dry cells, glass substitutes and stoving enamel. Steps were taken to assist nascent and undeveloped industries through the Test house at Alipore.

Netherlands Indies.—New uses were sought for molasses. A report was issued on the utility of latex as a protection against glass splinters during bombing raids. Mealorub, a partially vulcanized rubber in granular form, was possibly of importance for blending with bitumens. Experimental work on cinchona was fostered.

Australia.—The Commonwealth Council for Scientific and Industrial Research made a thorough exploration of domestic potash resources. It was decided to manufacture aluminum from domestic bauxite. An Aeronautical Research committee was formed; the suggestion was made to transfer to Australia a considerable part of the aircraft manufacturing of the United Kingdom. Progress was recorded in the introduction of producer gas as an engine fuel, particularly with farm tractors. Phellandrene from eucalyptus was effective as an antiknock; the addition of eucalyptus oil to motor fuel increased power and mileage. Extensive research was carried out on the preservation of fish and on the cold storage of smoked fish and eggs.

New Zealand.—Plans were completed for the production of silico-superphosphate containing serpentine. By an electromagnetic method a 90–95% glauconite was produced from greensand. Research was conducted on the processing of bentonite. The activation of charcoals was studied.

Japan.—It was proposed to vaporize alcohol and gasoline in separate carburetors and to inject the vapours, in proper proportions to each other and air, separately into combustion chambers; acetylene gas and gasoline could be used similarly. Aluminum was being produced from alunite but costs were high; processes using clay were not commercially successful. A chemical warfare department was set up. Employment in the chemical industry had increased 18% since 1937. In Formosa it was said a hemp substitute had been prepared from banana skins. Soybean protein dissolved in 49.5% urea solution was reported to be more stable than in caustic soda—a fact thought to deserve consideration for manufacturing soybean fibre. A fish yarn, a wool substitute under research, was prepared from whale or shark meat protein hardened with formaldehyde. The Japanese ministry of agriculture and forestry claimed success in cultivating a variety of seaweed used for agar-agar with a growing time of 40 days, compared with the usual 2-year period. (*See* also CHEMISTRY; CELLULOSE PRODUCTS; CHEMISTRY AND ENGINEERING, AGRICULTURAL, U.S. BUREAU OF; CHEMURGY; PLASTICS INDUSTRY.)

Infantile Paralysis.

As yet unsolved among the important facts about infantile paralysis by Jan. 1, 1942, were the exact character of the virus that transmits the disease, the symptoms by which it can be diagnosed with certainty, laboratory and skin tests which will permit diagnosis earlier than is now possible and a specific method of inoculation that will prevent the disease.

The Virus.—The virus was isolated in the material from human beings, and animals injected with it developed the disease, but there was much about its characteristics that needed to be known. Unquestionably the virus gets into the body by way of the bowel and passes along the nerve, eventually reaching the spinal column which it attacks, particularly the anterior horn cells of the spinal column. The virus is regularly excreted from the human being by way of waste material from the bowel.

In a study of an epidemic in Western Springs, Dr. E. A. Piszczek and his associates in the laboratory of the Illinois state department of health found a boy who did not have infantile

paralysis—at least the symptoms were not recognized—but who excreted the virus regularly from his bowel over a period of several months. The father of the boy became infected and died. For a good many months after the boy was first exposed to infantile paralysis he still continued to give off from his bowel material containing the virus, and this virus was capable of giving infantile paralysis to a monkey when inoculated into the body of the monkey.

Transmission.—The current belief was, therefore, that infantile paralysis is spread as is typhoid with excretions from the bowel which contaminate the hands, the food, drinking water and other materials taken into the body. Furthermore, flies and other insects which may feed on excretions from the human being can carry infantile paralysis, as has been shown by investigators in various laboratories.

Prevention.—Chiefly important in preventing infantile paralysis are the following procedures: (1) Avoid having children come in contact with new groups of people; (2) see that children take nothing into their mouths that could have been soiled by discharges from the bodies of others; (3) little is gained if a community closes the schools and swimming places and allows the children to mingle with people on the street, in stores and other meeting places; (4) all suspected cases of infantile paralysis should be promptly reported to the local health officer; (5) on the appearance of the very first suspicious symptoms of the disease a physician should be called.

Respirators.—There was a widespread use of respirators or "iron lungs" to aid weakened muscles of the chest when they were unable to function. In 1941 more than 700 respirators were distributed throughout the United States. The National Foundation for Infantile Paralysis, 120 Broadway, New York city, prepared a pamphlet in which the location of each respirator was indicated. Evidence accumulated by Dr. J. L. Wilson of Detroit showed that in the majority of cases the iron lung is used too late to be of maximum value. Only 52% of patients with infantile paralysis were placed in the respirator on the fourth day of the disease or earlier. Those placed in the respirator earlier had a far greater chance of recovery than those who waited as late as the seventh day of the disease.

Sister Kenny Treatment.—Perhaps the most sensible advance in the control of infantile paralysis was the contribution of Sister Elizabeth Kenny who studied infantile paralysis first while she was nursing in the Australian bush country. In Australia all nurses are called Sister in addition to those of the Catholic orders. Attempts to keep the muscles in the best possible condition during the time the nerves are incapacitated so that the muscles can resume their function when the progress of the disease stops and the nerves begin functioning, promise the greatest possible recovery.

During Sister Kenny's treatment of the muscles, splints, braces and frames are removed from the patient. Hot, moist packs are applied to the muscles to relieve pain. A warm bath, followed by ice sprays, or alternate hot and cold baths, will aid to stimulate the circulation of the blood. At the same time the muscles are trained to continue their function. Fingers, feet, hands, legs and arms are moved to the limit of possible motion or until pain begins. The patient is encouraged to concentrate on the portions which are being moved by the nurse and thus by concentration to stimulate motion through the incapacitated nerve by the mental stimulus as far as possible. Such periods of muscle training are carried out twice daily but also with extreme care to prevent the patient from overdoing and exhausting either muscles or nerves.

In the study of the technique developed by Sister Kenny, the National Foundation for Infantile Paralysis again was most helpful in granting funds to the University of Minnesota, under whose auspices her work was conducted and observed, and at the same time donating funds to physiologists working in various laboratories who studied the nature of the actions of the muscles in order to determine the scientific basis for this form of treatment.

Thus Dr. D. Y. Solandt of Toronto came to the belief that a change in point of view is necessary regarding the function of the muscles. He, too, was convinced along with Sister Kenny that long immobilization with casts and splints may not be most desirable in many forms of infantile paralysis. Moreover, the orthopaedic surgeons in the University of Iowa found that braces, even though properly applied, were unable to prevent deformity in paralyzed limbs and they were agreed that good, if not better, results were obtained by physical treatment to the muscles and joints.

The Armstrong Discovery.—At the meeting of the American Public Health association which was held in Atlantic City in Oct. 1941, a medal was awarded to Dr. Charles Armstrong of the United States public health service for some of his fundamental discoveries with the virus of infantile paralysis. Dr. Armstrong found that the eastern cotton rat could be infected with the virus of this disease, and thus made possible intensive research. Heretofore only the monkey had been the experimental animal which could be adapted to such studies.

Much of the funds of the National Foundation for Infantile Paralysis was devoted to the purchase of monkeys to aid in the intensive research. It seemed likely that the conditions of World War II would prevent importation of monkeys and thus put a stop to all research. In this emergency the discovery of Dr. Armstrong was of the utmost value. However, a shipload of monkeys did arrive in the United States late in October, and the work continued. (M. Fl.)

Infant Mortality. According to final reports, there were 110,984 deaths of infants under one year of age (exclusive of stillbirths) during 1940 in the United States and 2,360,399 births, so that the infant mortality rate was 47 per 1,000 live births. This rate is the lowest on record for the United States. However, provisional reports for the first six months of 1941 received from 39 states show an infant mortality rate of 49.8 per 1,000 live births, somewhat higher than the figure of 49.4 per 1,000 for the corresponding period of 1940 in the same states.

Canada reported 13,754 infant deaths in 1940, with an infant mortality rate of 56 per 1,000 live births; whereas the preceding year, 1939, showed a rate of 61 per 1,000. In England and Wales, there were 33,638 deaths of children under one year of age in 1940, and the infant mortality rate was 55 per 1,000 live births. This marked an increase of 10% over the figure for 1939, when the rate was 50 per 1,000. Provisional reports through Aug. of 1941 compared with the corresponding period of 1940 indicated that there would likely be a further increase in infant mortality in England and Wales in 1941.

The appended table shows infant mortality rates for the principal English-speaking countries since 1921. Throughout this period, New Zealand consistently maintained the record for lowest infant mortality, with Australia as next best. The general decline in the infant mortality rate after 1920 was attributed to improvements in the control of diseases peculiar to infants to increased attention to the problems of nutrition, and to advances in sanitation. But the adverse effect of disrupted homes and of starvation caused by the war was and would be felt in all the countries of Europe, particularly in the occupied areas. A statement from the unoccupied area of France reported a significant rise in infant mortality. The regression of infant mortality in England and Wales has already been described.

Annual Infant Deaths per 1,000 Live Births in the Principal English-speaking Countries, from 1921 to 1940

Year	United States	Canada	England and Wales	Scotland	Northern Ireland	Eire	Australia	New Zealand*	Union of South Africa (whites)

*Europeans excluding Maoris.

Infant mortality in the United States is highest in the south and southwest. The states having the highest infant mortality rates, according to reports for 1940, are New Mexico (99.6), Arizona (84.3), South Carolina (68.1), Texas (68.6) and Louisiana (64.2). The first two of these states contain a large proportion of Mexican population among whom infant mortality is very high, while the last three states have large Negro populations, also with high infant mortality. In addition, Texas has a large Mexican population. The states with the lowest records in 1940 are Minnesota (33.3), Oregon (32.9), Connecticut (34.1), Illinois (35.3), and New Jersey (35.6).

The extent of the variation in infant mortality according to race is provided by data for 1940. In that year, the white population had an infant mortality rate of 43.2 per 1,000 live births, and the Negroes had a rate of 72.9 per 1,000, while among other coloured races the figure was 91.0 per 1,000.

When births and infant deaths are allocated according to place of residence instead of place of occurrence, it is found, on the basis of data for 1939 (the latest available in this respect), that conditions on the whole are best in cities of 10,000 or more, poorest in cities of 2,500 to 10,000, while rural areas fall between these extremes. Thus, in the white population, those in cities of 10,000 or more had an infant mortality rate of 41.1 per 1,000 live births, while the corresponding figures for cities of 2,500 to 10,000 and for rural areas were 50.1 per 1,000 and 46.1 per 1,000 respectively.

A recent survey of infant mortality according to cause of death and subdivisions of age within the first year of life, based on United States

data for white babies in 1937–38, showed that almost two-thirds of the deaths occurring in the first day of life were ascribed to premature birth and about one-sixth to injury at birth. Congenital malformations and congenital debility were also important. In contrast, in the last quarter of the first year of life, about one-quarter of the deaths were from diarrhoea and enteritis, about one-third from influenza and pneumonia, and about one-ninth from the common communicable diseases of childhood. Thus, during the infant's first year of life, the hazards from infectious disease are of increasing relative importance.

Ingersoll, Royal Eason

(1883–), U.S. naval officer, was born June 20 in Washington, D.C., the son of Rear Adm. Royal Rodney Ingersoll. He was appointed to the Naval academy from Indiana, 1901, and after graduation was assigned to several U.S. warships. He was on duty at the Naval academy, 1911–13, when he received orders to join the Asiatic fleet. He went to the office of naval operations in 1916, and during World War I received the navy cross for his services in organizing, developing and directing the communications office of the navy department. After the war he was an executive officer and commander of battleships and cruisers. Pres. Roosevelt in 1938 nominated him rear admiral, jumping him over the heads of a dozen senior officers. On Dec. 20, 1941, Secretary of Navy Knox appointed him commander of the Atlantic fleet to succeed Adm. Ernest J. King (*q.v.*), who was designated commander-in-chief of the U.S. fleet. Ingersoll's appointment followed a shake-up in army, navy and air commands after Secretary Knox toured Hawaii and found U.S. defense forces there "were not on the alert" during the Japanese attack on Pearl Harbor Dec. 7, 1941.

Initiative and Referendum.

Initiative and referendum are used less in odd years because general elections are fewer. Nevertheless a considerable number of questions and measures were submitted in 1941.

Federal.—Under supervision of the agricultural department, marketing control quotas proposed by it were voted as follows: *cotton* (1940), 848,428 to 70,429; (1941, Dec. 13), 743,844 to 48,613; *peanuts*, 64,462 to 9,388; *tobacco* (burley), 111,045 to 29,523; (dark cured), 8,910 to 1,423; (fire cured), 20,109 to 2,697; *wheat*, 453,569 to 106,061. This vote by the wheat growers in 37 states marked the first test of federal marketing control of a major crop chiefly produced outside the south. Reference to dairymen of the department's proposed amendments to New York Milk Order 27 was enjoined by Justice Bailey of the District of Columbia supreme court at the instance of the Dairymen's league, on the ground that the secretary of agriculture had acted "in an arbitrary and capricious manner in attempting to coerce plaintiffs," etc. Under supervision of the Indian office, *referenda* on tribal constitutions resulted as follows: Kiakegee, Okla., 39 to 17; Saxman, Alaska, 31 to 1; Klukwan (Chilkat village), Alaska, 34 to 4. On charters, the vote in the two latter places, respectively, was 32 to 0 and 35 to 3; in Big Valley, Calif., 17 to 0; Shivwitz, Utah, 34 to 2; Goshute, Utah, 33 to 0; Port Gamble, Wash., 36 to 0.

State.—*Georgia* voted on 70 proposed constitutional amendments, most of which authorized specific local units to issue refunding bonds or make other fiscal adjustments, and were adopted as was an amendment extending to four years the terms of "governor and other constitutional officers" (50,110 to 30,190), thus providing such a term in one-half of the states. A proposal for annual legislative sessions was rejected (28,519 to 28,238).

Illinois.—In Rockford, where the schools, facing a deficit, were ordered closed Nov. 7, 1941 to Jan. 5, 1942, an increase of the educational tax rate of 50 cents per $100 on the assessed valuation, voted (8,820 to 3,989) on Dec. 16, insured a continuous school session of 9½ months.

New York voters, on the other hand, rejected (880,684 to 588,694) a proposal to extend the terms of state senators to four years; but adopted amendments authorizing appropriations and bonds for highway improvement (936,279 to 629,313); constitutional changes without an attorney general's opinion (776,385 to 558,638); "ski trails" on certain slopes of Whiteface mountain (740,506 to 730,562).

New York City.—The long sought, but persistently frustrated, abolition of useless county officers in greater New York was at last voted by the electors on Nov. 4 (509,284 to 228,019). It substitutes for similar officers in each of the five counties a single sheriff and single registrar to be appointed by the mayor from a list of three certified by the civil service commission, under which also the office employees are to be selected.

A separate proposal for retaining incumbents not under civil service was rejected (379,617 to 306,454), as was also another (390,397 to 316,159) making the city-wide sheriff an elective officer.

Westchester County.—A proposed amendment of the county charter, substituting a county board of 11 members for the present 44, was rejected (57,398 to 41,342), although the county is said to have "6,500 employees and annual operating costs of $77,000,000," which might be considerably reduced by "a smaller and more responsible board, divorced from town politics and not so amenable to log-rolling."

Peekskill rejected proposals to: (1) increase the tax levy to pay maturing bonds (964 to 396); (2) seek permission to refund said bonds (784 to 427); (3) issue new bonds for fire apparatus (726 to 486).

White Plains voted (4,836 to 2,371) against approving an ordinance fixing the mayor's salary at $5,000.

Wyoming County.—Castile voted (1,895 to 1,223) continuance of prohibition of intoxicating liquor sale.

Oklahoma, whose state debt had mounted in ten years to $32,000,000, adopted on March 11 amendments (1) prohibiting legislative appropriations exceeding an official estimate of the average state income for the three previous years, without the levy of new taxes to meet the excess (163,886 to 85,752); (2) removing the limit on appropriations for "relief and care of aged or needy" (193,170 to 59,838); (3) co-ordinating all state-supported institutions of higher learning (including others conditionally) into a "state system" under a board of regents with terms of nine years each, appointed by the governor and confirmed by the state senate (152,173 to 95,617).

Washington.—On March 11 Spokane voters, for the second time within five months, rejected (26,609 to 17,279) a proposed ordinance authorizing the city commission to purchase and distribute, through acquisition either of the existing Washington Power company plant or a new and competing one, retail power from the Grand Coulee dam.

Rumania.—Premier Gen. Antonescu's dictated plebiscite on March 12, to "express approval or disapproval" of his regime brought 2,490,944 in favour and 2,816 against. All Rumanian Jews (estimated at 750,000) were barred and radical Iron Guard elements had been purged and others cowed. Not content with this "vindication," he ordered another for Nov. 3, preparatory to making Rumania "a corporative state" within the "new order." Result 3,446,689 to 68. Such gestures are of course only "pseudo-plebiscites."

St. Pierre and Miquelon.—On Christmas day, 1941, the day after Free French forces had seized the islands, a plebiscite of the male population was held, in which 650 voted for Free France and 10 for Vichy France; 100 votes were voided.

Insurance, Accident and Health.

Accident, health and hospitalization insurance had another successful year in 1941, with premium income increasing 12% to a new high level of more than $316,000,000.

Hospitalization coverage continued popular. It was fairly well recognized that such protection is underwritten more satisfactorily on a group basis. Some companies writing on an individual basis insisted that hospitalization policyholders carry loss of time coverage as well. The importance of hospitalization coverage in relation to loss of time protection had been overemphasized, U.S. government survey figures showing that only one out of ten cases of disability attended by physicians was hospitalized.

Although practically all accident and health policies contained clauses excluding claims from "war or acts of war" for the last 25 years, the new type of warfare involving civilians introduced the need for a new definition of "act of war." Companies were generally agreed that they would pay claims for accidents suffered during blackouts but that bombing attacks obviously would be considered an "act of war." However, several companies announced that they would pay claims for injuries to civilians during air raids, thus creating a disturbing competitive situation. Opponents to such an extension of coverage held that it was more important that a company protect its solvency by war clause restrictions rather than risk impairment in claim-paying ability. A number of companies reduced their age limits on accident coverage from 14 to 16 down to 5 to 6. (C. D. SP.)

Great Britain.—The outstanding feature of the accident business of British offices during 1941 was a reduction in the premium income, amounting in the aggregate to about 25% of the pre-war figures. Results published during the year, relating to the business of 1940, improved on previous years and most companies earned excellent profits.

Personal accident insurance contracted as a result of financial stringency, but some new business was done in war risks covers. Workmen's compensation insurance increased because of the expansion of industry due to the war effort. Premiums in this section were adjusted to a 65% claims ratio and the profit was small. No alterations were made in the Workmen's Compensation act, since the Royal commission appointed to consider the subject suspended its labours for the time being. In third party insurance a house of lords decision dealt with the question of damages for loss of expectation of life and should reduce the high figures which had previously been awarded under this heading.

Insurance against loss of or damage to property, such as burglary and plate glass, was affected by difficulties in replacement of property. Aviation insurance was of growing importance but was largely transacted by specialist offices. (*See* also INSURANCE, AUTOMOBILE: *Great Britain;* LAW.) (C. E. G.)

Insurance, Automobile.

Automobile casualty loss ratios hit an all-time high in 1941 in the United States. The companies showed a sizable underwriting loss for the year's operation on a volume of business slightly larger than that written during 1940. The greatly increased frequency of accidents, due to increased use of automobiles, and rising claim settlement values contributed substantially to this underwriting loss. Rate levels remained approximately the same as during 1940.

The standard automobile policy underwent a further revision through the removal of restrictions relating to carrying passengers for a charge and the age limitation of the driver.

Rate levels and loss ratios for fire and theft remained substantially unchanged, while the volume of such business moved upward. Collision rates, however, were increased as a result of higher loss ratios, the same factors contributing to this increase as were mentioned in connection with the casualty lines. The same changes were made in the fire, theft and collision policy forms as were made in the casualty forms.

The revised New York Financial Responsibility law was the most important automobile insurance legislation of the year. Its emphasis is on compelling the motorist to purchase insurance. The ultimate effect of the law should be approximately the same as the compulsory law in effect in Massachusetts. The lead taken by New York in insurance legislation is usually followed by many other states, and it seemed therefore probable that the future would see similar laws adopted in other states with a resultant increase in automobile premium volume. (G. E. Ho.)

Great Britain.—Owing to wartime restrictions the volume of motor insurance contracted sharply in 1940 and the tendency was more pronounced in 1941, though exact figures were not available in the closing months of the year. The reduction was mainly in the private car section, as so many cars were laid up and insurance was required against fire and theft only. The claims experience was less favourable, for road accidents showed a steady increase month by month as compared with former years. This appears not to have been due solely to blackout conditions, though those played some part in the depreciated experience. Damage claims were delayed by difficulties in obtaining spare parts. It was unlikely that motor insurance as a whole would show much profit when the year's results were ascertained but rates had not yet been increased.

Certain special types of policy were found necessary for vehicles used by local authorities, air-raid precaution organizations and the like in public duties. (C. E. G.)

Insurance, Fire.

The business of fire insurance on the whole did fairly well in 1941 in the United States. To be sure, there was an increase in the amount of the losses to be paid, but there also was an increase in the volume of premiums, so that by and large the general results were fairly satisfactory. The untoward conditions were those which probably affected most businesses; namely, a decrease in the returns on the invested funds and an inevitable increase in expenses. Fire insurance, however, has one great advantage over many businesses in that its product, so to speak, is sold over an enormously wide territory and the skilled underwriter learns to spread his liabilities so that an undue loss may not occur at any one point. This comfortable condition may be jarred by an unusual loss and during 1941 there was one at Fall River, Mass., caused by the partial destruction of the large rubber plant and stocks on Oct. 12. The loss was estimated at $15,000,000, but as it had not been fully adjusted before the close of the year 1941, the net loss figure was not available. However, the figures given sometime after the fire did not seem to be any less than those first reported. This one loss, taken as reported, was sufficient to account for the increase in the fire loss over the year 1940.

In 1938, it was predicted that there would be normally a steady increase in the losses in the following years; that prophecy was being fulfilled.

One outstanding feature which would affect fire insurance and cause a re-examination of past practices was the form known as use and occupancy insurance. This protects the owner against the losses and carrying expenses which he incurs and is subject to the interval from the time his plant ceases to operate and until it is restored. In times when material to rebuild and material to reoperate are normally available in the markets this is a safe line of insurance to underwrite, but under conditions of World War II, when the priorities might make it impossible either to get material to rebuild the plant or to operate it if rebuilt, this form of insurance took on a new aspect and one which had to be re-examined. (*See* also FIRES AND FIRE LOSSES.)

(E. R. H.)

Insurance, Life.

While the federal government of the United States furnishes a limited amount of protection for dependents under the widows' and orphans' benefits of the Social Security act and for members of the armed services under the War Risk and National Service Life Insurance, the legal reserve life insurance companies of the United States and Canada continued to provide most of the life insurance protection available to the people of North America. At the end of 1941, the total life insurance in force in these companies was estimated at more than $130,000,000,000 (excluding reinsurance) or a gain of 5% over 1940. The new business issued during the year amounted to more than $13,000,000,000, which was 10% more than issued in 1940. The assets of the companies at the end of 1941 amounted to almost $35,000,000,000, after paying or crediting to policyholders and beneficiaries about $2,800,000,000 during 1941.

The mortality experienced in the United States and Canada during 1941 continued favourable. The continued decline in pneumonia mortality despite a widespread influenza epidemic early in the year, offered convincing proof of the value of chemotherapy in the treatment of this disease. The downward trend of the tuberculosis death rate was also maintained. The principal unfavourable features of the year's mortality were the sharp increases in the death rates from automobile and industrial accidents, the latter being in large measure due to the increased industrial activity in 1941.

Life insurance companies continued to experience difficulties in finding an adequate volume of appropriate and remunerative investments for their new funds. The extent of life insurance companies' participation in the financing of national defense was indicated by the fact that their portfolio of United States and Canadian government securities increased by about $800,000,000 during 1941. However, the yields on both government and corporate high grade bonds reached new all-time-record lows during 1941 and there appeared to be little prospect of any material improvement in the interest rate. Reflecting to a marked degree the low yield obtainable on suitable new investments, the interest rate earned during 1941 on the aggregate of life insurance company assets continued on the downward trend characteristic of

recent years. Because of the continued low level of interest rates and because of the requirement by New York state that industrial policies written on and after Jan. 1, 1942 be valued on modern industrial mortality tables, several large mutual companies writing both ordinary and industrial insurance announced changes in the legal reserve bases for life insurance to be issued in 1942. The reserves of these companies on new business will be determined on the basis of interest rates lower than 3% and on more modern mortality tables. This was the first time in the history of American life insurance that interest rates lower than 3% would be used for life insurance reserves. Because the effect of the low interest rates greatly overshadowed the recent improvement in mortality, higher premium rates would be charged by these companies for new insurance. While the changes in premium rates charged did not, of course, affect policies issued in the past, the low level of interest rates responsible for the changes already was reflected in decreased dividends on participating policies issued in the past and probably would continue to be so reflected in the future.

Prior to the entry of the United States into the war, only a very small proportion of life insurance policies in force on citizens of the United States contained any limitations of the life insurance benefits or required the payment of extra premiums in the event of war service. However, after the entry of the United States into the war, a number of companies announced that war clauses would be incorporated in all policies to be issued. While the companies would absorb the war risk on practically all of their existing policyholders, the safety of the insurance of the general body of policyholders demanded that companies take the necessary precautionary measures in respect of new insurance. The extra hazard of war was a risk which to a limited extent was assumed by the government through National Service Life Insurance. (*See* also LAW; SAVINGS BANKS, MUTUAL.)

BIBLIOGRAPHY.—*The Spectator (Life) Insurance Year Book* (1941); *Proceedings*, Association of Life Insurance Presidents (Dec. 1941); *Report* of the Superintendent of Insurance of the Dominion of Canada, vol. II (Ottawa, Ont., 1941). (L. A. L.)

Insurance, Marine.

The surprise attack by the Japanese on Pearl Harbor and other United States possessions in the Pacific on Dec. 7, 1941, followed by the action of congress in declaring a state of war existed between the United States and Japan, Germany and Italy, was the culmination of the surprising events which happened throughout the year 1941, causing marine underwriters to make swift changes in their quotations to meet changing conditions.

Following Italy's entrance into the war against France, President Roosevelt extended the "combat zone" so that U.S. ships were prohibited from trading with Great Britain, Ireland, the entire continent of Europe including the Mediterranean sea and the north coast of Africa. Portugal and part of the Spanish Atlantic coast were excepted. As a result, the regular U.S. service maintained to Lisbon was the only U.S. service to Europe. Closing the Mediterranean to U.S. ships necessitated substituting Greek ships to transport tobacco from Greece and Turkey. After long negotiations with both Great Britain and Italy to secure safe conduct for a number of these ships from Greece past Gibraltar enroute to the U.S., Italy suddenly declared war on Greece and bombed Greek ports. One of the ships loaded with tobacco was bombed and sunk, the others escaped to Alexandria where new arrangements had to be made to continue to the U.S. by another route. New freight rates and insurance rates had to be negotiated and there were delays in waiting for convoys and for fuel. The ships went through the Suez canal and around the Cape of Good Hope, thus crossing the equator twice. As a result of this long voyage and the length of time the tobacco was loaded on board, in some cases for five months, the losses were very large. On every one of the seven ships that arrived in the U.S. at the beginning of 1941, the cargo had suffered damage; in all, the claims exceeded $3,500,000, which constituted the most serious marine cargo losses of 1941.

The necessity of rerouting voyages and, more serious, the diversion of many regular liners to war service, requiring the substitution of older and frequently greatly inferior ships, was a cause of anxiety to underwriters. A committee of the American Cargo Marine Reinsurance clearing house recommended rates on these outside ships and, though such rates are official only in respect to reinsurance through the clearing house, they were generally followed in the market. Due to trade being brought to a virtual standstill with the axis countries and the countries they had overrun, the volume of cargo premiums was reduced; it was further reduced by the requirements of U.S. neutrality laws to the effect that title had to pass from U.S. owners to purchasers abroad before materials could leave the United States for belligerent countries, which resulted in the insurance on such goods being placed by the purchasers in their own market.

Cargo Losses.—A matter causing underwriters much concern in 1941 was the government's taking over of the entire importation of certain strategic materials. The government had in 1941 a complete monopoly on imports of rubber, tin, tungsten, manganese and several other commodities, and was adding to the list from time to time. This meant that all regular commercial trading in these items ceased. However, the government continued to carry marine insurance on these imports and reinsurance arrangements were made so that the liabilities were well spread throughout the market. The worst single loss cargo underwriters in the U.S. ever experienced came under these policies—the fire at the plant of the Firestone Rubber & Latex company, Fall River, Mass., on Oct. 12, 1941. Loss on the rubber stored there amounted to approximately $15,000,000. As a result of this heavy loss on such a vital commodity as rubber which might be very difficult to replace under conditions existing around Malaya and the Dutch East Indies in 1941 and 1942, the government was rearranging storage plans so that the quantity subject to one loss would be materially less.

A large percentage of the marine cargo losses in 1941 arose because of war conditions but were not actually caused by war perils—these included collisions while travelling in convoy, entering and leaving ports without proper aids to navigation, congested conditions on piers at certain ports, and the necessity for utmost haste in loading and unloading.

In 1940 a surcharge was agreed upon to be added to the regular marine rates on all shipments to the United Kingdom, the continent of Europe and North Africa. Later the area was increased to include the Red sea and all the near east. Experience showed the surcharge was not sufficient to cover the losses, and with Japan and the axis countries waging declared war on the U.S., it seemed probable that the surcharge question would receive further attention and that the area of its application as well as the rate charged would be increased.

Hull Business.—Hull business in the U.S. market showed a considerable increase in premiums. Shipowners were placing a larger percentage of their business in the U.S. than formerly. In addition, hull valuations were largely increased. On many vessels the amount of insurance carried was double the amount carried in 1940. Because of this, premiums increased although rates remained fairly steady, but with repair costs on the increase it seemed probable that rates must be increased in 1942.

The most severe hull loss of the year was the stranding of the "Manhattan" near Palm Beach, Fla., on Jan. 12, 1941, while on voyage from New York to the Pacific coast via the Panama canal.

The cost of repairs alone exceeded $2,000,000 and there was a further claim for salvage services which had not been settled at the close of 1941.

War Risk.—War risk insurance continued with increasing volume. The American Cargo War Risk Reinsurance Exchange demonstrated that it could satisfactorily meet the requirements of U.S. importers and exporters. Originally there were three rates on each trade route, the lowest for cargo carried by U.S. flag ships, then somewhat higher by other neutral flags, and third, a still higher rate when carried by a belligerent flag ship. Early in 1941 in western hemisphere trade there were only two rates—United States and other neutrals, one rate, and belligerent, a higher rate. Later there was only one rate for a trade, applying to all ships. Rates remained fairly constant through the year. Rates to the near east were raised when the Germans invaded Greece, and to the far east when Japan moved into Indo-China and threatened the Dutch East Indies and Malaya. On the other hand, when the United States started an Atlantic patrol and sinkings in the North Atlantic decreased, the rates to Great Britain were reduced. Of course, after the Japanese attack on Pearl Harbor, all rates in Pacific trading were substantially increased. Hull war risk business also increased during the year 1941. Most of this was written through the American Marine insurance syndicates but a considerable volume, particularly on ships of the Latin American republics, was written throughout the market.

At the beginning of 1941 many owners operating in coastwise, intercoastal, West Indies and South American trades did not think there was any danger from war perils in the western hemisphere for U.S. flag ships and did not carry war risk insurance. However, they began to carry it from the time the "Robin Moor" was sunk in the Atlantic in May 1941. It appeared probable that in 1942 every ship in ocean trade would carry war risk insurance. As with cargo insurance after the U.S. entered the war, there was only one rate in each trade route irrespective of flag, and all rates in Pacific ocean, West Indies and South American routes were increased.

The most important war risk losses on cargo during the year 1941 were on the Greek steamer "Petalli" bombed in Piraeus harbour in April, loss principally on tobacco amounting to about $3,000,000; the Norwegian steamer "Silverplana" long overdue in New York from the Dutch East Indies, believed to have been sunk by a German raider in the Pacific, loss estimated to be approximately $2,000,000; the Dutch steamer "Kota Nopan" also on voyage to the U.S. from the Dutch East Indies, sunk by German raider, loss $1,630,000.

Losses on United States hulls were slight, largely because they were prohibited from trading in war zones, but with the Neutrality law amended to permit their trading anywhere and the country at war, U.S. ships would be used in 1942 to carry lend-lease materials to the anti-axis allies and losses would be heavier.

Inland Marine.—There were no developments of special importance in the inland marine field. There was considerable agitation to permit the issuing of the Personal Property floater in states where it was prohibited. This form was approved by Rhode Island as of Nov. 1, 1941, the first of the eastern states to approve it. As of Dec. 15, the companies writing inland marine agreed not to write war risk on shore. Ocean marine companies did not write this after 1939. Protection of private property on shore in the U.S. from war perils was to be arranged for by the government through the newly formed War Risk Insurance corporation.

Interior Decoration.

The year 1941 was a difficult year for the designer, but stimulating to his creative ability. Because designers were necessarily called upon to use substitute materials effectively and to simplify design, much emphasis was placed on simplicity in design of all furnishings and on their practical application.

Interior Trim and Floors.—A growing preference for simple wood casings, baseboards, etc., was noticeable, and even period interiors showed a tendency toward lighter wood finishes and less use of painted trims. Various hardwood floors were used extensively, as well as prefabricated parquet flooring. The use of tile and brick floors greatly increased during 1941.

Floor Covering.—The use of rubber and cork flooring was considerably curtailed. Carpets and rugs continued to be equally popular, dependent on their suitability to the location. Plain colours still were favoured; the most popular colours for floor coverings as well as other furnishings were greens, shades of rose, blue and grayish beige tones. The demand for textured effects contributed to the development of such interesting weaves as a loosely looped construction, a shaggy and a long cut twisted texture, and various plain and multicoloured grass rugs.

Wall Treatment.—Although walls were most frequently painted or papered, such materials as grass cloth, plywood panelling and prefabricated wood veneers on wallboards and plain prefabricated wallboards were increasingly preferred for the major rooms, with linotile, specially manufactured prefinished wallboard materials, tiles and glass employed extensively in baths and kitchens.

Window Treatment.—Most over-curtains were made of figured linens, printed chintzes and plain rough-textured fabrics, with the curtains to a great extent treated simply. A trend toward eliminating valances and lambrequins was evident, and all trimmings used were very simple. Window blinds, such as woodweb venetian and linen folding shades, instead of casement curtains, were coming more into the limelight.

Furniture.—Furniture finished in lighter, natural colours maintained its popularity. A new type of moulded plywood chair was introduced, and combination case goods units showed further improvement. Entire pieces of plastic furniture as well as plastic hardware in various shades were increasingly developed. Reed, bamboo and rattan furniture became more prominent for various interior rooms, and built-in pieces of furniture were frequently used in recreation and other informal rooms. (*See* also FURNITURE INDUSTRY.)

Furniture Coverings.—Plain rough-textured fabrics were still preferred for both traditional and contemporary furniture. Like floor coverings, upholstery colours remained somewhat subdued to offset the boldness of colour and design prevalent in wallpapers and draperies. In more formal settings, velvets, damasks, brocades, etc., were still predominant. Slip covers, popular for year around use, appeared in bold chintzes and printed cottons and linens.

Lamps.—Forms were simpler, straighter, taller. A Regency or American Federal revival prevailed in lamps as in other home furnishing items. For modern settings, glass, plastics and wood were adapted for bases, while natural coloured shades predominated. Shades were made of grass cloth, rough fabrics, paper—such as metallic paper in strong, bright colours, gold and silver—parchment and silk.

Lighting Fixtures.—More indirect lighting fixtures and fewer side brackets were present not only in contemporary rooms but also in traditional rooms. Fluorescent lighting for the home as well as for commercial use was decidedly improved. In lighting fixtures and in practically all other home furnishings plastics contributed a great deal.

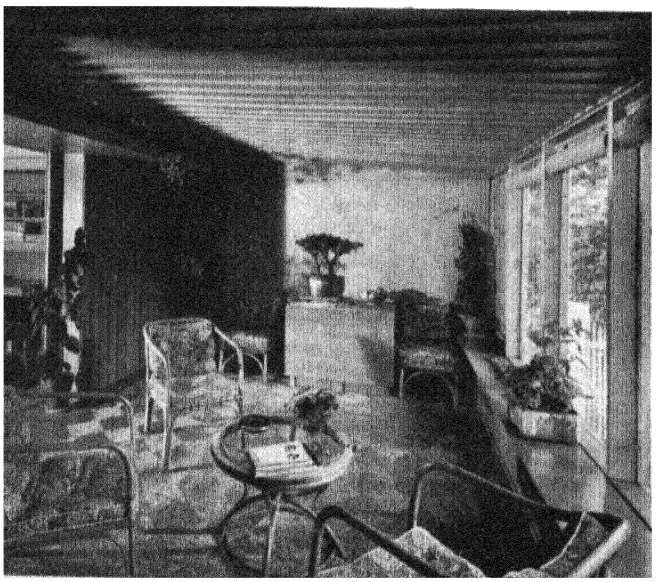
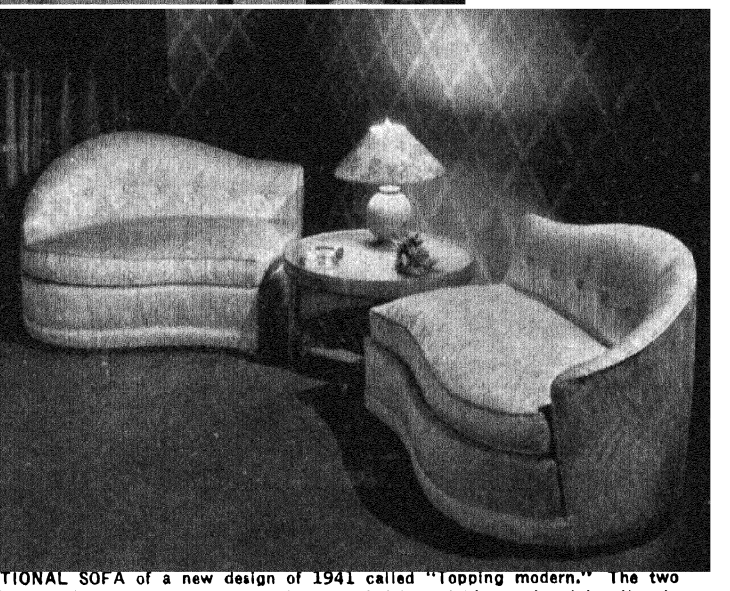
FEDERAL FURNITURE, inspired by national emergency, returned to favour in 1941. This classical bedroom grouping of solid mahogany featured the U.S. eagle on the centre finial of the mirror, the wall sconces and the lamp base

PORCH remodelled into a lounge room, where windows are removed and replaced by screens for summer. Plants supplement the need for curtains





SECTIONAL SOFA of a new design of 1941 called "Topping modern." The two sections, equipped with casters, may be separated by a table or placed together to form a single large sofa

Accessories.—*Glassware:* Good proportions and simplicity of design were stressed more than elaborate and finely cut glassware. Coloured glass was used to a minor extent.

Dinnerware.—Informality was the trend, with an American "feeling." Colours most popular were shades of pink, yellows, blue and the so-called Regency colours.

Other Decorative Accents.—Art objects such as figurines, vases, bowls, etc., showed a decided Chinese influence. This carried out the current trend for combining Chinese design with modern.

Plant Life.—Owing to the decided trend toward simplification of home furnishings and the use of few curtains, various types of plants were extensively used, often taking the place of draperies when placed about a window. Graceful, exotic plants enhanced the Chinese feeling which prevailed in accessories. (G. M. J.)

International Labour Conference: *see* INTERNATIONAL LABOUR ORGANIZATION.

International Labour Organization.

When the sturdy little group of I.L.O. experts and their assistants recovered from the shock of the storm that drove them from Geneva to the new working centre in Montreal, Canada, they took a leaf from the militarists who caused their plight. They consolidated and reorganized their forces and started a new offensive in the quest of social justice.

Substantial contributions were made to the maintenance of the democratic way of life and new values found for the three-way system of representation and discussion of fundamental tasks of governments, management and labour in countries at war or at peace; there was promise of greater contributions to the foundations on which a reconstructed world could be built and postwar difficulties minimized and successfully managed.

The wise and skilful leadership of John G. Winant ceased when he was called to the post of U.S. Ambassador to Great Britain. Edward J. Phelan —an Irishman and a highly trained British civil servant, who had helped in the creation of the I.L.O. in 1919—was the first official appointed by the first director. This man, who had rendered longer distinguished service than any other, became acting director Feb. 16, and later was confirmed with all the powers of director.

With a budget of 4,000,000 Swiss francs, about half that of 1940, the office in 1941 maintained services to member states not greatly different in their immediate utility from those previously rendered.

Studies and reports on timely topics included: *I.L.O. and Reconstruction* (112 pp.), *Organization for Seamen's Welfare in Great Britain, Building Social Security, Latin America and the International Labor Standards. The International Labor Review* appeared monthly in English, French and Spanish. The *Legislative Series* continued publication of the text of laws and regulations from all parts of the world regarding labour questions. *Industrial Safety Survey*, supplements to *Occupation and Health, I.L.O. Year-Book, Year-Book of Labor Statistics,* appeared or were expected to appear soon. *The Labour Situation in Great Britain* (56 pp.), *Labor Supply and National Defense* (245 pp.), and *Wartime Developments in Government-Employer-Worker Collaboration* (152 pp.) were important publications; still more, the *International Labor Code,* 1939 (920 pp.), a classified, annotated edition of the obligations and standards of all I.L.O. conventions, prepared by C. W. Jenks, legal adviser of the office.

No new conventions had been adopted since 1939, but ratifications of old ones were registered—23 after the outbreak of World War II—bringing the total to 882. The implementation of ratifications, technical tripartite conferences, advisory services to governments, employer- and employee-organizations of member states, preparation for war and postwar problems gave Montreal plenty to do. Better contacts with rapidly increasing industrialization under war pressure in the western hemisphere meant new opportunities and added responsibilities.

International Labour Conference.—The Extraordinary (1941) International Labour conference of the International Labour organization, held at New York, N.Y., and Washington, D.C., Oct. 27–Nov. 6, set a high-water mark in I.L.O. history. All 25 previous constitutional conferences for treaty-making and legislative purposes—except the first in Washington, D.C., 1919, and the second, a maritime (special seamen's) conference, in Genoa, Italy—met at Geneva. Regional and tripartite technical conferences were held elsewhere in the U.S.A. and the western hemisphere.

The New York conference met at Columbia university and held its closing session, on the invitation of President Roosevelt, at the White House. Pres. Nicholas Murray Butler of Columbia university called it "the most important international gathering . . . in several years." Thirty-four nations, I.L.O. members, were represented and one former member sent an observer. Twenty-two had tripartite delegations representing workers, employers and governments, which last included 17 members of cabinets and ministries.

Since the fateful world situation made the adoption of long-term instruments such as conventions and recommendations inappropriate, this conference did not meet to adopt conventions but to confer on the role of the I.L.O. in winning the war to preserve the democratic way of life and social security. It was remarkable for the unanimity of opinion and determination expressed in the debates on two questions on the agenda: the report of the acting director on "The I.L.O. and Reconstruction" and "Methods of Collaboration between Public Authorities, Workers' Organizations and Employers' Organizations."

The gist of the resolutions unanimously adopted was: (1) The social objectives of the Atlantic charter, enthusiastically endorsed, must be implemented by measures which the technical experience and facilities of the I.L.O., with its representation of labour and management, well fits it to pledge. The governing body was requested to bring to the attention of governments the desirability of associating the I.L.O. with the planning and application of measures of reconstruction; to ask that it be represented in all peace or reconstruction conferences, and that governments not having such agencies set up representative agencies for the study of the social and economic needs of the postwar world to consult with appropriate organs of the I.L.O.; and that the governing body, from its own membership, set up a tripartite committee to study and prepare measures of reconstruction, and emergency measures to deal with unemployment, in co-operation with governmental, intergovernmental and private agencies. (2) Economic and social objectives must be harnessed for effective teamwork, and steps taken to expand at once, within the framework of the present constitution, the economic functions and competency of the I.L.O., with further enlargement in view in postwar arrangements. (3) Economic and social measures to secure prosperity and social justice in the textile industry and in the mercantile marine. (4) Effective collaboration in wartime and postwar reconstruction requires the full collaboration of public authorities, employers', and workers' organizations, "within the framework of democratic political institutions." (5) Full technical aid and co-operation of the I.L.O. is promised regional, national and local public agencies, in response to requests, to Latin-American, Asiatic and central European and Balkan countries. (*See* also CHILD LABOUR; LEAGUE OF NATIONS; REFUGEES.) (S. McC. L.)

International Law.

The most notable event of the year for the United States was actual entrance into World War II. Neutrality was not strictly observed for the two years preceding that event, and that had given rise to considerable legal difficulties. The destroyer deal with Great Britain, the so-called lend-lease acts, the amendment of the neutrality act, the freezing orders on the funds of nations and nationals seized by Germany, the assistance given to China—all looked toward eventual entry into war. This was called non-belligerency, but that status was not recognized in international law. It apparently had been used to justify departures from neutrality while hoping to escape belligerency. The term had been used in another sense by several of the Latin-American countries which regarded the United States as a "nonbelligerent," in order to accord preferences to American naval vessels in the South American harbours of countries not at war. The Central American countries, with the exception of Mexico, declared war on Germany, Italy and Japan. Neutrality was becoming more difficult. The neutral state was in much the position prevailing in the 15th and 16th centuries when neutrals had to align themselves with one or the other belligerent and risk much on the correctness and eventual success of their preference. Neutrality was designed to avoid the necessity for such a choice.

Arbitration.—Even during the war year of 1941 some successful arbitrations were agreed upon or concluded. The Trail Smelter case between Canada and the United States was settled by an award of March 11, 1941, fixing liabilities for the escape of fumes from the Canadian smelters which injured farms in the state of Washington. On Nov. 19, 1941, Mexico and the United States agreed on a valuation, for purposes of compensation, of the oil properties expropriated by Mexico March 18, 1938. It was understood that the subsoil rights were to be valued together with the surface properties. The payments were to be stretched over a period of seven years from 1942. The agreement covered also a settlement of the general claims against Mexico since 1868, on which awards in many cases had already been made. By instalments Mexico would pay $40,000,000 on this account. The revolutionary claims were settled by awards and annual payments were being made under the agreement. The Ecuador-Peru boundary dispute, pending intermittently for more than a century, was about to be settled on the basis of the status quo of 1936. Ecuador had claimed three large provinces of northern Peru but apparently relinquished this broad claim. Chile and Argentina agreed to entrust to an American citizen the arbitration of their respective claims to Antarctic lands. Bolivia, subject to government ratification, agreed to purchase the properties of the American-owned oil company whose concession it purported to cancel by executive decree in 1937.

Legal Issues.—The "Robin Moor," an American ship with considerable contraband for South Africa, was torpedoed in the South Atlantic by a German submarine before the 1941 change in the neutrality act. Although the passengers fortunately were ultimately rescued, the United States made claim on Germany for alleged illegal sinking, a claim which Germany rejected. The repeal of the neutrality act sections 2, 3 and 6 made it possible to arm American ships and to send them into war zones or anywhere else. By arming they voluntarily assumed the risks of attack without warning and subjected to the same risk American unarmed ships, since the sub-

marine is unable to make a distinction between the two.

Even before the outbreak of official war with Germany and Italy Dec. 11, some German and Italian consulates, such as the German in San Francisco and the Italian in Newark and Detroit, were closed by request of the United States government, which was privileged to withdraw exequaturs when the consuls became *persona non grata*. The ground alleged was the use of these consulates as propaganda agencies. A protest was made to Sweden in June for permitting the passage of German troops from Norway to Finland. In March the 1817 treaty ban on the construction of warships in the Great Lakes was lifted by agreement with Great Britain.

The U.S. policy toward private property even before December 10 presaged the approaching belligerency. The first blacklist was published July 19, containing the names of firms in Latin America with which citizens of that country were forbidden to do business. Many hundreds of names were on this list, which was amplified from time to time. In individual cases names were also deleted. The "freezing" of assets of all foreigners domiciled in countries of Europe occupied by Germany was undertaken in 1941 as a measure of conservation of the assets and a means of preventing them from being disposed of by German agents or by others for the benefit of the German occupant. Licences helped to relieve the hardships created by this freezing, which gave rise to a number of cases mentioned below. The private property of certain foreigners was also forfeited or requisitioned on a considerable scale before Dec. 11. The main item consisted of Italian and German ships which had sought refuge in U.S. harbours. In numerous cases the Italian ships had been sabotaged, whereupon under United States laws the seamen were prosecuted and the ship declared forfeited. Italy protested on the ground that the ship was free to injure itself if it did not injure other ships or the port or the freedom of navigation. This question might one day be judicially determined by international arbitration. Some Danish, Swedish, Norwegian and French vessels were also taken over under the right of angary and would presumably be compensated for at full value. An inter-American economic committee in May passed resolutions authorizing the requisition of refugee tonnage. The shortage of tonnage led to a distinction between unused, laid-up tonnage and that used in active navigation coming on occasion to neutral ports of call. Whether such a distinction would become law remained to be seen.

The United States unilaterally withdrew its participation in the International Load Line convention of 1930 on the alleged doctrine of *rebus sic stantibus*, that is, that "changed conditions" warranted release from treaty obligations. This legal contention was severely criticized by Professor Briggs in the *American Journal of International Law*, 36:89.

The German steamer "Odenwald," falsely flying the American flag, was seized by an American cruiser in Nov. 1941, after an attempt had been made to scuttle the ship. She was libelled in Puerto Rico on a claim for salvage, although she had not wished to be saved. The case was pending at the close of 1941. Had the seizure taken place after Dec. 11 the libel would have been for condemnation in prize.

Governments in Exile.—The war in Europe and U.S. legislation consequent thereon created numerous problems for U.S. courts in 1941. Conflicts between decrees of the governments in exile in London and orders from the German occupying authority in Holland, Denmark, France and other countries as to the disposition of property in New York banks and elsewhere in the United States led to important cases. The policy of United States and New York law was to admit the right and power of the governments in exile, formally recognized by the United States, to issue decrees governing the nationals of those countries and their property abroad. The Dutch decree of May 24, 1940, vesting the control of all Dutch-owned assets of the United States in the Dutch government in London acting through the Dutch minister in Washington, was recognized as valid by the New York courts partly on political grounds but also on the ground that it was not a confiscatory but a conservatory measure. The courts subordinated to the Netherlands decree the claims of an alien or his assignee based on a foreign cause of action and an attachment subsequent to May 24, 1940. The New York law of 1941 undertook to protect banks in refusing to pay deposits on demands from occupied countries whose governments were not yet recognized as *de jure* by the U.S. The U.S. freezing orders undertook not to expropriate but merely to restrain the transfer or payment of money in the custody of American nationals with a view to protecting "the dominated nation and its nationals and American creditors."

There seemed to be a growing disposition in American courts, now that the United States by assignment under the Litvinov agreement was the assignee of claims owned by the soviet government in the United States, to endeavour to sustain, contrary to the earlier views, soviet decrees confiscating Russian property in the United States at least when the rights of American citizens or creditors were not involved. It would be interesting to see whether French and other foreign decrees purporting to confiscate the property of nationals or ex-nationals in the United States would be given effect by U.S. courts.

Sovereign Immunity.—With the growing participation of governments and government departments or agencies in commercial affairs, private plaintiffs against such departments or agencies found themselves met by the plea of defendant's sovereign immunity from suit. The courts found some difficulty in knowing how to handle such cases, especially where not aided by an authoritative finding of sovereign immunity from suit by the department of state. The year 1941 presented numerous cases of that type. In a bondholder's suit against a Polish bank closely related to the Polish government which guaranteed its bonds, the state department was unwilling to assume responsibility for considering the bank a branch of the Polish state, whereupon immunity was denied. In another case where an attorney sued the Spanish state for unpaid fees for services rendered to the Loyalists, immunity was granted on the bare fact that a government was being sued. Circuit Judge Clark properly held no claim to immunity necessary where the facts clearly showed the defendant to be a foreign state. Executive or foreign government intervention to claim exemption from the jurisdiction seemed necessary only where the defendant's status as a government or government agency was unclear. In *Sullivan* v. *State of São Paulo*, 122 F. (2d) 355 (C.C.A., 2nd, 1941), Judge Clark went further, and, notwithstanding a somewhat equivocal avowal of the state department that the federal government of Brazil had manifested an interest in this suit of an American holder of defaulted São Paulo bonds, the court granted immunity on the ground that São Paulo was on a par with a state of the United States.

This immunity was more doubtful since São Paulo was not an international personality; but the matter was in much dispute in scientific circles.

In the "Uxmal," 40 F. Supp. 258, immunity was denied to a ship owned by the Yucatan sisal monopoly of the Mexican government, notwithstanding the ambassador's petition, because of an alleged waiver by the sisal association.

Foreign Bank Claims.—There were several cases where the branches of foreign banks in the United States were sued in the U.S. on claims held against the parent bank in Europe and the question in issue was the extent to which foreign exchange regulations and other state controls abroad operated in the United States as a bar to the plaintiff's relief.

Some courts at least gave effect to such regulations and controls if they operated internally on property abroad but declined to give them extra-territorial effect.

The unfairness of the rule that although unrecognized governments are not permitted to sue, nevertheless the statute of limitations is not tolled, so that the claim becomes outlawed, was again exemplified in a suit by the soviet government against the National City bank arising out of the notorious Cibrario transaction. (*See* also NEUTRALITY; PACIFISM.) (E. BD.)

International Trade.

The foreign trade of 22 countries for the first six months of 1940 and 1941 is shown in Table I. The list includes 7 European, 9 American, 3 Asiatic, 1 African and 2 Oceanic countries. The countries are ranged in descending order according to the dollar value of their total trade, imports and exports combined. The total in millions of United States currency dollars has been obtained by converting the amounts in original currencies at average rates of exchange. The totals in millions of the old gold dollars are shown for the purpose of comparison with the data published in previous years. The aggregate value of the trade of these 22 countries from Jan. 1 to June 30, 1941, was $8,698,570,000 currency as against $8,497,878,000 for the corresponding period of 1940, an increase of $200,692,000 or 2·4%. Of the countries listed, eight showed an increase of $765,830,000 in 1941, while the remaining 14 suffered a loss of $565,138,000. The foreign trade of the United States increased $322,038,000, and the trade of Canada $84,920,000; the increase for the other six countries amounting only to $158,872,000. The losses were largest for Argentina, Australia, Sweden, Rumania, Dutch East Indies and Switzerland.

Table I.—*Foreign Trade of 22 Countries*

For the first 6 months of 1940 and 1941 (in millions)

		1940	1941
United States	$	3,358	3,680
Canada	Can. $	1,044	1,358

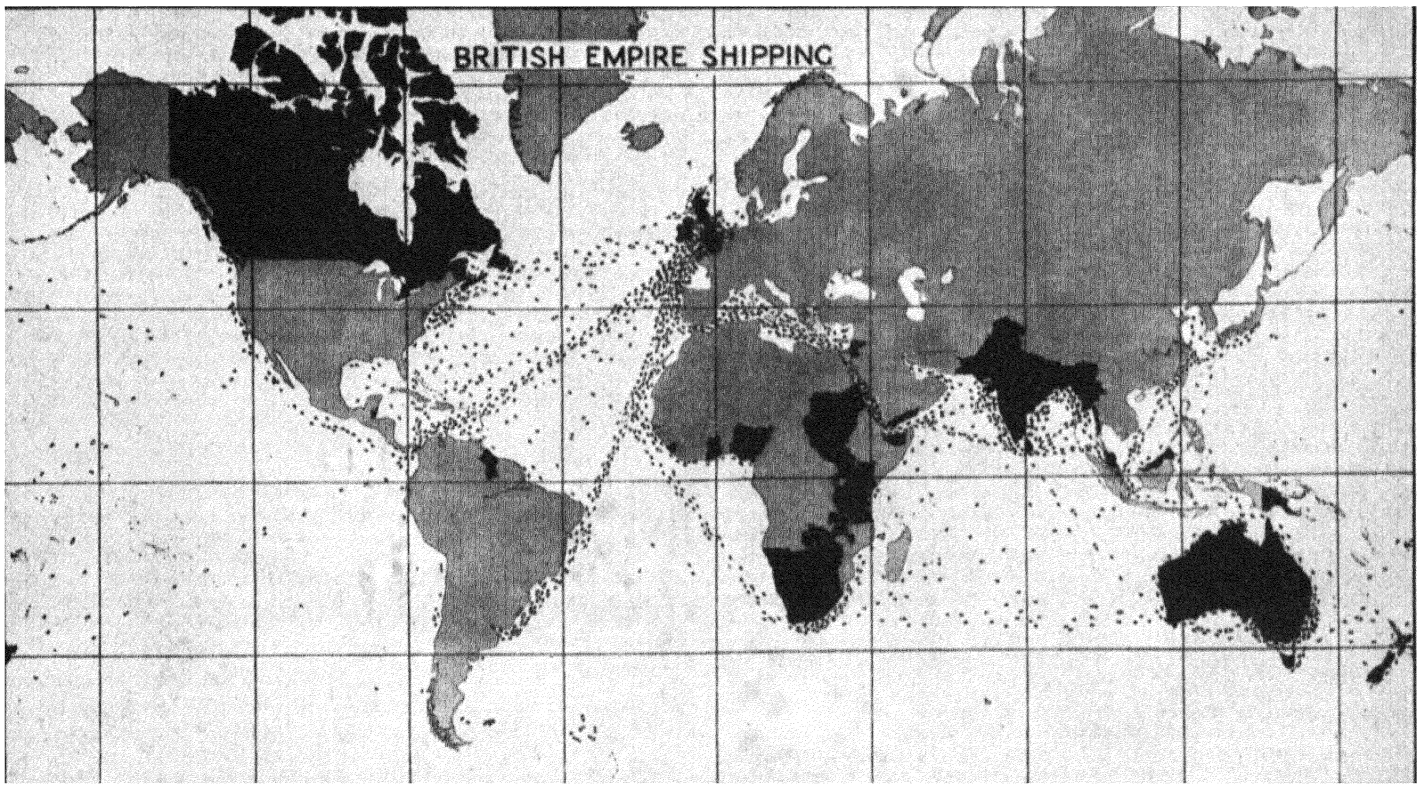
Haiti	gourdes	38	36
Total	currency $	8,498	8,699
Total	old gold $	5,019	5,138

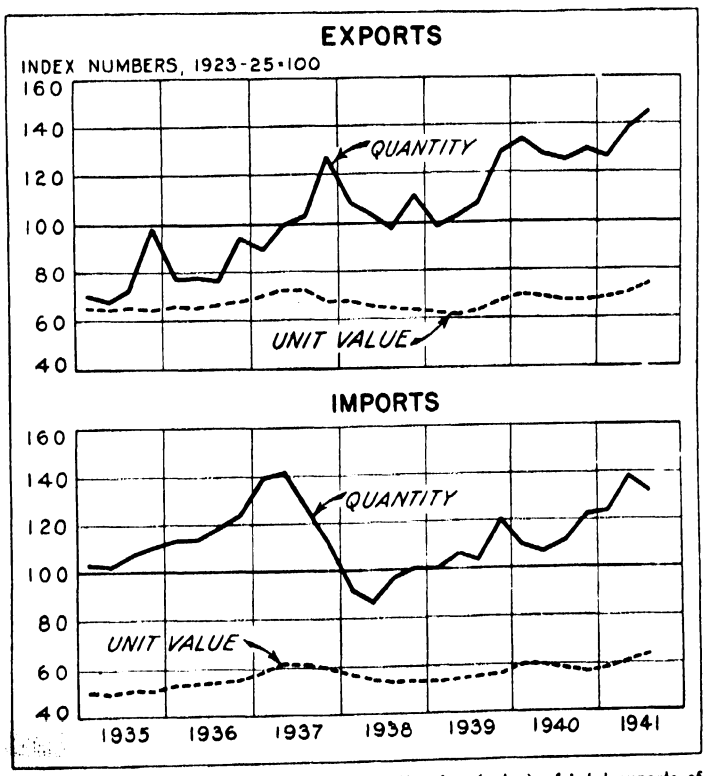
After June 1940 international trade was carried on only by the countries of the British empire, the 21 American republics, China, Japan and a few smaller countries that have preserved at least a shadow of independence. The year 1941 was a war year, and the volume of world trade was reduced still further as the countries overrun by Germany were eliminated from participation.

By lowering the standard of living the war threw new light on the social value of trade. A hundred years ago commodities like sugar, coffee, tea, cacao, rice, tapioca, oranges and lemons were still luxuries of the rich—by the end of the 19th century international trade made them necessaries of the poor as well as the rich. World War II, on the contrary, promoted not only the articles named, but even such important foods as butter and milk and numerous other commodities into the class of luxuries strictly rationed or not to be had at all, except in a black market at exorbitant prices. Golf balls are scarce in Germany, beer is rationed in Tokyo, nearly everything is rationed in Italy. Even before the war many countries had



DENSITY OF BRITISH TRAFFIC on the principal maritime routes of the world prior to the outbreak of war. Each dot represents a British ship at sea March 7, 1936, when all ships of 3,000 tons or more were required to report their positions to the admiralty in London. There were 1,462 on the high seas and 995 in inland or coastal waters, or in harbours. During 1941 much of the Mediterranean traffic to the east was detoured around Africa

sought to restrict the volume of foreign trade by high duties, preferences, quotas, currency measures and direct prohibitions. The intention may have been to protect national standards against foreign competition and achieve economic self-sufficiency, but the results were only a shrinkage of foreign trade and an increased cost of living. The war intensified these evils. It brought suffering to millions; it also demonstrated the need of liberal trading policies for the future. In the so-called Atlantic Charter of Aug. 14 Prime Minister Churchill of the United Kingdom and President Roosevelt of the United States proclaimed on behalf of their countries that they would endeavour, "with due respect for their existing obligations, to further the enjoyment by all states, great or small, victor or vanquished, of access, on equal terms, to the trade and to the raw materials of the world which are needed for their economic prosperity." And in a letter read before the National Foreign Trade convention in New York on Oct. 7, Pres. Roosevelt declared that "we must make sure that no effort will be spared to place international commerce on a basis of fair dealing, equality of treatment and mutual benefit. In no other way can it serve the function of promoting, rather than retarding, peaceful relations among nations and the economic well-being of all." Those were reassuring words, even though the promise of access to raw materials might be only a pointless concession to German propaganda. In peacetimes the Germans always could, and did, obtain all necessary raw materials on equal terms with others and occasionally at prices below the cost of production. By access to raw materials they really meant ownership or control of the country of production for the purposes of war. What the world needs are peace and co-operation toward greater freedom of trade rather than mere changes in the ownership of territory.



INDEXES OF CHANGES in quantity and unit value (price) of total exports of United States merchandise and imports for consumption, by quarters—1935-41. Prepared in the Bureau of Foreign and Domestic Commerce

United States.—Table II shows exports, imports and balance of trade of the United States.

Table II.—*Balance of Trade of U.S., 1929 and 1934-41*

(All figures in millions of dollars)

Year	Merchandise		Excess of exports (+) or imports (—)		
	Total Exports*	General Imports	Merchandise	Gold	Silver
1929	5,241	4,399	+ 842	— 175	+ 19
1934	2,133	1,655	+ 478	—1,134	— 86
1935	2,283	2,047	+ 235	—1,739	—336
1936	2,456	2,423	+ 33	—1,117	—171
1937	3,340	3,084	+ 265	—1,586	— 80
1938	3,094	1,960	+1,134	—1,974	—223

*Re-exports of imported merchandise are included.

The war had a profound influence on the foreign trade of the United States, particularly since America became the "arsenal of democracy" and undertook under the lend-lease act to supply means of defense to any nation fighting the aggressors, that is, the Berlin-Rome-Tokyo axis and its satellites. That resulted in numerous shifts among the principal countries of origin and destination as well as among the commodities imported and exported. In the first six months of 1939 the combined share of the 20 Latin American republics and the British empire countries in the trade of the United States was 57.8% in imports, 57.5% in exports and 57.6% in total trade. The war closed the European markets to Latin America and increased the dependence of the United Kingdom on American supplies, and in the first six months of 1940 and 1941 the share of those two groups of countries in U.S. trade increased to 61.5% and 78.2%, respectively. In

1941 Latin America supplied $499,740,000 or 31.3% of U.S. imports, as against $322,902,000 or 25% in 1940, and took $401,299,000 or 19.2% of U.S. exports, as compared with $378,454,000 or 18.3% in 1940. Imports from the countries of the British empire totalled $676,473,000 or 42.4% of total in 1941, as against $521,736,000 or 40.3% in 1940, while U.S. exports to those countries rose from $840,826,000 or 40.7% in 1940 to $1,299,296,000 or 62.3% of total in 1941. Imports from the United Kingdom declined from $78,300,000 to $66,162,000, while the imports from the British East Indies and Australia increased sharply, the latter due to the importation of 115,651,000 lb. of Australian wool in 1941 as against only 13,649,000 lb. in 1940. Exports to the United Kingdom rose from $358,861,000 in 1940 to $623,419,000 in 1941.

War caused large increases in the imports of raw materials and the exports of finished manufactures. United States imports for consumption for the first eight months of 1941 were valued at $2,050,453,000, as against $1,675,921,000 in 1940, an increase of $374,532,000 or 22.3%. There was a decline of $11,552,000 in the imports of finished manufactures, chiefly leather and textiles, but increases in all other classes: in raw materials (wool, rubber, ores, hides, furs, petroleum, cotton), foodstuffs (coffee, cacao, sugar), and semimanufactures (copper, tin, lumber). Exports of U.S. merchandise totalled $2,830,625,000 for the first eight months of 1941, as against $2,673,117,000 in 1940, an increase of $157,508,000 or 5.9%. Exports of finished manufactures increased $430,127,000 to a total of $1,955,423,000, the principal exports being aircraft, industrial machinery, iron and steel, firearms and ammunition, electric machinery, motor trucks and cotton manufactures. There was an increase of $45,093,000 in the exports of manufactured foodstuffs (meats, dairy products), but exports of crude materials declined $173,104,000, crude foodstuffs $12,664,000, and semimanufactures $131,944,000. Exports of raw cotton went down from 1,753,633,000 to 311,952,000 lb., the value declining from $183,601,000 to $36,640,000.

In the second year of the war ending Aug. 31, 1941, finished manufactures valued at $2,760,000,000 represented 66% of total U.S. exports, the value showing an increase of $627,000,000 or 29% over the first year of the war and 78% over the year ended Aug. 1939. The exports of aircraft more than doubled in value, advancing from $246,000,000 in the first year of the war to $492,000,000, while munitions, firearms and explosives nearly tripled, increasing from $62,000,000 to $173,000,000. (*See* also BUSINESS REVIEW: *U.S. Foreign Trade.*)

United Kingdom.—British imports for the calendar year 1940, valued at £1,099,868,877, showed an increase of £214,356,375 or 24.2% over 1939, while exports of British goods declined from £439,535,710 to £413,084,205, or 6%, and re-exports of foreign merchandise went down 41.1%, from £46,033,592 to £26,188,957. No official trade reports were published for 1941, but the indications were that imports increased, while strenuous efforts were being made to maintain a steady flow of exports, even though on a slightly reduced scale.

Table III.—*Foreign Trade Values in United Kingdom*

Year	Total Imports (£1,000)	Exports of United Kingdom Goods (£1,000)	Exports of Imported Merchandise (£1,000)
1929	1,220,765	729,349	100,702
1934	731,414	395,986	51,243
1935	756,037	425,921	55,266
1936	847,752	440,605	60,769
1937	1,027,824	521,391	75,134
1938	910,500	470,755	61,525
1939	885,512	439,536	46,034
1940	1,000,869	413,084	26,189

Germany.—More than 18 centuries ago Tacitus noted that the Germans fought for booty, the Gauls for liberty (*Germanos ad praedam, Gallos pro libertate*). They still did. Although no official reports on the foreign trade of Germany have been issued since July 1939, it was certain that both the volume and the value of the trade declined in 1940 and still further in 1941, since Germany had invented an "ersatz" or substitute for foreign trade. That ersatz is loot. Countless carloads of flour, butter, meat, other foodstuffs, raw materials, oil, machines, implements of war, even fences, doorknobs and scrap, were transported to Germany after every invasion. Surpluses of material goods could be looted only once, however, and so the Germans looted also the labour power of the subjugated nations by transporting more than 2,000,000 men and women to German farms and factories and enslaving other millions in their own homes. In the subjugated countries the Germans also confiscated or nominally purchased with worthless paper money numerous industrial and commercial establishments, including their foreign branches. In Argentina alone, according to a parliamentary investigation, the Germans thus gained control of approximately $455,000,000 worth of business and industry.

Other Countries.—The foreign trade of Canada for the first eight months of 1941 totalled $1,952,616,000 (Canadian) as against $1,448,967,000 in 1940, an increase of 34.8%. Imports for consumption valued at $910,905,000 in 1941 had increased 33.5%; exports of Canadian goods, valued at $1,029,991,000, showed an increase of 35.6%. In 1941, as in 1940, countries of the British empire supplied over 25% of Canadian imports and took over 56% of Canadian exports, but there were notable shifts among the several countries. In the trade with the United Kingdom imports declined $5,877,000, while exports increased $112,830,000 to a total of $449,245,000. United States share in Canadian trade declined from 36.5% to 35.5% in exports and rose from 67.9% to 68.9% in imports. The remarkable increase from $595,000 to $44,670,000 in the exports to Egypt was due to shipments of war materials to the near east.

Argentina exported 3,170,967 metric tons of goods valued at 730,446,000 pesos in the first six months of 1941, as against 6,370,007 tons valued at 925,012,000 pesos in 1940. The quantity exported was the lowest in the past decade. Exports of maize went down from 1,352,960 to 279,227 tons; exports of wheat from 2,287,195 to 1,301,801 tons. Decreases were noted also in the exports of linseed, barley, wheat flour, seeds and oilseed cakes. Exports of wool increased from 79,175 to 121,638 metric tons, and exports of cotton from 10,497 to 24,649 tons, while the quantities of meats and hides exported showed but little change. The war had closed most of the European markets to Argentina and raised the importance of the American markets. In the first nine months of 1941 Argentina exported to the continental United States goods valued at $129,867,000, a value greater than the exports for the whole year 1929 which had been a record, and an increase of 139% over the first nine months of 1940. The trade would doubtless increase further under the agreement between Argentina and the United States concluded in the fall of 1941.

Brazilian exports for the first six months of 1941 totalled 1,695,832 metric tons valued at 3,085,509 contos of reis, an increase of 7.3% in quantity and 15.1% in value over the first six months of 1940. Exports to the United States increased from 932,032 to 1,685,155 contos, and exports to other American countries from 249,010 to 500,252 contos, while exports to European countries declined from 1,241,746 to 534,026 contos, the United Kingdom taking 374,006 contos in 1941 as against 540,287 contos in 1940. The exports of coffee increased from 6,474,538 to 6,880,605 bags of 60 kilos, the United States alone taking 6,041,173 bags in 1941, as against 4,027,883 bags in 1940. In the last three half-yearly periods exports of coffee to France were 764,808 bags in 1939, 864,898 bags in 1940 and 15 bags in 1941, while exports to Germany decreased from 790,255 bags in 1939 to 63,188 in 1940 and 124 in 1941. Brazilian imports for the first six months of 1941 totalled 1,761,684 metric tons valued at 2,363,840 contos of reis, a decline of 21.1% in quantity and 14.5% in value. Imports from the United States went up from 1,352,071 to 1,389,369 contos, while imports from European countries declined from 717,896 to 352,825 contos. Imports from Japan increased from 63,117 to 68,356 contos.

In the trade of Cuba for the first six months of 1940 and 1941 imports from the United States increased from 74.2% to 87.6% of total, while imports from Europe declined from 12.7% to 4.3%. Exports to the United States went up from 80.2% to 92.5%; exports to Europe declined from 17.2% to 3.6%. Trade with the United Kingdom declined from 8,659,000 to 3,895,000 pesos.

The value of the foreign trade of Iceland for the first seven months of 1940 and 1941 increased from 35,430,000 to 59,763,000 crowns in imports, and from 53,042,000 to 110,991,000 in exports. In 1941 the United Kingdom supplied 64.9% of imports and took 84.6% of exports. The country exported 78,901 metric tons of fresh and frozen fish in 1941 as compared with 59,231 tons in 1940, the value rising from 27,377,000 to 73,314,000 crowns.

In the first six months of 1941 China imported 528,313 metric tons of rice and 280,355 tons of wheat flour, as compared with 337,216 and 100,877 tons respectively, in 1940.

New Zealand trade for the first six months of 1940 and 1941, expressed in New Zealand pounds sterling, declined from £24,869,580 to £22,056,878 in imports and from £44,631,839 to £36,657,236 in exports. The increase in the exports of dairy products was not sufficient to make up the loss in th exports of meats and wool. The exports of wool declined from 715,475 bales valued at £13,296,951 in 1940 to 416,372 bales valued at £8,030,917 in 1941.

France, Germany, Italy, Japan, the U.S.S.R. and the United Kingdom did not issue any trade reports for 1941. (*See* also AGRICULTURE; TRADE AGREEMENTS.)

(J. J. K.)

Interstate Commerce Commission.

The interstate commerce commission, created Feb. 4, 1887, for the regulation of carriers engaged in interstate commerce, consists of 11 members appointed by the president. From its membership the commission selects its chairman (Joseph B. Eastman in 1941).

Like most of the agencies of the government in 1941, the interstate commerce commission was involved to a considerable extent with the defense program. It co-operated with Ralph Budd, transportation commissioner under the Office for Emergency Management (*q.v.*), in transportation matters related to defense.

The railroads, which, as in preceding years, continued to carry the greater part of the nation's freight, were called upon to handle additional traffic resulting from the movement of defense materials in 1941. To aid them in securing maximum use of their facilities, the interstate commerce commission expanded its bureau of service, originally established some 20 years before.

Likewise the interstate commerce commission had a part in the effort to promote the most effective use of motor transportation in 1941 through the organization of central and regional motor transportation committees. One of the commissioners served as chairman of the central committee, and the chairmen of the 16 regional committees were field officials of its bureau of motor carriers. Because of the diversion of tank vessels to Great Britain in 1941 and other reasons, pipe-line transportation of petroleum increased in importance. The interstate commerce commission was accordingly concerned with additional regulatory problems in-

volving pipe lines.

One of the most important accomplishments of the interstate commerce commission in 1941 was the completion of an exhaustive report to congress on the question of federal regulation of the sizes and weights of motor vehicles. Such regulation was favoured by many motor-carrier operators, who complained of the inconvenience caused by the diversity of limitations on size and weight under statutes of certain states. Federal legislation on this subject, however, was opposed by many state officials on the ground that it would be an invasion of state sovereignty.

The commission organized a bureau of water carriers in 1941 as its principal instrumentality in administering the water-carrier regulation provided in the Transportation act of 1940.

Intestinal Disorders: *see* ALIMENTARY SYSTEM, DISORDERS OF.

Intoxication, Alcoholic. A symposium dealing with the scientific description and control of individual and social problems of alcoholism was held at Philadelphia, Pa., on Dec. 27–29, 1940.

The medical, public health, sociological and economic significance of the alcohol problem continued to be obscured by its moral, profit and revenue motivations. It was obscured also by a lack of exact knowledge concerning its magnitude; where, when and under what conditions it occurs, and by no little controversy as to its exact nature. Chronic alcoholism was said to be increasing. The number of local communities which by popular vote have exercised their option to prohibit licences for the sale of alcoholic beverages increased.

Early in World War I, France instituted strict measures for the control of alcoholism with material success in reducing its incidence. It was realized at that time that alcoholism would help in part to generate civil and military panic. In Aug. 1938, a time of political unrest in Paris, alcoholism almost doubled, later returning to its usual incidence. Again in Aug. 1939, under pressure of national distress, alcoholism increased 186%. For a time thereafter war was nearly forgotten, and the usual situation respecting alcoholism obtained until May 1940 when the German offensive began. Defeat and evacuation pushed alcoholism and drunkenness to its former peak, and only then did the government of Paris tardily invoke measures for its control.

In a more specific sense the literature on acute alcoholic intoxication dealt, in large measure, with methods and means for its diagnosis with particular reference to the enforcement of motor vehicle traffic laws and the admissibility of evidence based upon the results of chemical tests for alcohol in body fluids. One state supreme court confirmed a previous conviction in a lower court, wherein the defendant in his appeal, plead that the results of chemical tests for alcohol in his body fluids compelled him to be a witness against himself. Other contributions, based on the application of special laboratory tests of skill, claimed that blood alcohol concentration alone is not an accurate index of the degree of "drunkenness."

In the field of treatment for chronic alcoholism, the uses of hypertonic sodium chloride solution intravenously was advocated for delirium tremens and alcoholic hallucinosis. It was claimed that it reduces the incidence of lobar pneumonia in these cases. The use of the principles of the conditioned reflex as a therapeutic measure in chronic alcoholism was again revived. In the treatment of alcoholic polyneuritis intensive vitamin therapy seemed to offer little advantage over that of foods rich in natural vitamin content.

The so-called depravity of chronic drinkers is but a part of a disturbed functioning of a personality. The mosaic of their experiences in infancy, childhood and adolescence is often misevaluated or misinterpreted by them, or is given false or incorrect emotional values that are carried over into maturity.

Most of them have never had that confident feeling of being at home in the world, or that their environment and associates are satisfying and that the world is an interesting and dramatic place in which to live. Their dependence on others, their lack of assurance in being a person, their self condemnation and self pity are proverbial. The confidence inspired by an understanding appreciation of their difficulties through the medium of one or several persons has in some instances resulted in their reclamation.

The "Alcoholics Anonymous" movement composed of an experienced group has served in some instances as a prop on which the unfortunate alcoholic may temporarily lean and through group encouragement and mutual understanding take his place and do his part among his fellows. (*See* also PSYCHIATRY: *Alcoholism.*)

Iodine. The production of iodine in the United States has not been reported since 1937, when it was 299,286 lb., but it is known to have increased each succeeding year. Imports from Chile increased heavily in 1940 to 1,244,181 lb., and the valuation of the imports increased from 84 cents per lb. in 1939 to $1.04 in 1940. The Chilean production was expected to exceed 1,000 metric tons in 1940, and sales for the fiscal year ending July 30, 1940, were 1,247 tons. Japan has an output of about 100 tons and Italy one of 25–30 tons annually, but no recent data are available. (G. A. Ro.)

Iowa. A north central state of the United States, admitted as the 29th state on Dec. 28, 1846; popularly known as the "Hawkeye state." Area, 56,280 sq.mi.; pop. (1940) 2,538,268. The urban population was 1,084,231; rural was 1,454,037, of which 916,768 lived on farms. Of the total population, 2,403,446 were native whites, 117,245 foreign-born whites, 16,694 Negroes and 883 belonged to other races. Capital, Des Moines (159,819). Other principal cities are Sioux City (82,364), Davenport (66,039), Cedar Rapids (62,120), Waterloo (51,743) and Dubuque (43,892).

History.—The officers elected on Nov. 5, 1940, who took office in Jan. 1941, were: governor, George A. Wilson; lieut. gov., B. B. Hickenlooper; auditor, C. B. Akers; treasurer, W. G. C. Bagley; secretary of state, Earl G. Miller; secretary of agriculture, Mark G. Thornburg; attorney general, John M. Rankin; and superintendent of public instruction, Jessie M. Parker. All were Republicans, and all except the attorney general were serving second terms.

Education.—For the school year 1940–41, the total number of children in Iowa of school age (5–21 years) was 676,262, of whom 358,527 were enrolled in public elementary schools, 137,646 in public high schools and 2,489 in public junior colleges. The total expenditure for public schools by school districts was $47,111,774.11, $42,567,613.51 of which was raised by a general property tax in local districts. The illiteracy rate in Iowa was .8 of 1%. (*See* IOWA, STATE UNIVERSITY OF; IOWA STATE COLLEGE.)

Public Welfare, Charities, Correction.—A state board of social welfare, composed of three members appointed by the governor (King R. Palmer, chairman in 1941), administers old-age assistance, aid to the blind, aid to dependent children, child welfare and state grants for relief. Working with it in 1941 were local social welfare boards in the 99 counties. For the year 1941–42, the state appropriated $8,500,000 for old-age pensions, $500,000 for state emergency relief, and $260,000 for child welfare and aid to the blind. General relief and mothers' pensions were handled by the county authorities.

The full-time board of control, with three members appointed by the governor (P. F. Hopkins, chairman in 1941), had charge of the state's penal, correctional and eleemosynary institutions.

Finance and Banking.—Taxable property in Iowa on Jan. 3, 1941, was estimated at $3,000,000,000. The income of the state government for 1940–41 included $5,015,238 from the general property tax and some $52,057,012 from taxes on cigarettes, gasoline, incomes, retail sales and other special taxes. There were 103 national banks, 297 savings banks, 246 state banks, 1 trust company and 59 building and loan associations in Iowa in 1941. The report for June 30, 1941, showed total deposits of $288,242,000 in the national banks and total resources of $315,453,000. The deposits in the 544 state banks, savings banks and trust companies chartered by the state, as of Sept. 24, 1941, totalled $493,757,235; resources were $546,203,125.

Communication.—The state highway commission, Ames, has charge of all primary roads in the state. By July 1, 1941, 5,364 mi. of primary roads of Iowa were paved and 3,139 mi. were gravelled or otherwise surfaced. On the secondary road system 41,682.2 mi. were gravelled. For the fiscal year 1940–41 construction work on primary roads cost the state $8,003,143.16. Counties spent $7,435,921.34 for construction work on secondary roads. For the year 1939–40 the state spent $4,560,040 on farm-to-market roads, $2,060,040 of which was federal funds. There were 9,017 mi. of steam railways in 1940. Motor carriers for the year 1939 reported 113,532,622 passenger miles. Regular air service crosses the state with airports at Iowa City and Des Moines. Iowa had approximately one telephone for every five persons in 1941.

Agriculture.—There were 211,500 farms in Iowa in 1941 with 34,637,990 acres. Crops were good in 1941, although lack of moisture affected the production in some areas. The total value of agricultural production in 1941 from the 20,580,000 acres harvested was estimated at $471,710,000. In the first nine months of 1941, Iowa farmers received a cash income of $617,734,000, of which $503,673,000 came from livestock, $105,111,000 from crops, and $8,950,000 from government payments.

Table I.—*Leading Agricultural Products of Iowa, 1941 and 1940*

Crop	1941	1940
Corn, bu.	464,814,000	473,760,000
Oats, bu.	177,280,000	199,353,000
Hay, tame, tons	5,581,000	6,350,000
Soybeans (grain), bu.	16,608,000	14,180,000
Soybeans (hay), tons*	516,000	1,227,000
Barley, bu.	6,930,000	12,870,000
Wheat, bu.	2,943,000	7,603,000
Potatoes, bu.	5,712,000	5,700,000
Rye, bu.	270,000	684,000

*Included in the figures for tame hay.

Manufacturing.—The total value of products manufactured in Iowa in 1939 was $718,531,801. There were 2,670 manufacturing establishments with 11,501 salaried employees who received $23,535,779 and 65,314 wage earners who received $73,466,119. Meat packing headed the list of Iowa industries, employing about one-sixth of the wage earners. The products were valued at $257,314,633. Second in value was buttermaking, with a product valued at $60,380,974.

Mineral Production.—Iowa ranked 29th among the states in importance of minerals in 1939; the total value of such products in that year was $25,483,936. Most important products were cement, coal, stone and gypsum.

Table II.—*Principal Mineral Products of Iowa, 1939 and 1938*

	Value, 1939	Value, 1938
Cement	$7,771,503	$7,327,048
Coal	7,503,000	7,963,000
Gypsum	510,120	495,856
Sand and gravel	1,299,449	2,299,682
Stone	4,385,234	3,782,480

(R. A. GA.)

Iowa, State University of.

An institution of higher learning at Iowa City, Ia., established Feb. 25, 1847 by Iowa's first general assembly. It was the first state university to admit women on equal standing with men.

A new all-time enrolment record for the 12 months ending in June 1941 was set at 10,820, marking the sixth time that the 10,000 mark had been passed. Most of the gain was accounted for by the record Sept. 1940–June 1941 enrolment of 7,185. The university granted 1,764 degrees, second highest total in its history. The 651 degrees awarded by the graduate college constituted a record. Virgil M. Hancher was inaugurated in May as the 13th regular president. An addition was built to provide added facilities for the university theatre. More than 1,000 persons were taught in about 40 national defense courses by the college of engineering. A staff of 669 persons gave instruction in the nine colleges and five schools. (E. C. W.)

Iowa State College.

An institution of higher learning at Ames, Ia. Like other land-grant colleges and universities, Iowa State college during 1941 geared its activities to national defense in agriculture, engineering, home economics, science and veterinary medicine. About 750 nonstudents were trained both on and off the campus in engineering defense courses. More than 100 students completed aviation work in the civilian pilot training program. The college took an active part through its extension service in citizenship and democracy training and in the "food for freedom" speeding up of agricultural production, including a campaign for improvement of nutrition of residents of the state. Construction of a new men's dormitory to house 450 students was started and 1½ mi. of campus drives were paved. Instruction in aeronautical engineering was given the status of a full four-year curriculum. The graduate college celebrated the 25th anniversary of its founding. In the year ending in June 1941, resident enrolment in Iowa State college reached a new high of 8,104 students, including 2,619 women and 1,119 graduate students. (R. W. BE.)

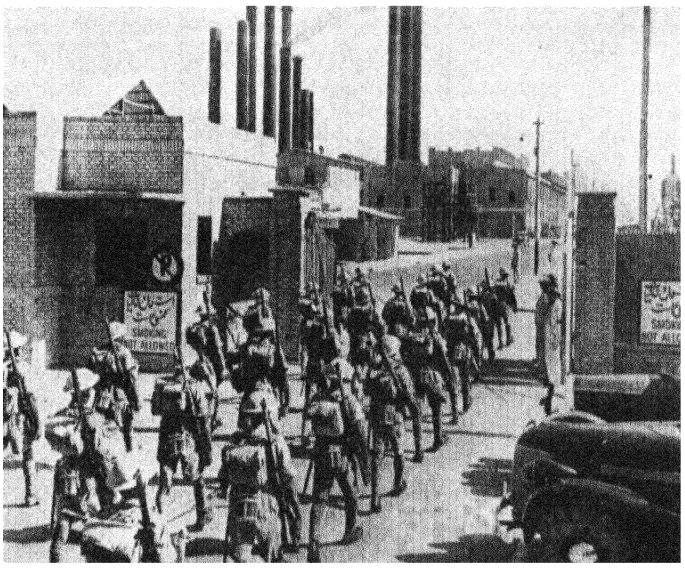
Iran.

Known before March 1935 as Persia, Iran is a country of western Asia bounded to the east by India and Afghanistan, to the north by the U.S.S.R., to the west by Iraq and Turkey, and to the southwest and south by the Persian gulf and Arabian sea; ruled since 1926 as a constitutional kingdom. Ruler: Shah Mohammed Reza; premier, Mohammed Ali Feroughi. Area, *c.* 628,000 sq.mi.; pop. (est.), 15,000,000. Chief towns: Tehran (cap., 360,000), Tabriz (220,000), Meshed (140,000), Shiraz (120,000), Isfahan (100,000). Language, Persian; religion, Mohammedan.

History.—German attempts to create a fifth column and to secure dominating influence in Iran continued in 1941 to jeopardize British and Allied interests in the middle east. A steady infiltration of nazi agents in the guise of "tourists" increased the German colony to between 2,000 and 3,000 and provoked representations from the British government, who urged that Iran's neutrality was being compromised. Earlier warnings having been ignored, following the invasion of the U.S.S.R., Sir Reader Bullard, British minister in Tehran, on July 16 made further emphatic approaches to the Iranian government concerning the situation, and similar action was taken by the soviet minister. The government undertook to reduce drastically the number of Germans resident in the country, but the position was virtually unchanged up to Aug. 16, when the British and soviet ministers again made representations.

As the Iranian government showed no signs of fulfilling their undertaking, British and Russian forces crossed the frontiers of Iran early in the morning of Aug. 25 to safeguard Allied interests. Some slight resistance was offered, but the premier, Ali Mansur, resigned on Aug. 27 and hostilities ceased after the formation of a new government under Ali Feroughi.

Pending a definitive agreement, the occupying forces continued their advance. On Sept. 10 the government accepted the Anglo-soviet terms, which included the closing of the German, Italian, Hungarian and Rumanian legations, the surrender of enemy nationals, and provision of facilities for war transport to the U.S.S.R. Delay in implementing the second of these conditions drew from Moscow an accusation that a policy of obstructionism was being fostered by the shah, Reza Pahlevi. Rising internal



INDIAN RIFLEMEN marching into the huge petroleum refinery on the island of Aradian, in the Persian gulf, during the Anglo-Russian invasion of Iran in 1941.

discontent, aggravated by acute food shortages, led to the abdication of the shah on Sept. 16 in favour of his 21-year-old son, Mohammed Reza Pahlevi (*q.v.*). Ali Feroughi reorganized his cabinet, diplomatic relations with the axis and with Bucharest were broken off, and the new government laid down a program of progressive reform and collaboration with powers whose interests were associated with their own. Upon demands by certain deputies for the trial of the ex-shah on charges concerning his income and the alleged disappearance of some of the crown jewels, he was found to have fled, and Oct. 18 it was stated that he had arrived at Mauritius.

On Oct. 19 the Anglo-Russian forces withdrew from Tehran to agreed positions. In November it was announced that British and U.S. missions would shortly be sent to Iran to speed up supplies to the U.S.S.R., and news was given of the opening of a new supply route from India to the U.S.S.R. via Baluchistan and Iran. At the close of the year vast quantities of war material were arriving in Iranian ports from all parts of the British empire. (*See* also WORLD WAR II.) (D. A. C.)

Education.—(1937): 4,939 schools; 273,600 scholars; one university at Tehran.

Banking and Finance.—Revenue, ordinary (est. 1940–41) 3,095,000,000 rials; expenditure (est. 1940–41) 3,211,000,000 rials; foreign loan (May 15, 1940) £951,706; public debt (Dec. 31, 1938) 98,900,000 rials; note circulation (Aug. 31, 1940) 1,046,000,000 rials; gold reserve (Aug. 31, 1940) 310,949,000 rials; exchange rate (average 1940) 1 rial=5.882 cents U.S.; (Sept. 29, 1941) 1 rial=2.857 cents U.S.

Trade and Communication.—Foreign trade (merchandise) 1938–39: imports 1,072,700,000 rials; exports 2,501,300,000 rials. Communications 1938: roads fit for wheeled traffic, *c.* 8,700 mi.; railways open to traffic, 1,072 mi.

Agriculture and Mineral Production. Production, 1937–38 (in metric tons): petroleum, crude (1939) 10,367,000; wheat 1,942,300; barley, 706,900; rice, 382,100; cotton, 32,900; wool (1938) 18,100; beet sugar (1939–40) 25,200; tobacco 15,900.

Iraq, an Arab state of the near east, between Iran, Syria and Arabia, watered by the Tigris and Euphrates; an independent kingdom since 1932, when the British mandate was terminated. Area, 116,000 sq.mi.; pop. (census Oct. 1934) 3,561,000 (est. Dec. 31, 1938), 3,700,000. Chief towns: Baghdad (capital, 400,000), Mosul (260,000), Basra (180,000). Ruler: King Feisal II; regent: Prince Abdul-Ilah; premier: General Nuri es Said; language: Arabic; religion: Mohammedan.

History.—After a cabinet crisis at the end of January Rashid Ali el-Gailani resigned and was replaced as prime minister by Taha Hashimi, during whose short term of office Sir Kinahan Cornwallis was appointed British ambassador. In April a coup d'état, organized by Rashid Ali and several army leaders and supported by axis agents and by the Palestinian Arab exiles led by the Mufti of Jerusalem, resulted in the establishment of a "government of national defense" under Rashid Ali. The regent fled to Basra, and thence to Trans-Jordan, where he was joined by Nuri es Said, Jamil Midfai and others; he was replaced as regent by the Sharif Sharaf, elected by a rump parliament. The new prime minister pledged himself to observe the Anglo-Iraqi treaty, and when imperial troops landed in Basra "to open up communications," the Iraqi government provided facilities for them. But when, at the beginning of May, fresh contingents were landed, the Iraqi government declared this to be an infringement of the treaty, and fighting broke out near the British air base at Habbaniya. Main incidents of the Anglo-Iraqi conflict were the occupation of Basra by imperial troops, the unsuccessful attack upon Habbaniya by the Iraqi army, the successful attacks by the R.A.F. upon Iraqi airfields at Baghdad and elsewhere, the fighting in the desert around Rutbah, and, finally, the occupation of Baghdad by imperial troops at the beginning of June.

Rashid Ali and his associates fled to Iran. The occupation of Baghdad was followed by an armistice, and the return of the regent to the capital. The policy of the new ministry formed by Jamil Midfai was to fulfil the terms of the Anglo-Iraqi treaty; relations with Italy, and subsequently with Japan and Vichy France, were broken off, and the government did its best to co-operate with the British authorities. This policy was made easier by Anthony Eden's statement, in a message to the Iraqi foreign minister in June, that the British government respected the independence and integrity of Iraq, and were ready to co-operate in measures for its defense and prosperity. The interest of the new ministry in the pan-Arab cause was shown by the appointment of Nuri es Said as minister in Cairo.

In internal affairs attention was mainly devoted to undoing the work of Rashid Ali's regime. The actions of his government were declared invalid, and courts-martial were set up to punish the ringleaders of the coup. Rashid Ali and others escaped to Turkey and Europe.

In October bad health compelled the prime minister to resign, and he was succeeded by Nuri es Said. (A. H. Ho.)

Education.—In 1938: elementary schools, government, 741; scholars, 94,368; new schools opened 1938–39, 22; secondary schools, 14; scholars 1,904; intermediate schools, 48; scholars 10,611.

Finance. Revenue, ordinary (est. 1940–41), 6,400,000 dinars; expenditure, ordinary (est. 1940–41), 6,700,000 dinars; public debt (Dec. 31, 1938) 98,900,000 dinars; notes in circulation (Feb. 28, 1941), 5,900,000 dinars; foreign assets reserves (Nov. 1940), 6,800,000 dinars; exchange rate 1941 (currency based on sterling): 1 dinar=£1 sterling=403.5 cents.

Trade and Communication.—Foreign trade 1939 (merchandise): imports, 8,156,179 dinars; exports, domestic (excluding crude petroleum) 3,759,401 dinars. Communications: roads open to traffic (1940) *c.* 4,000 mi.; railways, open to traffic (June 1940) 947 mi.

Agriculture and Minerals. Production 1938 (in metric tons): petroleum, crude (1939), 4,116,000; wheat, 600,000; rice, 360,000; barley, 1,138,400; tobacco, 4,000; wool, 8,300; cotton, 2,600; cotton seed, 6,200.

Ireland: *see* EIRE.

Ireland, Northern. Northern Ireland comprises the six Ulster counties of Antrim, Armagh, Down, Fermanagh, Londonderry and Tyrone, forms part of the United Kingdom of Great Britain, but (since 1920) has its own parliament and executive, though also represented in the imperial parliament by 13 members. Area, 5,238 sq.mi.; pop. (June 30, 1938), 1,285,000. Chief cities (pop. census 1937): Belfast (cap., 438,086), Londonderry (47,813). Language: English; religion: Christian (Roman Catholic, 33·75%; Presbyterian, 31·4%; Episcopalian, 27%). Ruler and national flag, as for Great Britain. Gov.: the duke of Abercorn; premier: John Miller Andrews.

History.—Abnormal conditions created by World War II profoundly affected the life of Northern Ireland during 1941. Parlia-

ment was occupied with legislation dealing with a variety of wartime problems—some of them arising directly out of enemy action.

The administrative responsibility for war production in Northern Ireland was transferred to the ministry of commerce, acting as agent for the government departments concerned in London. A campaign to accelerate industrial output for war purposes was inaugurated with the support of employers and workpeople. Hutments were provided on the outskirts of the chief industrial area, for war workers whose families had removed to safety zones in the country. Thousands of women and children, and aged, blind and infirm persons were evacuated from Belfast to small provincial towns and rural districts. This upheaval of the normal life of the community produced its own problems, but the evacuees gradually adapted themselves. Experience gained in the air raids of April and May was put to good account, especially in the better equipment of the fire-fighting services. In Belfast, the civil defense authority expanded and improved its organization, especially in the provision of rest centres, emergency feeding facilities, casualty information bureaus and mobile food canteens, some provided through the generosity of the American Red Cross.

Food rationing in Northern Ireland was the same as in Great Britain. All surplus food went into the national "pool" for the feeding of the people of England, Scotland and Wales. Thousands of fat cattle and hundreds of tons of bacon and ham were sent weekly to Great Britain; the year's total of eggs shipped ran into hundreds of millions.

In the 1941 budget, introduced on April 29, 1941, provision was made for a contribution of £11,750,000 to the imperial exchequer, compared with £6,000,000 in 1940. Expenditure on war services was estimated at more than £3,000,000. Special war expenditure is refunded to Northern Ireland by the imperial exchequer. Taxation levied by the imperial parliament applies to Northern Ireland, in common with the rest of the United Kingdom. War savings in Northern Ireland amounted at the end of August to well over £24,000,000.

Lord Craigavon, who died in Nov. 1940, was succeeded in the premiership by J. M. Andrews, whose place as minister of finance was taken by J. Milne Barbour. Sir Basil Brooke became minister of commerce, and Lord Glentoran became minister of agriculture. Government policy remained unchanged. (R. D. B.)

Education.—In 1938: elementary schools, 1,700; scholars, 191,862; secondary schools, 76; scholars, 14,557; universities, students, 1,590.

Finance.—Revenue (1940–41), £23,766,644; expenditure (including £6,000,000 imperial contribution and £80,624 surplus of revenue) £23,766,644; 1941–42, estimated revenue £23,533,000; estimated expenditure £19,066,000; exchange rate 1941: £1=403.5 cents U.S.

Trade and Communication.—External trade 1938: imports £54,385,000; exports, £51,061,000. Communications 1939: roads fit for motor traffic, 13,043 mi.; railways, standard gauge, 741 mi., narrow gauge, 121 mi.; canals, 180 mi.

Agriculture and Manufacturing.—Production 1938 (in tons): potatoes, 491,000; oats, 22,700; wheat, 3,850; flax, 4,036; barley, 1,025. Livestock (1939): cattle, 700,564 head; sheep, 551,262 head; pigs, 565,726 head; poultry, number, 6,038,000. Flax acreage (1941) 90,000 (40,000 in 1940); additional grassland ploughed (1941) 250,000 acres. Agricultural statistics taken in June 1941 showed an increase in the crop-bearing area of almost 10% over the previous year and of 32% over 1939. The flax acreage was 93.6% greater than in 1940. Shipbuilding, tonnage launched (1938), 79,468; value of linen goods exported 1938, £5,480,000. (*See* also GREAT BRITAIN AND NORTHERN IRELAND: *History.*)

Irish Free State: *see* EIRE.

Iron and Steel.

Discussion of the iron and steel industry can for the most part be handled more satisfactorily subdivided into its three main headings—iron ore, pig iron and steel. Production tables under each of these headings include all countries in which production of the commodity in question has materially exceeded 1,000,000 tons, giving a coverage which in general accounts for 93–98% of the world totals. Production data having been suppressed since Sept. 1939 in most countries outside of the United States and Canada, such

IRON ORE SHIPMENTS began to move through the Great Lakes from Minnesota April 9, 1941, as the U.S. government, anxious to increase production of steel for defense, made an extra appropriation of $97,000 for ice-breaking

later figures as are presented are estimates.

Iron Ore.—Data on iron ore production had been so scarce since 1938 that no totals could be estimated in 1941, but if it is assumed that ore production had kept pace with pig iron output a rough approximation would be 200,000,000 metric tons for the world total in 1939, and 208,000,000 tons for 1940.

In the United States the 1940 output was 73,695,000 long tons, only 2% less than the high point of World War I. Shipments from the mines were 75,198,100 tons, of which 62,921,000 tons were from the Lake Superior district. Lake shipments in 1941 were estimated at more than 81,000,000 tons, and ore consumption for the year was about 75,000,000 tons. Imports were 2,479,300 tons, and exports 1,386,000 tons.

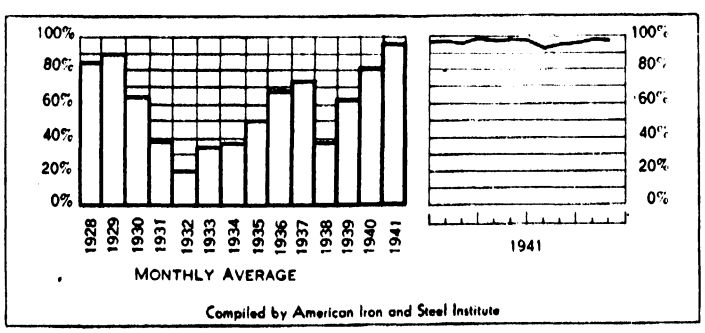
Pig Iron.—Outside of the United States and Canada, the only data since 1938 are the estimates in Table II.



STEEL PRODUCTION in the United States: percentage of capacity

In 1940 the United States produced 42,346,700 long tons of pig iron and ferro-alloys, an increase of 33% over 1939; shipments were 43,081,000 tons. The total for the first 11 months of 1941 was 45,553,000 tons, and for the year was estimated at 49,775,000 tons, 96.7% of plant capacity and 17% increase over 1940. Plant capacity at the end of the year was 53,705,000 tons, against 48,270,000 tons on Jan. 1, and additions planned for completion during 1942 and 1943 would raise this to 61,020,000 tons. At the end of September there had been no imports of pig iron, and exports had been 458,537 tons.

In Canada pig iron production was 1,237,000 tons to the end of Oct. 1941, equivalent to about 1,500,000 tons for the year, against 1,304,300 tons in 1940.

Steel.—As with pig iron, only United States and Canadian figures were reported in 1941; other data in the accompanying tables since 1938 are estimates.

Steel production in the United States in 1940 increased 25% over 1939, to 59,806,000 long tons. To the end of Nov. 1941 the total was 67,469,000 tons, and the full year was expected to reach about 74,000,000 tons, or 97.4% of capacity. The annual plant capacity at the end of the year was 78,497,000 tons, against 70,210,000 tons on Jan. 1; capacity by June 30, 1942 was expected to be 79,769,000 tons, and later additions would bring this to 83,813,000 tons.

As with pig iron, imports of steel were comparatively small, but exports were larger, and increasing. Exports of all types of steel except scrap in 1940 rose to 7,192,500 tons, as compared with 2,315,000 tons in 1939, but at the same time scrap exports declined from 3,577,400 tons in 1939 to 2,823,100 tons in 1940. There was a greater decline for scrap in 1941, the total for the first three quarters being only 611,664 tons, and in the same period exports of steel had also declined to a rate of 5,700,000 tons for the year.

Scrap consumption in 1941 in the United States was estimated to have been close to 53,000,000 long tons, of which 55% was plant scrap and 45% purchased scrap. The supply of plant scrap would automatically be increased as ingot production increased, but difficulty was being encountered in maintaining an adequate supply of purchased scrap. Requirements were about 24,000,000 tons in 1941, but supply was not able to keep up with demand and toward the latter part of the year the scrap content of the charge was being decreased. The increases planned in ingot capacity would require an increase of 15% in purchased scrap to maintain the normal scrap content of the charge, and it was doubtful if this could be accomplished.

Canadian steel production to the end of Oct. 1941 was 1,971,000 long tons, a rate equivalent to 2,500,000 tons for the year, against 2,012,000 tons in 1940. (*See* also BUSINESS REVIEW: *Industrial Groups;* METALLURGY.)

Irrigation. Preliminary figures only were available from the 1940 U.S. federal census to indicate the status of irrigation development in the 19 western states (including Arkansas and Louisiana). On their face they appeared to indicate a recession during the 1930–40 decade, since only 17,912,777 ac. were reported irrigated by all agencies in 1939 as compared with 19,547,544 ac. in 1929. However, the loss was in pasture and other acreages from which crops were not harvested. A comparison of the acreages of irrigated cropland harvested discloses a net increase of between 400,000 and 500,000 ac., notwithstanding the much more exuberant economic conditions in 1929 than in 1939.

This analysis appeared to reflect the limited but not insignificant success of the general effort to improve and stabilize the irrigation supplies of areas already farmed, rather than to reclaim new land. While, as set out in later paragraphs, the U.S. government carried out a number of spectacular construction projects from 1932–41, their generally most important function was the storage of flood flow waters to benefit lands previously dependent upon normal flow and subject to late summer shortages in years of subnormal supply. Thus the higher pasture acreage previously reported included areas flooded only when the water was available. In a strictly economic sense its importance was far less than that of the irrigated cropland harvested.

The 1940 irrigation census included the state of Florida, irrigation statistics for which had not been collected previously. Florida totals were not included in the figures cited above. However, the irrigated acreage reported far exceeded that of several of the western states. Irrigated cropland harvested in 1939 was 123,682 ac., and irrigated pasture 2,509 ac.—a total of 126,191 ac. The irrigated acreages reported by several other eastern states, while far less than that reported by Florida, and mainly disclosive of truck-farm operations, were larger than had been realized. They probably reflected the effects of several years of drought during the decade, which induced specialty farmers to ensure their high-priced crops by the installation of pumping plants or by resort to other means of protection in abnormally dry periods. (*See* also DROUGHT.)

When the snow season of 1941 drew to a close early in the spring, the federal irrigation water supply forecasts for the semiarid areas of western United States predicted a moderate to severe water shortage for all the irrigated areas lying north of a line cutting diagonally northwest to southeast through Oregon and thence eastward across northern Nevada, Utah and Colorado. The mountain snow pack upon which these forecasts were based and which usually supplies most of the water during the growing season, was less than usual northward from this line and greater than usual to the south of it. This usually reliable indicator proved somewhat inaccurate, owing to above-normal late spring and summer precipitation in the areas where a water shortage might have occurred. Approximately a 20% deficiency of irrigation water occurred in cultivated areas on the east face of the Cascade mountains in Washington and Oregon, but elsewhere there was little or no shortage because rainfall lessened the need to irrigate. Abundant irrigation water supply was forecast for Arizona, California, southern Nevada and New Mexico, and these forecasts were fully borne out. Storage reservoirs of the west contained more water at the opening of the irrigation season of 1941 than for any season for many years. The 73 reservoirs in operation on federal reclamation projects in 15 western states contained 41,500,000 ac.-ft. The largest of these reservoirs is Lake Mead, behind Boulder dam on the Colorado river. All five of the reservoirs on the Salt river project in Arizona spilled for the first time.

As for the past several years, federal irrigation projects continued to predominate in construction and expansion programs. During 1941 projects constructed by the bureau of reclamation were prepared to irrigate 4,168,168 ac.—the largest area since that bureau began operating in 1902, representing an increase of 278,628 ac. over that reported for 1940. The area within projects receiving a full supply of water was increased about 50,000 ac. The largest part of the additional area was in the Payette division of the Boise project in Idaho. Facilities for supplying water to the Buffalo rapids project in Montana were available for the first time. The additional acreages receiving supplemental water supplies from storage projects were in the Upper Snake river project in Idaho, the Moon lake project in Utah, the Pine river project in Colorado and the Deschutes project in Oregon.

Under the construction program in progress, 2,370,000 ac. of raw desert land eventually would be brought into cultivation. The largest development in this long-range program was the Columbia basin project which ultimately would irrigate 1,200,000 ac. More than 3,800,000 ac. of land inadequately irrigated would receive more stable supplies through the facilities under construction. Through the water conservation and utilization program the area of 155,000 ac. to be benefited by projects under way would probably be more than doubled as new projects were added. When the comprehensive program was expected to be completed, water would be available for about 11,000,000 ac., more than half of which would be represented by supplemental service for areas which were inadequately irrigated. The bureau of reclamation estimated in 1941 that sufficient water was available in the west to irrigate 22,000,000 ac. in addition to the areas then irrigated, and provided supplemental supplies for 11,700,000 acres.

Work was in progress on 37 projects in 14 western states during the year 1941, continuing the major construction program undertaken by the bureau of reclamation in 1931, when work on the Boulder dam and power plant on the Colorado river in Arizona-Nevada, was started. Ten storage dams and seven diversion dams were under construction. Of these one storage and all seven diversion dams were completed. Those completed were the Crane Prairie, on the Deschutes project in Oregon; Dutch Slough dam on the Delta division of the Central valley project in California; the Entiat and Icicle creek dams nos. 1, 2, 3, 4 and 5, all small diversion dams constructed on the Columbia basin project in Washington, in connection with migratory fish control operations. The dams completed bring to 163 the total number of dams completed by the bureau of reclamation. The nine dams under construction at the end of 1941 were: Grand Coulee on the Columbia basin project in Washington; Shasta on the Central valley project in California; Friant, also on the Central valley project; Green Mountain on the Colorado-Big Thompson project in Colorado; Vallecito on the Pine river project in Colorado; Wickiup on the Deschutes project in Oregon; Marshall ford on the Colorado river project in Texas; Deer creek on the Provo river project in Utah; and Box butte on the Mirage flats project in Nebraska. (*See* also DAMS.)

Twenty-five federal reclamation projects in operation during the year 1941 directly supported approximately 1,000,000 people on irrigated farms and in near-by towns and cities. Supplemental water supplies were furnished to other farms with populations of 100,000. More than 50,000 family-size farm homes had been carved from the desert and as many more were to be provided by projects under construction to meet the growth in western population—twice the national average.

On the Imperial Irrigation district in California, federally aided but not a project of the bureau of reclamation, priming of the All-American canal was started in 1940 and continued through 1941, with service established to approximately 80% of the district lands, comprising about 522,000 ac. of irrigable land. It was contemplated that the All-American canal would furnish the entire water supply of the district by the early spring of 1942. As the priming of the canal progressed, there was a notable decrease in seepage losses throughout the new section. The two hydroelectric plants on the All-American canal were started in February and as the flow through the canal increased, these plants took over an increase in the amount of the district's power load until by late summer practically the entire load was thus served. Extension of the district's drainage system made rapid progress during the year, nearly 100 mi. of new drains having been constructed. As part of the All-American canal project, plans were carried forward during the year for the development of the east and west mesas. Preliminary surveys were completed for a distribution system to serve the first unit of approximately 30,000 acres.

Brazil.—Inspectoria Federal das Obres Contra as Seccas, which conducts the task of making productive and liveable a large section of Brazil, alternately visited by great floods and protracted droughts, has done excellent work in the northeastern states of Brazil. In this section aid to the semiarid areas was being carried out in 1941 in a program including the building of dams and the establishment of lines of communication. The construction of dams, which is the essential part of the plan to reduce the loss of crops by droughts, is the essential part of the campaign against droughts. Six separate developments were being accomplished, located in Ceará, the basins of the Acaráu and Jaguaribe rivers; in Rio Grande do Norte, the basins of the Apody and Baixo Piranhas rivers, and finally in

FORMER DESERT LAND of the Imperial valley, Calif., irrigated by the new All-American canal, produced an abundance of vegetables in 1941

Parahyba, the basin of the Alto Piranhas river. The development for the Acarau comprehends the construction of ten dams, six of which were already finished, the Forquilhas and the Jaibara being the two outstanding. In the Jaguaribe system, the most important of the developments, because of the greater number of dams in the project and under construction, the Lima Campos reservoirs with a storage of 58,300,000 cu.m.; Joaquim Tavora, with 24,000,000 cu.m.; Ema, with 10,400,000 cu.m.; Riacho do Sangue, with 68,200,000 cu.m.; Santo Antonio das Russas, with 24,000,000 cu.m.; Nova Floresta, with 7,600,000 cu.m. and Velame, with 2,500,000 cu.m. were already completed. With the completion of Orós project harnessing 4,000,000,000 cu.m., the system will have been completed. All these dams are within the territory of Ceará.

In the state of Rio Grande do Norte, the system of Baixo Piranhas is the most important, consisting of the following dams: Itaus, with 81,000,000 cu.m.; Cruzeta, with 29,700,000 cu.m.; Condado, with 35,000,000 cu.m.; Riacho dos Cavallos, with 17,700,000 cu.m.; and Santa Luzia do Sabugi, with 11,700,000 cu.m. capacity. The last three of these dams also comprise part of the system of the territory of Parahyba. The second system of Rio Grande do Norte is that of Apody, which has various dams already completed. Among these are Caráubas, storing 11,000,000 cu.m. of water and Lucrecia, storing 27,300,000 cubic metres.

The state of Parahyba has the Alto Piranhas system with the following dams completed: São Goncalo, with 44,600,000 cu.m. of storage; Pilões, with 13,000,000 cu.m. and Piranhas, with 355,000,000 cu.m. Under construction in 1941 was the Curema dam which was expected to store 720,000,000 cubic metres.

India.—It was estimated that the value of crops being raised in British India on areas receiving state aid in irrigation amounted to about Rs. 1,049,400,000 during 1941. From about 10,500,000 ac. in 1878–79, the area irrigated annually by state works alone in 1941 reached a total of 32,433,000 ac.—more than one-seventh of the total cultivated area in British India. It was also estimated that the capital outlay on irrigation and navigation works amounted to Rs. 1,502,800,000 and a gross annual revenue of more than Rs. 135,000,000. Of the provinces with major irrigation works the Punjab continued to lead in magnitude, involving an area of 12,292,000 ac. Madras ranked second in area with 7,565,000 ac., with United Provinces and Sind totalling about 5,000,000 ac. each. In percentage of area irrigated to the total area sown, however, Sind led with 89.1%, Punjab 38.8% and Madras 20.5%. As in previous years, Punjab yielded the largest return on capital invested in productive works with 14.99%, while Madras and United Provinces returned 6.36% and 5.3% respectively.

One of the works completed was the Kistna East Bank canal in Madras; it was planned to supply water for about 42,000 ac. on the mainland and 42,000 ac. on Divi island. In Bombay, the Nira Right Bank canal project was completed. The project included Lloyd dam at Bhatgar and a canal 106 mi. in length capable of irrigating about 132,000 acres.

Mexico.—In Mexico in the Delicias Irrigation district in Chihuahua, most of the canals and their appurtenant structures, necessary to irrigate about 12,500 ac., were completed during the year. In the Juarez Valley Irrigation district, also in Chihuahua, most of the canals, drains and structures were completed and the International dam on the Grande river was completed. In the state of Guanajuato, the Alto Lerma Irrigation district continued maintenance and improvement work with considerable progress on completion of the Salamanca canal.

In Sonora, on the Yaqui River Irrigation district the Angostura dam and its spillway were almost completed and in the state of Tamaulipas the Lower San Juan River Irrigation district carried on construction on the Azucar dam with the continuation of construction of the southern, northern and central dikes. The construction of dike no. 2, the spillway, southern outlet works, Main Rancherias canal and San Pedro canal was continued.

Islam. The war held up any active development during 1941 in the cultural relations among Islamic countries and to a minor extent any notable cultural development within the countries themselves. A good-will mission from the Azhar university in Cairo visited India, and return visits from India were planned, but had to be postponed.

The idea of Arab federation made some progress in that it obtained greater recognition and definition in the world at large and especially with the British and Allied governments. Though Egypt did not join the Saadabad pact, she took a lively interest in the Palestine problem. She pushed forward her internal reforms, administrative and economic. The improvement of her road communications with Palestine and sea communications through the Red sea would enable her to exercise a gradually increasing influence in the central lands of Islam.

The projected Kabul conference of Islamic states did not come about, on account of the disturbed condition of the world. But the delay in the formal meeting of Islamic powers did not mean that the cause of common Islamic understanding made no progress. It is true that the Syrian situation was the cause of some confusion. Syria was to have been emancipated from the French mandate and French control in 1939 and to have been recognized as a sovereign state and a member of the League of Nations in the session of the League assembly in the autumn of that year. But the instability of French politics upset all plans. The Syrian constitution had to be suspended; the Syrian parliament was dismissed; and dictatorial authority was established. The threat of German occupation, with its immediate dangers to Iraq, was met by the advance from the Mediterranean of British and Allied troops, in June 1941. Damascus was soon occupied, and Syria was free by the middle of July. Winston Churchill in his war review of Sept. 29, 1941, made it clear that the British policy, "to which our Free French allies have subscribed, is that Syria shall be handed back to the Syrians, who will assume at the earliest possible moment their independent sovereign rights." Syria and Lebanon were recognized by Great Britain and Free France as independent republics, the former in September and the latter in November 1941.

Indian Islam has for some time been discussing a scheme of mutual understanding among the Muslim provinces of northwest India. The Indian Muslim league gave its countenance to the ideal of Pakistan, which aims at joining together Sind, Punjab, the Northwest frontier province, Kashmir and Afghanistan so as to constitute a Muslim bloc. Kashmir is a feudatory state bordering on British India: its population is mainly Muslim, while its ruler is a Hindu. Afghanistan is an independent country. Sind, Punjab, and the frontier province are provinces of British India. How far it will be practicable to join these three categories of territories in any common scheme of administration time alone can show. (A. Y. A.)

Italian Colonial Empire. The table on page 368 gives essential information relating to the Italian colonial empire. Total area including Italy 1,167,728 sq.mi.; total population 48,406,000.

History.—Civilian activities ceased in the Italian colonial empire when Italy embarked on hostilities in June 1940 and had not been resumed by the end of 1941. Every part of the colonial empire had a theatre of war. The new bloc, known since 1936 as "Italian East Africa," was taken from Italy by British imperial forces. In Eritrea, Italy's oldest colony, Cheren was captured March 27, 1941, and on March 31 Asmara, the capital, capitulated. Italian Somaliland was invaded, mainly by troops from South Africa and India, at the end of January; Kismayu was taken in mid-February; Mogadishu a fortnight later, and before the end of March all resistance was over. In Abyssinia opposition was more sustained, but in January the Emperor Haile Selassie was able to cross his frontier at the head of his own levies, and on April 5 South African troops entered Addis Ababa after the most rapid military advance in modern history. Though guerrilla warfare and "mopping-up operations" continued until the fall of Gondar Nov. 27, the surrender of the duke of Aosta at Amba Alagi on May 20 marked the end both of organized Italian resistance and the five years' occupation of Ethiopia. One of the most important consequences of the British capture of Italian East Africa was the opening by President Roosevelt of the Red sea to U.S. shipping.

Albania and most of Libya were still in the hands of the axis powers at the end of 1941, though the British launched their

second offensive against the latter Nov. 18 and captured large areas west of the Egyptian frontier. During 1941 Italy added to her territorial possessions by the annexation in April of large tracts of Yugoslavia, including the greater part of Slovenia (the rest having been taken by Germany) with a population of 1,250,000, the coast of Dalmatia, with its ports and islands, and part of Montenegro. Italian Literature. The war, by virtually suspending communication between Italy and the American continent, arrested the flow of books and of magazines. Any survey of the literary production of Italy for 1941 must of necessity be limited to the first quarter of the year and be based on restricted material.

A distinction should be established between the plethora of aulic writers vegetating on the margin of literary life and the sound literary output which remains true to the high standards of Italian writing and scholarship. The former endeavoured to depict anti-Gallic Machiavellis, Manzonis and Vergas, continued with sadistic pleasure their anti-French crusade, shed tears of ink on the sad state of those Italian populations living in the Ticino canton, Corsica and French Morocco, and ransacked Dr. Goebbels' pamphlets for arguments in order to hammer into the minds of the recalcitrant Italians that Semitism and Anglo-American plutocracy are responsible for their plight. In an effort to divert the Italians from conditions at home, fascist writers of no repute cluttered the market with books on the oil fields, coal mines and rich colonies of the United Nations which would soon belong to the victorious axis.

Fascist editors issued strong appeals to the Italian writers to organize and make ready for the gigantic mission which would be theirs in the postwar world, when fascist and nazi cultures, spreading over all of Europe, U.S.S.R., the far east and the two Americas, would provide them not with 28,000,000 Italian readers but with hundreds of millions of persons.

However, a careful study of the books published revealed that the majority of Italian writers and publishers had not been carried away by this mirage of the fascist future, and tried to produce and publish works of a serious nature.

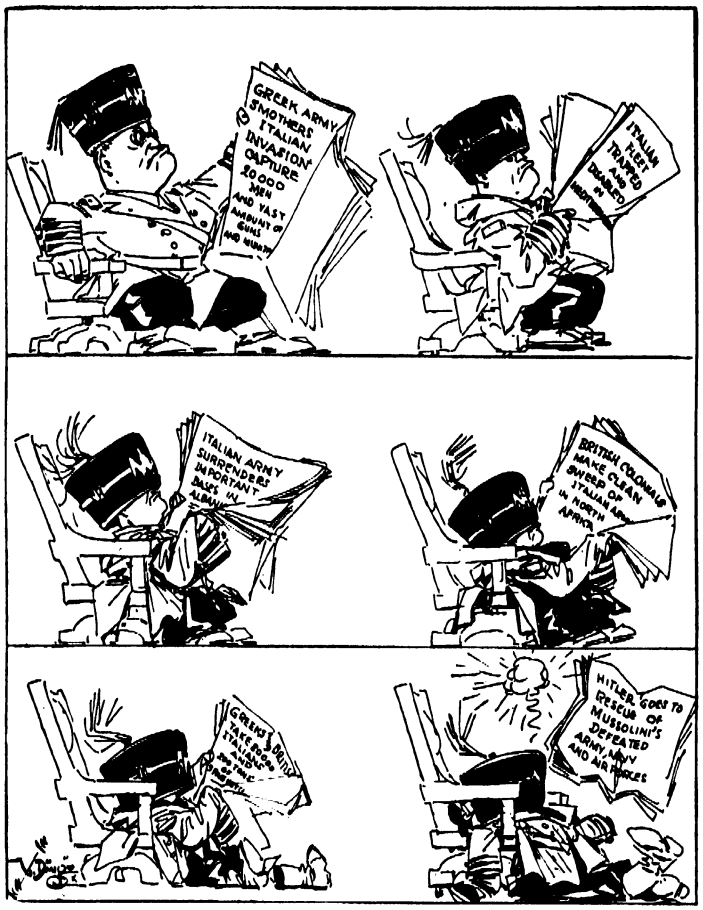
The most important contributions seem to have been made in the fields of history, philosophy and literary criticism. D. Scioscioli published the first part of *Il Dramma del Risorgimento sulle vie dell'esilio* (Signorelli), containing profiles, plots and hitherto secret material garnered from unedited documents relating to F. Buonarroti, F. Confalonieri, V. Gioberti, G. Berchet and other exiles who lived in Belgium between 1930 and 1940. An interesting history of 19th century life through its costumes and styles was provided by R. Carrieri in his *Immagini di moda, 1800–1900* (Domus). Several long series on Rome, its emperors, and on great Italians of the past, recalling Italy's imposing historical heritage, were regularly published by U.T.E.T. and the Istituto di Studi Romani. The 40th anniversary of Verdi's death was marked by numerous studies on the composer's life and art, the most notable among which are G. Roncaglia's *L'ascensione creatrice di G. Verdi* (Sansoni), G. Bongiovanni's *Dal carteggio inedito Verdi-Vigna* (Giornale d'Italia), *Autobiografia dalle lettere* (Mondadori) and A. Lancellotti's *G. Verdi 1813–1901* (Palombi). Important in the field of philosophy are *Il Pensiero di Giordano Bruno* (Sansoni) and *La formazione della filosofia politica di B. Croce* (Einaudi) by the promising young scholar, A. Mautino, who died at the age of 21. E. P. Lamanna added a second volume to his history of philosophy (Le Monnier) and G. De Ruggero his third (Laterza), which goes from Vico to Kant. Of considerable interest to students of G. B. Vico's personality are his *Versi d'occasione e scritti di scuola* (Laterza).

Dante criticism was further enriched by M. Barbi's two new works, *Con Dante e coi suoi interpreti* (Le Monnier) and *Problemi di critica dantesca* (Sansoni). The numerous celebrations of the centenary of Verga's birth throughout Italy and the many valuable works written for the occasion and which continued to appear in 1941 testified to the great Sicilian novelist's unabating popularity. M. Cappellani's *Vita di G. Verga* (Le Monnier) and E. De Michelis' *L'arte del Verga* (La Nuova Italia) deserve special mention.

Two writers who made a place for themselves in contemporary Italian letters were C. Alvaro whose new volume of short stories, *Incontri d'amore* (Bompiani), contains excellent allegorical and symbolic visions of his youth, and B. Tecchi, whose novel *Giovani amici,* received high praise for its fine psychological study of the development of two young boys. The others, Samminiatelli, Cecchi, Mura, Moscardelli and Gotta, continued in tried and true paths to appeal to their faithful clientele of readers. (M. F. C.)

Italian Somaliland: *see* ITALIAN COLONIAL EMPIRE.

Italy. A kingdom consisting mainly of the peninsula projecting south into the Mediterranean from the mass of central Europe. The land boundaries, which reach as far north as



"THE SHRINKING VIOLET OF ITALY," by Darling of the *New York Herald Tribune*

46°40′, are formed by France, Switzerland, Germany and Yugoslavia. Capital, Rome. Ruler: King Victor Emmanuel III; chief of government (il duce): Benito Mussolini (*q.v.*). National flag: green, white and red in vertical stripes, with the arms in the white stripe.

Area and Population.—Excluding Libya: area, 119,764 sq.mi.; pop. est. (Jan. 1, 1940), 44,815,000. Chief cities (pop. 1936): Rome (1,155,722), Milan (1,115,848), Naples (865,913), Genoa (634,646), Turin (629,115). Language, Italian; religion, Roman Catholic.

History.—The year 1941, the year XX of the fascist era, was a sad one for Italy. In January her troops in Libya were in full retreat; by December's end they had either surrendered or were in thorough rout, and the loss of the entire province seemed imminent. And as the year closed, Italian resistance in Ethiopia was at an end, and Italian regiments drafted for the nazi invasion of the U.S.S.R. were being terribly mauled both by the Red armies and by the Russian winter. The Italian flag, it is true, hung over the Parthenon at Athens; Albania as an Italian province had been enlarged in area; and a cousin of the king of Italy had become ruler of the puppet state of Croatia (*q.v.*); but in every instance it was not Italy but nazi Germany that had made possible these successes. The tinsel trappings of victory might be wrapped around Mussolini, but the reality that lay behind was the German Wehrmacht, as ruthlessly determined to make Italy toe the mark as to bring Vichy France to heel.

During the winter of 1940–41 bitter storms and heavy snowfall made it possible to keep the advancing Greeks at bay in the Albanian mountains; but in Africa during January and February there was no news but of disaster. On Jan. 5, the Libyan seaport of Bardia surrendered, the British capturing 25,000 Italian troops; and on Jan. 22, Tobruk, a larger seaport to the west, capitulated, the British bagging 14,000 additional Italians. And still the fascist retreat in eastern Libya continued. Falling back to their main base at Bengasi, the Italians tried hard to stem the tide. But the British army of the Nile, a small force of Britons, Australians, New Zealanders and Indians, was not to be denied. On Feb. 6, Bengasi fell; and of Italy's North African army of 280,000, little more than one-third remained. Meanwhile, during February, the British drove into Italian Somaliland and Eritrea, thus compelling the harassed foe to withdraw hastily from the outposts they had conquered in the Sudan to defend Ethiopia (*q.v.*). The British followed hard at their heels, arming as they did so the followers of Haile Selassie. By the middle of March, the British had penetrated some 100 mi. into Ethiopia, capturing the important city of Harar on the railroad line to Addis Ababa.

The history of Italy as an African power, and perhaps as a naval power too, seemed about ended. The exploits of the royal navy in Nov. 1940 now were duplicated. On March 28, one Italian battleship, three heavy cruisers and two destroyers were sunk or damaged in the battle of Matapan, off the southern tip of Greece. On both land and sea the Italians seemingly were routed.

With the coming of the spring, the nazis dashed to the help of Italy. German troops arrived in Libya, some by air transport, some by troop ships and some, presumably, through French Tunisia. Simultaneously the nazis concentrated their troops on the Greek border, and the British were pledged to do their best to assist the Greeks. The British kept their word, transferred the bulk of the army of the Nile from Libya to Athens and Salonika, and retained but a skeleton rear guard in Libya.

Once again in North Africa the way was open for the axis. The 100,000 Germans, equipped with tanks, planes, plus what remained of the Italian army, counterattacked successfully. On April 3, the British evacuated Bengasi in swift retreat; on April 8 they were by-passed at Tobruk by the advancing Germans, supposedly assisted by their Italian allies. Five days later Bardia fell to the axis, and by the middle of April Germans and Italians were over the border in Egypt. Here their offense stopped, partly because of the weather, partly because of the necessity of first conquering the besieged British garrison at Tobruk on their flank before advancing toward Alexandria.

Some reflected glory fell to Italy as the result of this April campaign in Libya, but none at all could be credited to Italian arms in the Balkans in this same month in April. Within a few days, in that difficult terrain, the nazis forced their way through southern Yugoslavia, joining hands with their sluggish fascist allies on April 11 in Albania. Ten days later the Greeks in the Epirus and Macedonia, realizing their helplessness, surrendered to the Germans. Mussolini, fearful of his prestige, did not announce this fact to his people. Ordering his own troops to advance, he lost 6,000 additional soldiers in an attack on the Greeks. Two days later the Greeks surrendered all over again, this time to the Italians—the result, a triumph, of a sort, for the duce.

The Italians staged another triumph of like character on the small island of Corfu. They raced thither in order to outspeed their nazi allies; but the islanders resisted the Italian bombardment bravely, preferring to surrender to the Germans. The latter, however, were unwilling to accept Corfu since the Italians did arrive first, and so the Italian tricolour rather than the swastika waved over Corfu. Finally the troops of Mussolini made a third conquest, the city of Ljubljana, within the borders of Slovenia, the Slovenes making no resistance.

With Italy's contribution to the conquest of the Balkans so slight, it is surprising that the Germans presented her with as much booty as they did. The Germans, of course, had a good deal to give away—all of Yugoslavia and all of Greece. A considerable part of the former was presented to Bulgaria, a larger slice

(Slovenia) was reserved for Germany, and to Italy went a bit of Yugoslavia north of Albania and certain islands in the Adriatic. Certain Greek territory was likewise added to Albania, and the Italians were authorized to police a part of conquered Greece. Germany, furthermore, having no immediate urge to annex Croatia, and having promised the Croats their independence, suggested an Italian duke as the new king of Croatia.

These settlements would have given Italy more than the proverbial jackal's fraction if the policing of Greece meant further booty. But the Germans had no intention of leaving any booty there for the Italians; instead they looted Greece in most thorough fashion first, removing everything of any value that could be moved, consuming everything that could be drunk or eaten. Only after that were the Italians invited in. And even so they were not given full authority. Many Germans stayed behind in key positions, to give orders not simply to conquered Greeks but also to conquering Italians. But Mussolini made the most of it. On June 10, the anniversary of Italy's entrance into the war, he announced, "It is absolutely mathematical that in April, even if nothing had happened to change the Balkan situation, the Italian army would have overcome and annihilated the Greek army."

The second half of the year was one of increasing unpleasantness in Italy. One disturbing factor was the large number of Germans within the country. How many were stationed there is unknown, but they were numerous and held key positions. Furthermore, they bought lavishly in depreciated currency just at a time when the Italians began to feel keenly the lack of consumers' goods. By autumn, almost everything sold was rationed. One could buy either a suit of clothes or a pair of shoes, but not both. There were severe restrictions on foodstuffs. The scarcity of coal was so great that the use of it was forbidden in northern Italy until Dec. 1, and in southern Italy until Dec. 15. U.S. cigarettes were reported as selling at $4 a pack. Within the ranks of the fascist party there were misgivings. The Italians had not forgotten the advice of Machiavelli that one can strengthen political movements by "a return to their origins." In its origin Italian fascism had been an anti-rich agitation. Now within the bosom of the party there were renewed stirrings against the wealthy. This the duce apparently took note of, for in the autumn there was a shake-up in the fascist ranks, many old leaders being demoted, and new ones appointed.

The news from Africa continued bad. The Italian-German invasion of Egypt made no headway, and the Italian-German forces were unable to dislodge the British from Tobruk. In Ethiopia Haile Selassie was back on his throne. The remaining Italian garrisons in Ethiopia escaping north had no place to go after meeting their fellow nationals retreating south from Eritrea before the advancing British. There could be no hope whatever of their ultimate rescue. The Duke of Aosta, Italian viceroy in Ethiopia, formally surrendered that colony to the British as early as May, but despite that fall, many garrisons fought on. Particularly vicious and protracted was the fight for Gondar, Italy's last outpost in Ethiopia. The Italians here proved that they could fight and fight well if they wanted to. Gondar is a fertile plateau in northern Ethiopia, only to be reached by steep and winding trails. On this plateau some 15,000 Italian troops found sanctuary and withstood a siege of seven months, thus vying with the beleaguered British at Tobruk in all that concerns hardihood and endurance. They made of the plateau a strong fortress, surrounded by barbed thorns in lieu of barbed wire. From every side the imperial forces drew in on Gondar, bombing it mercilessly from the air. Italian ammunition ran low. One battalion without ammunition charged with the bayonet, until almost all had died. Then, on Nov. 27, Gondar surrendered. All Ethiopia was now cleared of Italian troops except possibly for a lost patrol of 50 men who, according to rumour, were in the northeastern part of that country, hiding in caves but with a radio to keep in touch with Italy.

In November and December the Italians received their worst drubbing in the war, this time in conjunction with their nazi allies. The British army, at last well equipped with planes and tanks largely U.S. in origin, drove back the Italo-German forces in eastern Libya, even farther than they had driven them in January and February. This time the fighting in the desert was more ferocious than before. A great part of it was done by charging tanks which thrust at one another like prehistoric monsters. The campaign was carefully prepared; the British cut deep into the desert and drove due west in hopes of encircling the enemy. Contact with the besieged garrison at Tobruk was made, only to be lost and won again. The Italians and Germans in Bardia and in Halfaya ("Hell Fire") pass in western Egypt were cut off from their comrades, who fled westward toward Bengasi. Bardia fell once more to the British Jan. 2, 1942.

This time the British excelled their record of the previous February, for they not only captured Bengasi for a second time, but by the end of the year had penetrated 93 mi. south of it to Agedabia.

Here the axis armies stood at bay as the year ended.

Education.—Public elementary schools in 1937–38, 131,580; pupils, 5,411,596. Students in secondary schools, 647,505; in universities, 77,429. A special school charter of 1939 required all education in Italy to have a fascist stamp.

Defense.—In 1939 (estimated): army, 900,000; planes, 5,500; battleships, 6; cruisers, 22; destroyers, 61; torpedo boats, 71; submarines, 105.

Finance.—Estimates for year ending June 30, 1940: revenue, 24,560,000,000 lire; expenditure, 29,316,000,000 lire. Lira quoted Dec. 1939 at 5 cents; in June 1941, 5.262 cents.

Trade and Communication.—In 1939: imports, 11,061,000,000 lire; exports, 8,007,000,000 lire. Railway, 29,220 km. Shipping: 2,301 sailing vessels, 1,057 steamships, 293 motorships. Total over 2,000,000 metric tons.

Agriculture, Manufacture and Minerals.—Livestock in 1938: horses, 791,120; asses, 791,390; mules, 431,150; cattle, 7,666,890; pigs, 2,940,440; sheep, 9,467,400; goats, 1,828,070. In thousand quintals: wheat, 12,420,000; maize, 3,724,000; beans, 1,625,000; olives, 2,038,000.

Most important industry, textiles, with 938 factories in 1938. In minerals, sulphur continued to lead, there being mined, in 1938, 2,363,000 metric tons, to 930,000 tons of iron pyrites, next competing mineral. Jackson, Robert Houghwout (1892–), U.S. jurist, was born Feb. 13 at Spring Creek, Pa. Following his graduation from Albany law school he was admitted to the New York bar in 1913 and practised law in Jamestown, N.Y. As counsel and in official capacities he served various railroad, banking and telephone interests. In 1918 he became corporation counsel for Jamestown. The year 1934 found him in Washington, D.C. as general counsel for the bureau of internal revenue, By appointment of President Roosevelt he served as U.S. assistant attorney-general during 1936–38. In 1938–39 he was solicitor-general of the United States. In Jan. 1940 President Roosevelt appointed him U.S. attorney-general and on June 12, 1941 he was made associate justice of the U.S. supreme court.

Jamaica: *see* WEST INDIES, BRITISH.

James, Arthur Curtiss (1867–1941), U.S. railroad executive, was born June 1 in New York city, the heir to a vast fortune founded by his grandfather

in mining operations and expanded by his father in the railroad industry. After taking an M.A. degree at Amherst college in 1889, he worked as a mail clerk in his father's corporation. His first experience in railroading was in managing the St. Paul & Pacific, which expanded into the Great Northern. In 1901 the Chicago, Burlington & Quincy was added to the James' railroad empire and in 1926 he acquired the Western Pacific, joining it to the Northern Pacific, and thus controlled a trunk system stretching from Chicago to California. When his father died in 1907, James inherited a $26,000,000 fortune in copper, gold and silver as well as railroad holdings. When he retired in 1939 he was considered one of the 12 wealthiest men in the United States and the largest individual holder of railroad shares. He died in New York city, June 4.

Japan. An empire; capital, Tokyo (*q.v.*); ruler, Emperor Hirohito; premier at the end of 1941, Gen. Hideki Tojo. A chain of islands in the western Pacific, stretching from South Sakhalin (50° latitude) to the South Seas mandated islands, which extend over a great expanse of the Pacific, some of them being located near the equator; includes Chosen (*q.v.*), on the mainland of Asia, and the small Kwantung leased territory, with the city of Dairen, on the Liaotung peninsula. Japan proper consists of four large islands, Honshu, Hokkaido, Shikoku and Kyushu, with many adjacent smaller islands. Chosen, Formosa (*q.v.*) and Sakhalin are administered as colonies, along with the South Seas islands, former German possessions, which were granted to Japan under a mandate from the League of Nations after World War I. The total area of the Japanese empire in 1941 was 263,359 sq.mi., of which Japan proper constituted 148,756 sq.mi. Population of the empire (census of 1935) was 97,697,555; of Japan proper 69,254,148. An estimate of the Cabinet Statistics bureau placed the population of the empire at 103,087,100 on Dec. 1, 1937. The same organization estimated the population of Japan proper at 72,875,800, as of Oct. 1, 1939, an increase of 653,100 over 1938.

History.—Far and away the overshadowing event in Japanese history during 1941 was the launching of war against two great western powers, the United States and Great Britain, by means of surprise attacks on the large U.S. naval base at Pearl Harbor, Hawaii, on the Philippine Islands and on British far eastern possessions. The attack on Pearl Harbor was in the form of an air raid at dawn on Dec. 7 and was accompanied by declarations of war against both the United States and the British empire. On the following day the U.S. congress, following President Roosevelt's recommendation, voted for a declaration of war against Japan.

Japan enjoyed the advantage of surprise and careful preparation, and the first few weeks of the war were marked by an almost uninterrupted series of military successes. The raid on Pearl Harbor, as audacious as it was treacherous, led to the sinking of one battleship, the "Arizona," the capsizing of another, the "Oklahoma," the sinking of three destroyers, a minelayer and an old target ship, the "Utah," and the crippling of an unspecified number of vessels. A considerable number of U.S. planes, including many new bombers, were also destroyed.

After striking this hard blow at the main U.S. naval force in the Pacific, Japan turned against the principal British and U.S. outposts in the orient. Hongkong, the picturesque rock which was also one of the world's greatest ports and which had been a British crown colony for a century, fell on Dec. 25, 1941. The gallant last stand of the British and Canadian garrison on the rocky fastnesses of the island was shortened by the destruction of sources of water supply.

The international settlement at Shanghai, from which the last detachment of U.S. marines had been withdrawn, was taken over without resistance, and the same fate befell the foreign concessions at Tientsin. After preliminary landings in small force and bombing attacks which destroyed a considerable number of U.S. planes, the Japanese landed in force in Lingayen bay and in some areas south of Manila and initiated a pincer movement against the Philippine capital.

KICHISABURO NOMURA (left), Japanese ambassador to the U.S.A., greeted Saburo Kurusu, special envoy from Tokyo, as the latter arrived at Washington, D.C., Nov. 15, 1941, to begin his so-called "peace talks" with U.S. government officials

The commander in chief of the U.S. and Filipino forces, General Douglas MacArthur (*q.v.*), proclaimed Manila an open city and transferred military and naval equipment and installations elsewhere, but the Philippine capital was severely bombed on Dec. 27. It was occupied by the Japanese Jan. 2, 1942, and President Manuel Quezon's secretary, Jorge Vargas, was installed as mayor. President Quezon himself apparently remained loyal to the U.S. connection. General MacArthur withdrew his main forces into the rugged Bataan peninsula, north of Manila; and the island stronghold of Corregidor, commanding the entrance of the Bay of Manila, held out against repeated Japanese bombing attacks. The Japanese effected a landing in force at Davao, on the southern side of Mindanao. Most of the 20,000 Japanese in the Philippine archipelago live in the Davao region, where they are largely engaged in raising hemp.

Two small island outposts of the United States in the western Pacific, Guam and Wake (*qq.v.*), were occupied by the Japanese. Guam, which is surrounded by Japanese mandated islands, fell after a few days; Wake, with its small garrison of some 400 marines, held out gallantly and inflicted considerable losses on the Japanese attacking forces in ships and planes before it finally succumbed to superior strength.

The Campaign in Malaya.—More important, from the standpoint of the general strategy of the war, than the seizure of Hongkong and the Philippines was the Japanese drive into the elongated Malay peninsula, with the great British naval base of Singapore (*q.v.*), located on an island at the tip of the peninsula, as their obvious objective. Malaya is, with the Dutch East Indies, one of the world's two main sources of tin and rubber, and Singapore was built as a main bastion of defense for Australia and New Zealand to the southeast and for India to the west.

Thailand fell after a very feeble show of resistance; Japanese propaganda had long been active among the younger Thai military and naval officers. The Japanese succeeded in sinking Great Britain's two capital ships, the "Prince of Wales" and the "Repulse," in far eastern waters in the first week of the war. Exploiting air and naval superiority, they advanced more than 400 mi. during the first few weeks of the war, pressing down both sides of the Malay peninsula and occupying Penang, second city of the Straits Settlements after Singapore. By Jan. 10, 1942, they were on the outskirts of Kuala Lumpur, capital of the Federated Malay States and less than 200 mi. from Singapore. One method of advance was to utilize shipping and constantly effect landings in the rear of the defending forces. While the number of Japanese forces engaged in the invasion of Malaya was generally estimated at about four divisions, the British and Australian forces which were resisting the advance were very substantially outnumbered.

The Netherlands Indies was included in the new area of hostilities, and a number of sinkings of Japanese warships and transports by Dutch submarines was reported. The Japanese carried out a number of air attacks on Dutch islands and effected landings in some force on North Borneo, occupying the British protectorate of Sarawak.

(*See* WORLD WAR II.)

Prelude to War.—While the Japanese attack was sudden and unannounced, the war began as the climax of a long period of increasing strain and tension in Japanese relations with the United States and Great Britain. There had long been an irreconcilable conflict of view about the status of China, and Japan's close association with the axis powers under the tripartite pact of Sept. 27, 1940, added another element of friction.

Shortly after the beginning of the German-Russian war Japan, most probably with German diplomatic co-operation, obtained an agreement with the Vichy regime which provided for the movement of French troops into southern Indo-China and the establishment of air and naval bases there. (The Japanese had occupied northern Indo-China in the autumn of 1940.)

The United States, acting in close co-operation with the British and Netherlands governments, replied to this Japanese move into southern Indo-China by freezing all Japanese assets and virtually stopping all trade with the island empire on July 25, 1941. Japan on Aug. 4 suspended shipping to the United States. As Japan was cut off by blockade and by the German-Russian war from any contact with Europe, the concerted action against its foreign trade was a severe blow to its economy, which was forced to carry on with what resources were available in the regions of East Asia under Japanese control and with accumulated stockpiles.

Premier Prince Konoye (*q.v.*) on Aug. 28 suggested to President Roosevelt a resumption of diplomatic discussions with a view to breaking the deadlock. Early in November, after Konoye had been replaced by General Hideki Tojo (*q.v.*), a veteran Japanese diplomat, Saburo Kurusu (*q.v.*), was sent to Washington as a special envoy to carry on further discussions with the U.S. government.

There were several meetings between Kurusu and the Japanese ambassador, Admiral Kichisaburo Nomura, and President Roosevelt, Secretary of State Hull and other U.S. representatives. No full record of the negotiations had been made public at the close of 1941. There was reason to believe, however, that a compromise proposal was under consideration for a three months' "truce," during which time Japan would undertake to give some guarantees against further aggression, while the "freezing" restrictions would be relaxed. But the proposal was finally rejected because of strong protests on the part of the Chinese, who, together with the British, Dutch and Australians, were kept informed of the progress of the discussions.

Secretary Hull presented to the Japanese envoys on Nov. 26 a note which called for the withdrawal of all Japanese armed forces from China and Indo-China. The note also proposed the mutual withdrawal of trade restrictions, the unfreezing of assets and the conclusion of a multilateral nonaggression pact among Japan, the United States, China, the Netherlands, the soviet union and Thailand. The Japanese reply to this note, delivered on Dec. 7 just as the news of the attack on Pearl Harbor was arriving, rejected these proposals.

Japan in China.—There was no great change during 1941 in the comparatively static military and political situation which had prevailed in China after the more active period of the Japanese invasion ended in the autumn of 1938 with the capture of Hankow and Canton. The Japanese continued to bomb Chungking and other Chinese cities in the interior. The Chinese guerrillas harassed the areas which were under Japanese occupation. No large town or area changed hands except temporarily. At one time the Chinese pushed into Ichang, the town which represented the farthest point reached by the Japanese on the Yangtze river, but they were driven out again.

The Japanese made two more drives against Changsha, capital of Hunan province, one in September, the other after the outbreak of the war with England and the United States. In each case they reached the city, accomplished some destruction and withdrew. The Japanese interpretation was that these were successful punitive expeditions. The Chinese claimed notable victories. There was some Chinese pressure on the Japanese lines around Hongkong, but not enough to relieve the Crown Colony. The Chinese government formally declared war on Japan after the outbreak of war between Japan and the United States. (*See* also CHINESE-JAPANESE WAR.)

Japan and the Soviet Union.—The Japanese foreign minister, Yosuke Matsuoka (*q.v.*), on his return from a trip to Berlin and

Rome, signed a five-year nonaggression and neutrality pact with the soviet union on April 13, 1941. The pact was interpreted in some quarters as an agreement of mutual interest. It guaranteed Japan's rear in the event of a conflict in the south Pacific. It gave Stalin an assurance that he would not be attacked in the east if he should find himself involved in conflict with Hitler in the west.

At any rate the pact worked out thus in practice: Japan took no part in the German attack on the soviet union and even allowed some U.S. tankers to enter Vladivostok. And, when Japan threw its main resources into the drive toward the south, the soviet union, although intimately associated with Great Britain and the United States in the war against Germany, failed to fulfil the optimistic predictions of some observers who anticipated that soviet bombers over Japan's large cities and soviet submarines in Japanese waters would make an important contribution to the defeat of the island empire.

Internal Conditions.—For Japan, 1941 was a year of growing strain and tension, of more severe rationing and dislocation of normal trade, especially after the cessation of trade relations with the United States, the British empire and the Netherlands Indies, and of feverish secret preparation for the desperate adventure that began on Dec. 7. There were two shifts of cabinet, one on July 18, when Prince Fumimaro Konoye remained premier, merely reshuffling his ministers and dropping the foreign minister, Yosuke Matsuoka; the second on Oct. 18, when General Hideki Tojo, the former war minister, became premier. It is possible, although certainty on the point cannot be attained because of the lack of evidence, that the accession to power of Tojo, an intimate associate of two of the most powerful leaders of the Japanese military factions, Generals Toshizo Nishio and Seishiro Itagaki, marked the definite decision of Japan to strike with all its force.

There were several symptoms of preparation for a supreme crisis. A special session of the cabinet on July 12 decided on an extension of government control over finance, industry, production and distribution. The National Mobilization act of 1938, which gave the government unlimited power to draft men for industry and to appropriate plant and economic resources, was invoked on Aug. 11, 1941.

Education and Religion.—There were 48,637 schools of all types in Japan in 1938, with 15,638,780 pupils. Elementary education is compulsory for children between the ages of 6 and 14. The percentage of attendance was 99.59. There were 563 middle schools in Japan in 1938, with 364,486 pupils, and 45 universities, with 6,385 professors and 72,968 students. Shinto, the indigenous faith of Japan, possesses some characteristics of a state religion, since the performance of obeisance at national shrines is required of all Japanese. However, the authorities interpret this in a nationalist rather than in a religious sense, and the Japanese constitution provides for freedom of religion. In 1936 there were in Japan 41,127,307 Buddhists, divided into a number of sects, and 16,525,840 Shintoists. U.S. and British missionary work in Japan was terminated by the war. In 1938 there were 215,166 Japanese Christians of the Protestant faith, 111,856 Roman Catholics and 41,251 adherents of the Greek Orthodox church. A law on the control of religions, enforced after April 1, 1940, gave the authorities greater supervisory powers, and after its enactment there was a tendency for Japanese Christian groups to exclude any kind of foreign direction of their activities.

Defense.—The Japanese army is based on the principle of conscription, with liability to active service between the ages of 17 and 40. The army was obviously considerably expanded from its peacetime strength of less than 250,000 after the outbreak of the war with China in 1937. It was unofficially estimated that Japan in Dec. 1941 had about 1,800,000 men under arms from the Siberian border to the Malay peninsula, organized in 60–66 divisions.

The Japanese navy kept its strength secret after the expiration of the Washington treaty of naval limitation at the end of 1936. It was estimated that the minimum strength of the navy in Dec. 1941 was 10 battleships, 7 aircraft carriers, 44 cruisers, 126 destroyers and 69 submarines. It was reported that Japan had started the construction of four or even eight 45,000-ton battleships, and it was variously guessed that one, two or even three of these vessels were ready for service at the end of 1941. One of the older Japanese battleships, the "Haruna Maru," was reported sunk off the Philippines by the gallant action of the U.S. air officer, Captain Colin Kelly (*q.v.*). The Japanese did not officially admit the loss of this vessel.

Banking and Finance.—The unit of currency is the yen (pegged at a nominal value of 23.48 U.S. cents until the outbreak of the war). The value of the yen in the free exchange market at Shanghai was much lower; but any kind of exchange ceased after the beginning of hostilities. The Japanese have made a practice of paying their troops in military notes, the redemption value of which is doubtful, with a view to making occupied regions pay the cost of occupation. This practice was apparently followed in the Philippines, as well as in China. The Japanese budget of 1941–42 was fixed at 13,875,000,000 yen, of which 7,574,000,000 yen had to be borrowed. It was a budget of record size. The national debt, which was 10,578,000,000 yen in 1937, was 32,936,000,000 yen in 1941. The amount of currency in circulation was 1,865,703,385 yen at the end of 1936; it was 4,566,000,000 yen in Aug. 1941. It was estimated that Japan's national income in 1939 was 25,500,000,000 yen, of which 6,500,000,000 yen went for war and armament expenditures. The income for 1940 was 30,000,000,000 yen, of which 7,500,000,000 or 8,000,000,000 was devoted to war and armaments.

The Bank of Japan is the central bank of issue. The Yokohama Specie bank is in charge of foreign exchange transactions and finances foreign trade. Commercial banking is mainly in the hands of seven large banks: the Mitsui, Mitsubishi, Dai-ichi, Sumitomo, Yasuda, Daihyaku and Sanwa. Among the foreign banks which operated in Japan until the outbreak of war with the western powers were the National City bank of New York, the Hongkong and Shanghai Banking corporation, the Chartered Bank of India, Australia and China, the Nederlandsch-Indische Handelsbank.

Trade and Communication.—Information on Japanese foreign trade was officially withheld after 1940, so that the last available figures in 1941 were for 1939, when Japanese exports amounted to 3,932,926,000 yen and imports to 3,127,460,000 yen. During the first half of 1940 (when figures were still published) exports were 2,018,980,000 yen (an increase of 403,450,000 yen over the corresponding period in the previous year), and imports were 1,856,729,000 yen (an increase of 266,577,000 yen). A marked tendency in Japan's foreign trade for several years had been to develop a large surplus in trade with Manchoukuo and occupied China, with the result that there was a deficit in the balance of trade with countries outside the so-called yen *bloc*. There must have been a very drastic curtailment both of imports and of exports after the economic retaliatory measures which were applied by the United States, the British empire and the Netherlands Indies in July 1941. These measures cut off about 75% of Japan's normal imports; and there must have been a roughly similar diminution of exports. The United States shipped to Japan 27,994,624 barrels of oil in 1939 and 22,920,299 barrels in 1940. Japan's domestic production of oil is only about 7,000,000 barrels a year. The Japanese drive to the south was certainly partly designed to obtain by force what had been cut off in normal trade. The Netherlands Indies contain the only large oil deposits in the orient. Malaya and the Netherlands Indies are the world's largest producers of tin and rubber. The Philippines and the Netherlands Indies are rich in sugar; there is iron in Malaya and in the Philippines; and the latter islands contain considerable reserves of manganese and hemp.

There were 27,294 km. of state and private railways in Japan in 1938, a substantial increase over 1937, together with 5,206 km. in Chosen, 3,470 in Formosa and 342.9 in South Sakhalin. The number of registered ships in the Japanese empire on Sept. 30, 1938, was 4,842, with a gross tonnage of 5,339,632. The number of sailing ships was 17,791, the tonnage 1,046,476. Commercial aviation is centralized in the hands of a semigovernmental monopolistic company, the Japan Airways company, which was established in 1930 with a capitalization of 100,000,000 yen. The length of its routes in 1938–39 was about 10,000 mi. The number of flights was 17,144, the aggregate length of flights 6,209,873 km., the number of passengers carried 69,268, the quantity of goods conveyed 297,807 kg., the amount of mail 819,261 kg. The most important air routes in Japan are Tokyo-Dairen, Fukuoka-Taihoku, Tokyo-Sapporo, Tokyo-Hsinking, Tokyo-Peking, Fukuoka-Shanghai-Nanking, Tokyo-Bangkok and Tokyo-Palau (administrative centre of the South Sea islands). The three last named lines were opened in 1938 and 1939.

There were 13,648 telegraph stations in Japan proper in 1939, and 75,838,875 domestic and 1,261,295 foreign messages were handled in the year 1938–39. The length of the inland telegraph lines, 425,752 km. in 1938, was not stated in 1939, no doubt in line with the general policy of intensified military secrecy. There were 6,197 telephone exchanges in Japan on Sept. 30, 1939, and 1,006,498 subscribers to telephone service.

Agriculture.—There were 5,519,480 farm households in Japan in 1938, a figure which continued to show a slight but steady tendency to decline. It is probable that the need for munitions workers caused a shift of population to the towns; there was some planned settlement of young Japanese farmers in Manchoukuo. About 15% of the total area of Japan is arable land, and rice is the most important single crop and the staple food of the Japanese people. Silk is another important agricultural product; exports in 1939 were valued at 506,844,000 yen. There is a high proportion of fishermen among the Japanese peasants who live along the seacoast; and the basic diet of the masses of the Japanese people consists of fish and rice, supplemented by sweet potatoes, radishes and other home-grown vegetables and by various soybean preparations. Because of the intense crowding (almost 73,000,000 Japanese live in an area smaller than that of the state of California) there has been little development of livestock and dairy farming, and only a comparatively small number of Japanese of the more well-to-do classes regularly eat meat and milk products. There were 1,431,920 horses in Japan in 1936, but this number may have diminished because of requisitions for the needs of the army. Other kinds of livestock in Japan in 1938 were as follows: cattle, 1,894,261; swine, 1,140,479; sheep, 114,000; goats, 281,741. The total value of agricultural production in Japan in 1938 was 4,876,674,000 yen, more than double the figure at the depth of the economic depression in 1931; but rising prices accounted for much of this increase in value. After the beginning of the war with China in July 1937 the wholesale price index in Japan increased by 47%, the retail price index by 63%.

Manufacturing.—There were 112,332 factories employing more than five persons each in Japan in 1938, with 3,604,283 workers and employees and an output of production valued at 19,667,219,686 yen. Hand or cottage industries, employing five or less persons, play an important part in Japan's

economy and probably give employment to 3,000,000 people. Very interesting and significant, in connection with Japan's plunge into all-out war with the west, was the growth, absolute and relative, of three branches of industry most closely connected with the manufacture of munitions, the metal, the machine tools and the chemical. The metal industry, for instance, produced goods valued at 431,438,000 yen in 1931; this figure leaped more than tenfold, to 4,687,166,000 yen, in 1938. The machine tools industry went up from 498,014,000 yen to 3,821,881,000 yen during the same period. Chemicals rose from 816,559,000 yen to 3,460,581,000 yen. These three branches of industry, all adaptable to war uses, accounted for 61.3% of the total Japanese industrial output in 1938, as against 33.7% in 1931. The proportion had increased still further by 1941. Between 1938 and 1940 producers' goods increased by more than 10%, while there was a drop of almost 20% in the output of consumers' goods.

Mineral Production.—Japan is not a rich country in natural resources. Its principal minerals are coal (41,803,000 tons, produced, with a value of 305,537,000 yen); gold (22,235 kg.; value, 74,828,000 yen); copper (77,973,000 kg.; value, 66,617,000 yen). These figures are all for 1936, because a ban was imposed on the publication of figures of output after that year. There have been experiments with extracting oil from shale in Manchoukuo and with manufacturing oil from coal in South Sakhalin. Jarvis Island: *see* SOUTH SEA AND EQUATORIAL ISLANDS.

Java. First in population and resources, although fourth in size among the islands of the Dutch East Indies archipelago, Java is the most densely populated land in the world. With the adjacent small island of Madura it contains an area of 51,000 sq.mi. If the official estimate of 48,416,000 as the population in 1940 was correct, there were 949 inhabitants to the square mile. The volcanic soil of Java makes the island extremely fertile, and there was formerly a tendency to concentrate on the economic development of Java and pay relatively little attention to the so-called Outer islands. Harold Butler, former director of the international labour office at Geneva, described the countryside of Java as "an unending village surrounded by its laboriously tilled little fields and groves save where the plantations intervene." The inhabitants of Java are mostly Malays of the Mohammedan faith. Population pressure had made itself felt in Java, especially after the world depression of 1929–33, when the sales and value of the island's sugar crop and of some of its other export products declined disastrously. The Dutch authorities approached the problem from two angles: They tried to promote migration from Java with agricultural settlement in the Palembang district of Sumatra, in Celebes and in south-east Borneo. Later there was a drive for industrialization, stimulated both by the cutting off of communications with Europe and by the needs of defense. Some large foreign firms, including General Motors and Unilever, maintain plants in Java. What were formerly repair shops developed in some cases into metal and machinery works and it became possible to assemble in Java the parts of planes which were imported from abroad. Road rollers, tea-driers and some machinery for the rubber industry are produced locally. Ship repairing has been undertaken in Surabaya and Batavia, and factories for the manufacture of aluminum, scrap iron, paper, cement, glass and rubber were in operation or under construction in 1941. In normal times Java attracts a number of tourists because of the striking mountain scenery and the picturesque, colourful life of the natives. JEWISH RELIGIOUS SERVICES were held in the open air during 1941 in the bombed ruins of the Aldgate synagogue in London

Jewish Religious Life. With Jews virtually debarred from normal social, cultural and economic life, with mass arrests, deportations, expropriations, evictions, suicides and massacres of Jews, with ever more synagogues closed or bombed, Jewish religious schools and seminaries destroyed and rabbis killed, Judaism on the continent of Europe was crushed to new depths of misery. The cruelest suffering was in Poland, where a great religious community was caught in a death trap of hopelessness, starvation and massacre. Nevertheless, there was renewed religious and cultural activity amidst the disease, hunger and death of the nazi-sealed ghettoes.

The important centres of Jewish religious life were no longer in Europe but in the United States and in Palestine. Some rabbinical students, refugees from destroyed communities in Lithuania, reached Canada and Palestine from Japan. But the spread of World War II made the rescuing of refugees so heart-breakingly difficult that many sought escape through suicide, and some through baptism.

To some extent relieving this picture of gloom, refugees brought a certain reinvigoration of synagogues and Jewish religious life to Latin America. Figures released during the year show that while in the decade 1926 to 1936 the Jewish population in the United States increased by 13.7%, the number of synagogues increased by 19.6%. The very horror of the war scene evoked noble utterances from those who put their faith in religion. Thus the pope declared that "For the church there are neither heathens nor Jews, but only the children of God." When the synagogue in Marseilles was destroyed by collaborators of the gestapo, the Catholic bishop of the city took occasion to visit the local rabbi as a public demonstration of his sympathy, just as when the cathedral of St. Sophia in Salonika was bombed, the rabbinical council of that city donated 50,000 drachmas toward its repair.

Finally, the statement made on Oct. 5 by Vice-Commissar Lozovsky that religious freedom existed in Russia took on somewhat more plausibility for Jews who remembered that a few days earlier, for the first time since the communist campaign of militant atheism, the Russian government allowed a Hebrew broadcast to the Jews in the soviet union from the chief rabbi and other leaders of Palestine Jewry. This broadcast opened with the Jew's declaration of undying faith, "Hear, O Israel, the Lord is our God, the Lord is One." (*See* also ANTI-SEMITISM.)

(D. DE. S. P.)

Jewish Welfare Board. The Jewish Welfare board is a member organization of the United Service Organizations for National Defense (USO). It was formed on April 9, 1917, to provide religious and morale needs of the men in the military forces of the United States. It continued this work ever since, with a greatly expanded program during World War II. The board has also continued to serve veterans of World War I and their families and members of the CCC. In all its welfare activities for men in uniform, the board has the co-operation of 34 national Jewish organizations comprising the leading religious, cultural and fraternal groups. In accordance with the regulations of the war and navy departments, the Jewish Welfare board has the authority to give ecclesiastical endorsement of rabbis who apply for service as chaplains with the armed forces.

The board is also the parent body of 325 Jewish community centres in the United States and Canada. These organizations were in 1941 located in more than 200 cities and had a membership of more than 400,000 men, women, young people and children. They conducted many social, cultural and recreational activities in buildings especially constructed for the purpose.

The board served these organizations through a field staff and specialists in program planning. It likewise aided in the activities of the regional organizations of the local centres. These bodies, closely integrated with the national organization, operated in metropolitan New York, New England, New York state, New Jersey, middle Atlantic states, midwest and the Pacific coast. A regional organization covering the southern states was in process of organization in 1941. The board is responsible for recruiting, training and placement of professional workers and co-operates with their professional society, the National Association of Jewish Center Workers.

The 1941 annual meeting of the board was held in Chicago, May 24, 25 and 26. The 1942 annual meeting was planned to be held April 11, 12 and 13, commemorating the 25th anniversary of the organization. The president of the board in 1941 was Frank L. Weil. John M. Schiff was chairman of its army and navy committee, and Louis Kraft was the executive director. The offices of the board are located at 220 Fifth avenue, New York city.

(F. L. W.)

Jews, Distribution of. In view of the fact that in several of the countries where the largest numbers of Jews were living in 1941 the census did not contain any questions regarding religion, and that in other countries, especially in Asia, no exact census existed, the exact number of Jews in the world in 1941 could not be ascertained. The definition of persons falling under the classification of "Jewish race" is in no way agreed upon. Several fascist countries in Europe which have introduced discriminatory legislation against the "Jewish race" have defined that term in different ways. In countries where the census includes questions of religious allegiance, even this religious criterion of Jewish faith is difficult to define exactly. Thus the estimates which generally vary around the figure of 16,000,000 for the Jews cannot claim any foundation on exact figures.

To this uncertainty about the number of Jews in the world was added in recent years a growing uncertainty about their numerical distribution in the different countries and continents. Events since 1933 have led partly to a decrease in the number of Jews as a result of a conscious policy aimed at their extermination, partly to a great shift in their distribution all over the world as the result of large enforced migratory movements. The national socialist legislation in Germany was introduced to a varying degree by conquest into Austria, Czechoslovakia, Poland, Norway, the Netherlands, Belgium, France, Yugoslavia, Greece, and was imitated in fascist countries like Italy, Hungary, Rumania and Bulgaria.

World War II directly involved the two eastern European countries with the largest Jewish population, Poland and the soviet union, where probably more than 6,000,000 Jews lived. The heavy hand of the conqueror was especially felt by the Jewish population of the conquered countries. Probably more than 1,000,000 perished as a result of war, mass persecution and starvation; the others were deprived of all means of economic livelihood and of cultural self-expression and faced a slow process of extermination. The new national socialist administration in Germany forced large migration of the Jews, uprooted whole populations from their historical seats of residence and changed whole districts, with a formerly relatively dense Jewish population, to districts entirely without any Jewish inhabitants. The movement of Jewish emigration overseas was considerably slowed down in 1941, both by the difficulties of obtaining exit permits and immigration visas and by the disruption of communications and the practically complete stoppage of transatlantic passenger traffic.

The number of Jews in the United States may be estimated at about 4,770,000, of whom about 4,300,000 were living in the northern states including the District of Columbia, Maryland and Delaware, 230,000 in the south, 220,000 in the west. The Jewish population of New York was estimated at 2,035,000. The number of Jews in Great Britain is 300,000, in Argentina 270,000, in Canada 150,000, in Cuba, 8,000, in Mexico 20,000 and in Brazil 50,000. All these figures are estimates. In Asia there were in 1941 about 900,000 Jews, of whom 500,000 were in Palestine; in Africa 600,000 Jews of whom more than 400,000 were in northern Africa. (*See* also ANTI-SEMITISM; REFUGEES.) (H. Ko.)

Johns Hopkins University, Baltimore, Md.; president, Isaiah Bowman, Ph.D., LL.D. Enrolment for 1941 in the several schools of the university was as follows: school of higher studies of the faculty of philosophy, 240; engineering, 364 (including 25 graduate students); arts and sciences, 328; business economics, 72; medicine, 302 (10 arts as applied to medicine); hygiene and public health, 126. Enrolment in the afternoon and evening courses was 2,685 and in the summer school, 743. At the end of the fiscal year the endowment of the university was valued at $30,907,474.27 and income from all sources for the year was $2,965,987.93. In the school of medicine Dr. Alfred Blalock was appointed professor of surgery to succeed the late Dr. Dean Lewis; Dr. John C. Whitehorn became professor of psychiatry, succeeding Dr. Adolf Meyer. In the faculty of philosophy Dr. Charles R. Anderson became associate professor of American literature. Dr. Anderson was to spend his first year in residence preparing a complete edition of the works of Sidney Lanier, the southern poet whose career was closely associated with Johns Hopkins. Mergenthaler Hall, a modern biological laboratory, was completed for the opening of the academic year. It provides facilities for expansion of the program of teaching and research in the biological sciences. (I. Bo.)

Johnson, Amy (1903?–1941), British aviatrix and heroine of many spectacular flights. She won acclaim in 1930 for her solo flight from England to Australia. In the summer of 1931 she made a record round-trip flight from London to Tokyo and in 1932 she flew from Lympne, England, to Cape Town in 4 days 6 hr. and 56 min. With her husband, Capt. James A. Mollison, she crossed the Atlantic in July 1933, flying from England to Bridgeport, Conn., where their plane was forced down, in 39 hr. After Britain went to war in 1939, she joined the auxiliary transport service. She lost her life in the line of duty when her plane crashed Jan. 5 over the Thames estuary.

Jones, Howard Harding (1885–1941), U.S. football coach, was born Aug. 23 in Excello, Ohio. He graduated in 1905 from Phillips Exeter academy, and in 1908 from Yale university, where he starred in baseball and football. His first coaching assignment was at Syracuse university in 1908, followed by assignments at Yale, 1909; Ohio State university, 1910–13; Yale 1913–16; University of Iowa, 1916–23; Duke university, 1924. From 1925 until his death, he was coach at the University of Southern California. Together with Knute Rockne and Glenn ("Pop") Warner, Jones was known as one of the game's great strategists. He compiled a lifetime record of 120 victories and 13 ties against 36 defeats. He died at North Hollywood, Calif., July 27.

Jones, Jesse Holman (1874–), U.S. secretary of commerce, was born in Robertson county, Tenn., on April 5. At Dallas, Tex., in 1895 he became manager of a lumber company and seven years later organized his own firm. In 1909 he established the Texas Trust company of Houston, later the Bankers Mortgage company. He also engaged in extensive real estate operations and bought control of the Houston *Chronicle*, of which he is publisher. President Hoover appointed him a director of the Reconstruction Finance corporation in 1932 and he became chairman the following year. In July 1939, pursuant to the regrouping of governmental agencies under the president's reorganization plan, Jones was appointed administrator of the Federal Loan agency. On Sept. 13, 1940 President Roosevelt nominated him secretary of commerce to succeed Harry L. Hopkins (*q.v.*), after congress had enacted a special law permitting Jones to retain the office of federal loan administrator. The senate confirmed this nomination the next day and he was sworn in Sept. 19, 1940. In the defense program of 1940 and 1941, Jones held an all-important position, since it was through the Federal Loan agency and RFC that most of the additions to plants and industries working on defense orders were financed.

Joyce, James (1882–1941), Irish author, was born Feb. 2 in Dublin. He showed a decided literary bent at the age of nine when he wrote a political tract denouncing anti-Parnellites. At 20, Joyce left Dublin for Paris, where he intended to study medicine, but he wrote short stories instead. Many of them were collected in a book called *Dubliners*, published in 1914. The Irish were so incensed with Joyce's unflattering descriptions of them that they burned the book in a Dublin public square. When war broke out in 1914, Joyce and his wife, then in Austria, moved to Zurich, Switzerland. His novel, *Ulysses*, published in Paris in 1922, was promptly banned in Great Britain and Ireland. Its sale was also prohibited in the United States until 1933, when Judge John Munro Woolsey ruled the book was not obscene and ordered the ban lifted. His last work, *Finnegans Wake*, parts of which appeared as *Work in Progress*, was published in May 1939. It was distinguished by the use of bizarre words coined by Joyce, who knew 17 languages, ancient and modern. He died Jan. 13 in a Zurich hospital. See *Encyclopædia Britannica*.

Just, Ernest Everett (1883–1941), U.S. zoologist, was born Aug. 14 in Charleston, S.C., of Negro parentage. He studied at schools in the south and then moved to the north, where he was graduated from Dartmouth in 1907 with high honours in zoology and history. He was associated with Howard university, Washington, D.C. after 1907 and was zoology professor there from 1912 until his death. In 1915, he was awarded the Spingarn medal for his work in improving the standards of Negro medical schools. Dr. Just's research in cell biology won international recognition and he wrote extensively on the subject. He was a fellow of the American Association for the Advancement of Science, vice-president of the American Society of Zoologists, 1930; vice-president of the American Ecologists, 1930; and associate editor of a number of scientific reviews. He died Oct. 27 in Washington, D.C.

Justice, U.S. Department of: *see* GOVERNMENT DEPARTMENTS AND BUREAUS.

Jute. India, which produces almost the entire world's supply of jute, cut the area planted in 1941 to 2,212,600 ac., only a little more than half the record planting of 4,112,750 ac. in 1940, when a record crop of 12,600,000 bales (400 lb. to the bale) was produced. In Bengal, which produces 80% to 90% of India's jute, planting in 1941 was restricted by law to one acre in three, as compared with 1940. The 1940 record crop left a large carry-over of jute after the heavy British demand for jute bags for war purposes had been largely satisfied. Scarcity of cargo space also limited shipments, and prices of burlap in the United States in the autumn of 1941 were about 50% to 70% higher than in the same period of 1940. At the request of the Office of Price Administration, the United States department of state began negotiations with the Indian government to control the rise in prices. In Brazil, which uses annually about 15,000,000 bags made of jute (1½ yd. of jute to the bag) for coffee shipments, a subsidized effort was begun to develop native fibres as substitutes. Five fibre plants were found to be suitable, and were under experimental cultivation in 1941. The five plants are paco-paco, juta indiana, malva veludo, gauzima and papoula de São Francisco. All jute materials manufactured in Brazil must contain at least 10% native fibres. In Colombia a fibre plant, fique, which is similar to sisal, was extensively used as a substitute for jute and sisal in 1941. Efforts were being made to produce fique in exportable quantities. (S. O. R.)

Juvenile Delinquency. In 1940 in the U.S. there was a decrease in juvenile delinquent cases disposed of by the 375 courts reporting to the children's bureau. In 1939 the number was 80,840. In 1940 it was 77,008. Juvenile court statistics are uniformly reported on a state-wide basis from 8 states and from 35 courts in 19 other states, and from the District of Columbia. The advantage of uniform reporting was gradually being recognized in an area that included 38% of the population of the United States.

White children were involved in 78%, Negro children in 22%, and children of other races in less than 1% of the cases of juvenile delinquency disposed of by juvenile courts in 1940.

Sex discrimination continued to be evident: About 23% more girls than boys were committed to correctional institutions, though the total number of girl offenders arrested was approximately one-fifth that of the boys.

The National Conference of Juvenile agencies and the American Prison association had an agreement that, beginning in 1942, their annual meetings should be known as the Congress of Correction. A group of leaders in the correctional field believed that this was an important administrative advance. The co-ordinating council movement expanded. Before 1930 there was one council, in Berkeley, Calif. In 1941 there were more than 600 in more

than 20 states. The co-ordinating council might be defined as a co-operative organization of public officials and private citizens designed to improve the community for the welfare of children.

The Osborne association completed a study of institutions for young offenders. This up-to-date information was expected to be helpful to all students of the field.

Burgess stressed the need for a better co-operation between the community and juvenile parolees. ("Crime Prevention and National Defense," *Proceedings of the National Conference of Juvenile Agencies*, 1941, pp. 37, 83–94.) (*See* also CRIME.)

Kansas. A central state of the United States, admitted Jan. 29, 1861; popularly known as the "Sunflower state." Total area, 82,276 sq.mi., of which 82,113 sq.mi. are land; pop. 1940, 1,801,028, a decrease of 79,971 or 4·3% from 1930. In rank the census placed the state 29th in comparison with 24th in 1930. Capital, Topeka (67,833). The two larger cities were Kansas City (121,458) and Wichita (114,966). Of the state's population in 1940, 753,941 were urban or 41·9%; 96·3% were white, 3·7% Negro, 3·0% foreign born.

History.—In the biennial election of 1940 all executive officers, Republicans, were re-elected, together with a Republican legislature: Payne H. Ratner, governor; Carl E. Friend, lieutenant governor; Frank J. Ryan, secretary of state; George Robb, auditor; Walter E. Wilson, treasurer; Jay S. Parker, attorney general; George L. McClenny, superintendent of public instruction; Charles F. Hobbs, commissioner of insurance; William C. Austin, state printer.

The legislature of 1941 enacted the largest body of laws of any single session since 1905: 401 bills and joint resolutions. The new school code and part of the tax code failed of passage. Among the more important laws enacted were the teachers retirement plan, the merit system, re-enactment of the interstate oil compact, ratification of the Republican river tri-state compact, authorization of a state committee on interstate co-operation, permission to counties to receive lump-sum payment from the United States in lieu of taxes on government projects, safeguarding of absentee voting, flood control, drainage and irrigation laws, outlawing of communistic and similar parties, prohibiting labour unions from discriminating against Negroes, creation of a state home guard, authorization of a state council of defense and redistricting of the state into six instead of seven congressional districts.

The defense effort in 1941 boomed the aircraft industry in Wichita. Defense plants were under construction at Kansas City, Parsons and Pittsburg.

Education.—The state had, in 1941, more than 200 public libraries, of which more than half were tax-supported. The enrolment in public and parochial elementary and secondary schools declined from 460,036 in 1930 to 423,166 in 1938; the number of teachers from 19,141 to 17,282. The high school enrolment, public and private, in 1938 was 111,704. The collegiate enrolment (all schools) was 24,550 in 1938; 24,814 in 1940–41; 21,706 in Sept. 1941, or a decline of 12.5% from the previous year. The 14 junior colleges lost most heavily, 21.7%; the 7 private two-year colleges 19.9%; the 21 four-year schools 9.87%.

Communication.—The state had 9,349 mi. of primary and 9,862 of rural highways; 8,667 mi. of railroads and 342,277 telephones in 1939.

Banking and Finance.—As of Dec. 30, 1939, there were 680 active banks, 182 of which were national, with total deposits of $400,000,000. Savings banks held $78,400,000 of deposits. The legislature in 1941 voted a budget of $19,106,794 for the biennium 1941–43, divided about equally between the two years.

Agriculture.—The year 1941 was favourable to crops, with above normal rainfall and temperature, marred in some localities by floods and losses on account of wet harvests. Yields per acre for most crops were above those of 1940. The hay crop was greater than that of 1940 and above the 10-year average for 1930–39; some alfalfa was cut five times. Feed grain supplies were the largest in 1941 since 1932–33; hay and roughage the highest in 12 years except 1940. The wheat crop was 173,332,000 bu., compared with 126,553,000 bu. in 1940 and a ten-year average of 131,581,000 bu.; it was the third largest crop in the history of the state. Corn production was 57,224,000 bu., compared with 42,353,000 bu. in 1940 and the ten-year average of 59,550,000 bu.; the acre yield was 23 bu., highest since 1928. The oat crop was below that of 1940, but barley was a record production. The grain sorghum yield was the highest per acre since 1928, and the sweet sorghum forage the highest on record.

Manufacturing.—The total value of manufactures in 1939 was $464,353,506; in 1937, $543,807,190; wages paid were $36,928,000 in 1939 and $40,513,398 in 1937. The five principal industries were meat packing, petroleum refining, flour, chemicals and creamery butter, rated according to value of their products.

Mineral Production.—The total value of mineral production in Kansas in 1939 was $123,391,521, as compared with $129,675,438 in 1938. In 1941, the petroleum industry in the west central part of the state was operating at top production to meet defense needs.

Principal Mineral Products of Kansas, 1939 and 1938

Mineral	Value, 1939	Value, 1938
Petroleum	$63,100,000	$72,100,000
Natural gas	29,356,000	27,485,000
Zinc	7,172,084	7,010,304
Cement	5,614,112	4,949,018
Coal	5,400,000	5,263,000
Stone	4,550,560	4,958,723

(J. C. MN.)

Kaspar, Karel (1870–1941), Czech cardinal, archbishop of Prague and primate of Bohemia, was born May 16 at Mirosov, Bohemia. He studied for the priesthood at the University of Pope Urban in Rome and later studied law at the University of St. Apolinare in Rome. He was named bishop of Kralove Hradec, Czechoslovakia, in 1921 and ten years later was appointed archbishop of Prague and head of the Catholic chaplains in the Czechoslovak army. An authority on canon law and a noted writer and theologian, he was named cardinal by Pope Pius XI in 1935. In Oct. 1938, Cardinal Kaspar denounced the Munich pact as an "injustice" imposed on the people of Czechoslovakia. He died in Prague, April 21.

Keitel, Wilhelm (1882–), German army officer, born Sept. 22, was a commander of artillery during World War I. On April 1, 1934, he was promoted to major general and the following year, when Germany introduced conscription, he took charge of the personnel section (*Wehrmachtsamt*) in the war ministry, and was thus connected to a certain extent with the reoccupation of the Rhineland in 1936, and with the dispatch of German reinforcements to Nationalist Spain. In Feb. 1938, during Hitler's "army purge" of Gen. von Blomberg and other conservative members of the high command, Gen. Keitel was appointed chief of the supreme command of the German armed forces. He thus directed operations against Poland, Norway, the Netherlands, Belgium, France and Britain in 1939 and 1940. On June 22, 1940 he signed the German-French armistice and on July 19 he was created field marshal by Adolf Hitler. In the various campaigns of 1941, Keitel's name was not prominently mentioned, although he continued to direct operations of the German forces. Prominence instead fell upon his subordinates in the army, such as Brauchitsch, Leeb, Rundstedt, Bock, Rommel (*qq.v.*). Reports that he had been demoted or dismissed during the Russian campaign were denied by the German radio and had not been substantiated at the end of the year.

Kelly, Colin P., Jr. (1915–1941), U.S. army flier, was born July 11 in Madison, Fla. He was graduated from West Point in 1937, commissioned as a second lieutenant of infantry, and on his own request was assigned to the army air corps. After completing training courses at Randolph and Kelly fields, he was assigned to the 19th bombing squadron at March field, Calif. In Sept. 1940, he was promoted to the rank of captain and he was stationed in the Philippines when

the U.S.-Japanese war broke out Dec. 7, 1941. On Dec. 10, Capt. Kelly sighted the 29,330-ton Japanese battleship "Haruna" off Aparri on the Luzon coast. He scored three direct hits on the ship, which later sank. While returning to his home air base, his plane was set on fire by two enemy craft and he ordered his crew to bail out. Six of his men were saved, but Capt. Kelly was killed in the resulting crash. The first U.S. air hero of World War II, he was posthumously awarded the Distinguished Service cross by the U.S. Far Eastern command.

Kenny Treatment: *see* INFANTILE PARALYSIS.

Kentucky. An east south central state of the United States, admitted June 1, 1792, popularly known as the "Blue Grass state." Area, 40,395 sq.mi. (286 sq.mi. water), pop. (1940) 2,845,627, of which 1,996,300 or 70·2% was rural and 849,327 or 29·8% urban. Negroes constituted 214,031 or 7·5%; and 15,631 were of foreign birth. Capital, Frankfort (11,492); largest city, Louisville (319,077). Other cities include Covington (62,018); Lexington (49,304); Owensboro (30,245); Paducah (33,765); Ashland (29,537).

History.—In the state election of Nov. 4, 1941, the voters returned a general assembly overwhelmingly Democratic: 75 Democrats in the lower house of 100 members, 29 Democrats in the senate of 38 members. Two constitutional amendments were adopted, the first providing "that the General Assembly may by general law distribute not to exceed 10% of the school fund on other than a census-pupil basis." The vote on this was 312,986 for, and 53,924 against. The second authorized any county to use voting machines at its own expense (176,596 votes for, 70,017 against). The chief officers of the state in 1941 were Keen Johnson, governor; Rodes K. Myers, lieutenant governor; Hugh Meredith, attorney-general; E. E. Shannon, treasurer; John W. Brooker, superintendent of public instruction; W. H. May, commissioner of agriculture.

Education.—There were, in 1940, 460,953 pupils in 6,621 elementary schools, with 13,694 teachers. In 683 high schools there were 5,958 teachers and 131,546 pupils. On April 1, 1941, Herman L. Donovan became president of the University of Kentucky, which had a total enrolment in 1940 of 6,242, of whom 2,850 registered in the summer session. The teaching staff of the State Teachers college at Bowling Green numbered 108; at Richmond, 87; at Murray, 84; at Morehead, 68.

Public Welfare, Charities, Correction.—Public assistance increased steadily. Old-age pensions in 1940 required $5,190,047; in 1941, $6,195,166; the number of beneficiaries rose from 591,315 to 688,509. A law of 1940 extending aid to the needy blind was declared unconstitutional. The correctional institutions in 1941 were the La Grange reformatory, Eddyville penitentiary, Greendale Houses of Reform for juvenile offenders and a women's prison in Shelby county.

Communication.—The highways of Kentucky in 1941 constituted 8,593 mi. under state supervision. Expenditures in the fiscal year 1940–41, raised largely by taxes on gasoline and motor vehicles, amounted to $19,686,952. There was one large airport in the state (Bowman field, Louisville) while another at Lexington was to be opened in 1942. Railway mileage was 3,723 mi.

Banking and Finance.—There were 314 state banks with deposits of $225,056,000 in 1941, while the deposits of 95 national banks were $257,892,000. In the fiscal year 1940–41, the general state expenditures were $24,680,350, exclusive of bridge and road improvement funds. Receipts were $30,836,809. The state debt of $4,097,000 (Dec. 1940) was entirely eliminated and Kentucky had its first surplus since 1904—$1,980,075.

Gross income from farm crops in 1940 was $199,684,000, to which the U.S. government added $13,318,000 in payments to farmers. Cash income from livestock was $72,434,000. The reduction in volume of agricultural products in 1941 was due to diminished rainfall during a period of 17 months in 1940–41.

Manufacturing.—In 1937 there were 1,624 establishments with 68,998 wage earners and an output valued at $504,897,000.

Mineral Production.—The total value of mineral production in Kentucky was $113,243,154 in 1939, as compared with $106,654,903 in 1938.

Table I.—*Leading Agricultural Products of Kentucky, 1941 and 1940*

Crop	1941	1940
Corn, bushels	73,400,000	70,400,000
Wheat, bushels	5,625,000	4,071,000
Oats, bushels	1,722,000	1,400,000
Barley, bushels	2,825,000	1,825,000
Hay, tons	1,591,000	5,629,000
Irish Potatoes, bushels	3,901,000	4,140,000
Tobacco (all types), pounds	285,240,000	338,477,000

Table II.—*Principal Mineral Products of Kentucky, 1940 and 1939*

Product	1940	1939
Coal	49,383,303 tons	42,310,995 tons
Gas	45,000,000,000 cu. ft. (est.)	
Petroleum	5,191,025 bbls.	5,518,089 bbls.

Kenya: *see* BRITISH EAST AFRICA.

Kerrl, Hanns (1887–1941), German politician, was born Dec. 11 in Fallersleben, Germany. He was made minister of justice when Hitler came to power in 1933 and became minister without portfolio in 1934. In 1935, he was appointed minister for church affairs. Kerrl was a leader of the nazi effort to establish full state control over the church, and his order in 1935 suppressing the Protestant professional synods resulted in considerable opposition from German churchmen. Although Kerrl was a virtual dictator of the German churches, many clergymen refused to recognize his authority, notably Pastor Martin Niemoeller, whose opposition to nazi measures led to his imprisonment. Kerrl died in Berlin, according to a Berne dispatch of Dec. 14.

Kidd, Isaac Campbell (1884–1941), U.S. admiral, was born March 26 in Cleveland, Ohio, and was graduated from the naval academy in 1906. After serving on several U.S. warships, he returned for duty at the naval academy, 1916–18, and became flag lieutenant and aide on the staff of the commander-in-chief of the Atlantic fleet in 1919. He was made chief of staff and aide commander of battleships of the battle force in Feb. 1940 and was appointed rear admiral in July of the same year. Kidd served as aide on the staff of Admiral Husband E. Kimmel (*q.v.*) with the Pacific fleet and was in command of a battleship division during the surprise attack on Pearl Harbor, Hawaii, Dec. 7, 1941. He died when his battleship, the 32,600-ton "Arizona," was sunk by the Japanese. He had been awarded the Cuban Pacification medal, the Mexican Service medal, the Victory Fleet medal and the Atlantic Fleet clasp.

Kidnapping. As in previous years, kidnappings in China and in Palestine during 1941 were of a particularly striking character. In Shanghai several such cases culminated in the seizure of nine Central Bank of China employees on April 17, and were attributed to a new outbreak of the terrorism occurring during March. In September, Mrs. Denzil Clark, Japanese-born wife of a British embassy press attaché, was kidnapped and held by Japanese extremists until freed nine days later through the intervention of Japanese authorities.

On May 4, wholesale kidnapping of Jewish leaders by Arab nationalists was reported in Palestine. It signalized the Arab reaction to events in the Balkans and Mesopotamia and particularly to the mass arrival of Jewish immigrants from the Balkans.

Strangest case of the year in the United States was the attempted kidnapping of ex-Governor E. D. Rivers of Georgia on Oct. 2. Gov. Rivers and his wife were severely beaten by H. W. Bikle, Jr., a former school teacher. Investigation showed evidence of an intent to kidnap induced by psychopathic disturbances in the assailant who committed suicide shortly after his plan was frustrated.

The support extended in 1940 by U.S. Attorney-General Robert H. Jackson to the proposed statute authorizing police to have recourse to wiretapping in kidnapping investigations had further repercussions in 1941. Director J. Edgar Hoover of the federal bureau of investigation presented the case for the proposed statute on Feb. 18 and Pres. Roosevelt gave his endorsement on Feb. 26. U.S. Attorney-General Biddle likewise backed the bill on Oct. 9.

The record of kidnappings in the United States from the enactment of the Federal Kidnapping act in 1932, to Dec. 31, 1941, showed no marked trends. Unusually high levels were reached in 1936 and 1938, with 1932, 1933, 1940 and 1941 occupying the lower end of the scale. Available figures for a ten-year period appear in Table I.

Since the federal bureau of investigation was accorded concurrent jurisdiction with state and local police in kidnapping investigations, that agency

Table I.—*Kidnappings Investigated in U.S., 1932–41*

Year	*Total Number of Kidnappings*	*Number Wherein Ransom Demanded*
1932 (from June 22)	5	5
1933	14	10
1934	18	5
1935	26	1
1936	31	1
1937	20	4
1938	37	5
1939	20	0
1940	12	1
1941	9	0

has participated in 211 cases, all but two of which have been solved; 430 convictions have been secured, involving 12 death sentences and 43 of life imprisonment. Nine kidnappers committed suicide, eight were killed by law enforcement officers, seven were murdered by accomplices, and two were lynched. All of the cases investigated during 1941 were solved. Fifteen convictions were secured, totalling 162 years of penal servitude, and 26 fugitives who had been sought for some time were finally apprehended and convicted during this twelve-month period.

Great Britain.—Official reports of kidnapping in England are confined to stealing children under 14 years of age. The record since 1900, summarized to the latest date for which official reports are available, appears in Table II.

Table II.—*Record of Kidnappings in England since 1900*

Five Year Averages		*Annual Totals*	
1900–1904	15	1935	4
1905–1909	10	1936	3
1910–1914	7	1937	7
1915–1919	8	1938	5
1920–1924	4		
1925–1929	4		
1930–1934	5		

The total of 19 kidnappings therein shown for the years 1935–1938 inclusive is far above the record for any of the five-year periods between 1905 and 1934. Extreme emergencies due to war have prevented the publication and dissemination of the record of kidnappings in England and Wales for the years subsequent to 1938. (*See* also FEDERAL BUREAU OF INVESTIGATION.)

BIBLIOGRAPHY.—Federal Bureau of Investigation, *Annual Report* (1940–41), also *Law Enforcement Bulletin* (monthly, 1941); *Criminal Statistics, England and Wales, 1938* (London, 1940). (BR. S.)

Kimmel, Husband Edward (1882–), U.S. naval officer, was born at Henderson, Ky., on Feb. 26. He attended Central university in 1899, and was graduated from the U.S. Naval academy in 1904. Commissioned ensign in 1906, he rose through the ranks, serving as a special aide to Franklin D. Roosevelt, then assistant secretary of the navy, in 1915. He was promoted to the rank of rear admiral in 1937, and in 1939 he commanded three cruisers on a good-will tour of South America. On Feb. 1, 1941, he succeeded Adm. James O. Richardson as commander in chief of the Pacific fleet, with additional duties as commander in chief of the U.S. fleet, and was raised to the rank of admiral. On Dec. 17, 1941, Adm. Kimmel was relieved of his command, less than 48 hours after Secretary Knox stated that the U.S. land and sea forces "were not on the alert" during the Japanese attack on Pearl Harbor, Dec. 7.

King, Ernest Joseph (1878–), U.S. naval officer, was born Nov. 23 in Lorain, O. He left Annapolis to serve in the Spanish-American War, returning to the naval academy to graduate in 1901. During World War I he was assistant to the chief of staff of the commander in chief of the U.S. fleet. He qualified as a naval aviator in 1927 and was chief of the bureau of aeronautics, 1933–35. In 1933 he was promoted to rear admiral and he was vice-admiral in command of the fleet's aircraft battle force, 1938–39.

On Feb. 1, 1941, Adm. King was made commander of the Atlantic fleet and on Dec. 20, 1941, 13 days after the Japanese attack on U.S. possessions in the Pacific, he was designated commander in chief of the U.S. fleet, in what was apparently a shake-up in navy organization as well as personnel. In his new post, King outranked the chief of naval operations, was made responsible only to the president and the secretary of the navy, and assumed supreme command of all U.S. naval operating forces in Atlantic, Pacific and Asiatic waters.

King, William Lyon Mackenzie (1874–), Canadian politician, was born at Berlin (now Kitchener), Ont., Dec. 17. His grandfather, William Lyon Mackenzie, had been prominent in the struggle for political freedom in 1837. King entered parliament in 1908, became leader of the Federal Liberal party in 1919, and was returned to office as prime minister for the third time on Oct. 23, 1935. Shortly after Canada entered World War II, King's foes charged him with negligence and incompetence in handling the war effort. But the country did not support this view, and in March 1940 his party won a landslide election, adding 25 seats to its parliamentary majority. In Aug. 1940, when a nazi invasion of Britain appeared imminent, the Canadian prime minister conferred with President Roosevelt, and both agreed to set up a permanent joint board of defense to study common defense problems. The fruit of another parley with President Roosevelt on April 20, 1941, was a U.S.-Canada pact for co-operation in producing war materials for Britain. On Nov. 1, 1941, King and the U.S. chief executive met again to map plans for a concerted policy to speed war aid to the U.S.S.R. On Oct. 18, 1941, King announced his government's decision to control wages and prices, and on Dec. 29 his government decided to cancel the British war debt of $1,500,000,000 that had accumulated for the purchase of war munitions in Canada after 1939. (*See* also *Encyclopædia Britannica.*)

Kittredge, George Lyman (1860–1941), U.S. educator, was born Feb. 28 in Boston, Mass. After graduating from Harvard in 1882, he taught Latin for six years at Phillips Exeter academy. He returned to Harvard as an instructor in 1888, and from 1894 to 1936 he was professor of English. Prof. Kittredge was an authority on Beowulf, Chaucer, Middle English and Anglo-Saxon lore, Sir Thomas Malory and on New England witchcraft. He was awarded honorary degrees by many U.S. and British universities. Among his works are *The Language of Chaucer's Troilus* (1894); *The Mother Tongue* (co-author with Sarah Louise Arnold) (1900); *Words and Their Ways in English Speech* (co-author with Prof. James B. Greenough) (1901); *English Witchcraft and James I* (1912); *Chaucer and His Poetry* (1915); *Gawain and the Green Knight* (1916); *Sir Thomas Malory* (1925); and *Witchcraft in Old and New England* (1929). He died at Barnstable, Mass., July 23.

Kiwanis International. Kiwanis International is made up of 2,163 clubs, with a membership of 112,000 in communities throughout the United States and Canada.

The first Kiwanis club was organized in Detroit, Mich., Jan. 1915. In Canada, the first club was organized in Hamilton, Ont., Nov. 1916. Each club is made up of two representatives from every local business, professional and agricultural classification, united for the rendering of civic and social service to the community. The name "Kiwanis" is a coined word, which receives its real meaning from the constructive, unselfish work of Kiwanians. The motto of the organization is "We build."

The general office is at 520 N. Michigan avenue, Chicago, Ill. President in 1941 was Charles S. Donley, Pittsburgh, Pa.; secretary, O. E. Peterson, Chicago, Ill. (L. H. Ds.)

Knights of Columbus. Special emphasis, because of defense and war programs, was placed upon the traditional slogan of Columbianism, "For God

and Country." Organized in 1882, the order is dedicated to the preservation and the championship of Catholic and traditional American principles. Membership is limited to Catholic men, practically and sacramentally adhering to the precepts of the church.

The total membership, as of June 30, 1941, amounted to 414,952. The net loss during the fiscal year was 4,159. The associate members numbered 196,884; the insurance members 218,068. There were 2,478 local councils, in 48 states, the American territories and possessions, Canada and Latin America. The insurance department reported total assets of $50,137,702.20; total liabilities of $44,455,911.89. Death claims, old-age benefits and other obligations amounted to $4,284,752.86.

The 59th supreme convention was held, Aug. 19–23, at Atlantic City, N.J. Delegates from 60 state and regional jurisdictions attended. Officers re-elected for another term were: supreme knight, Francis P. Matthews; deputy supreme knight, John E. Swift; supreme secretary, Joseph F. Lamb; supreme treasurer, Daniel J. Callahan; supreme advocate, Luke E. Hart. Rev. Leo M. Finn was reappointed supreme chaplain.

Remembering the magnificent record of the Knights of Columbus in ministering to the spiritual and material needs of the armed forces during World War I, the order was eager to meet the war conditions. It merged its activities with the National Catholic Community service, set up by the American bishops; the supreme knight was designated chairman of the N.C.C.S.; all jurisdictions, national, state and local, gave full co-operation to the N.C.C.S. and the United Service organizations, and local councils cooperated with civilian defense, service clubs, defense bonds, community and other war activities.

In addition to promoting the fraternal ideals, the order engaged in Catholic action by sponsoring radio programs, promoting study clubs and forums, aiding in the elimination of indecency in motion pictures and publications, combatting anti-Catholic and anti-American forces, intensifying religious observances and celebrations. Notable was the work in developing the Boy Life bureau, through the expansion of the Columbian squires and the training of adult leaders.

National headquarters in 1941 were at New Haven, Conn. *Columbia*, a monthly illustrated magazine, and *News*, a weekly, are the official organs. (F. X. T.)

Knox, (William) Franklin (1874–), U.S. publisher, statesman and soldier, was born Jan. 1 at Boston and was educated at Alma (Mich.) college. He joined Theodore Roosevelt's Rough Riders, with whom he served from April to Sept. 1898. Commissioned a major in 1917, he was in France from May 1918 to Feb. 1919 and became colonel in the 365th field artillery. His newspaper career began shortly after his service in the Spanish-American war, when he was successively reporter, city editor and circulation manager of the Grand Rapids, Mich., *Herald*. From 1901 to 1912 he was publisher of the Sault Ste. Marie, Mich., *News*, and in 1913 he purchased control of the Manchester, N.H., *Union and Leader*. Later he became associated with the Hearst newspaper chain and was its general manager until 1931, when he became publisher of the *Chicago Daily News*. In 1936 Col. Knox was the Republican candidate for vice-president. On June 20, 1940, Knox was appointed secretary of the navy by Pres. Roosevelt.

On March 24, 1941 he declared that the war is "our fight"; on June 30 he urged immediate U.S. entry into the battle of the Atlantic; on Sept. 15 he announced the beginning of U.S. convoys to Iceland; on Oct. 1 he said the U.S. and Great Britain should police the world for at least a century after the axis' defeat in order to prevent a recurrence of German aggression. Aside from his regular duties in Washington, Knox made several inspection tours of U.S. naval bases during the year. In December he flew to Hawaii to determine the exact amount of damage to the U.S. fleet and to Pearl Harbor caused by the Japanese attack on Oahu. Upon his return to Washington Dec. 15 he listed the loss of one battleship, three destroyers, a target ship and a minelayer, and damage to various other vessels. In his report Knox also stated that the naval forces at Pearl Harbor were not on the alert Dec. 7 and that the Japanese attack had been greatly facilitated by "the most effective fifth-column work in this war."

Knudsen, William Signius (1879–), U.S. industrialist, was born in Copenhagen, Denmark, on March 25 and as a youth worked in a bicycle shop in his native town. At the age of 20 he emigrated to the United States, where he found work in a shipyard in New York. After working in a railroad shop, he went to Buffalo, where he ultimately became superintendent of a mill. He then worked for Ford Motor company and became associated with Chevrolet Motor company, of which he was made vice-president in 1922 and later president. From 1933 to 1937 he was executive vice-president of General Motors corporation, and in the latter year he became president. On May 28, 1940 President Roosevelt appointed him commissioner of industrial production for the national defense advisory commission. This position assumed increasing importance during the remainder of the year and although the commission had no chairman with authority until Dec. 20, Knudsen was recognized as its most outstanding member.

When President Roosevelt created the Office of Production Management (*q.v.*) Jan. 7, 1941, he named Knudsen director general. Knudsen continued to be the "top man" in the production phase of national defense until Jan. 1942, but gradually matters of general policy were delegated to other agencies such as the Office of Price Administration, the Supply Priorities and Allocations board (*qq.v.*) and the War Production board. Friction among the various agencies seemed to be inevitable, and on July 23 Knudsen admitted "a little dispute" with the OPA and Leon Henderson (*q.v.*) over the curtailment of motor car production. Knudsen had contended that an arbitrary reduction of 50% would throw thousands out of work and dislocate the U.S. economy.

Koffka, Kurt (1886–1941), U.S. psychologist, was born March 18 in Berlin. He studied at the University of Edinburgh and at the University of Berlin, where he received his Ph.D. in 1908. He taught psychology in German universities and in the U.S. was professor at Cornell, 1924–25, the University of Wisconsin, 1926–27 and Smith college, 1932–41. His treatise, *Die Grundlagen der psychischen Entwicklung* (1921), which appeared in English under the title *Growth of the Mind* (1924), established him as a leading exponent of the Gestalt theory. In 1935 he wrote *Principles of Gestalt Psychology*. Koffka died in Northampton, Mass., Nov. 22.

Konoye, Fumimaro (1891–), Japanese prince and statesman, was born at Kyoto in October, son of Prince Atsumaro Konoye and descendant of one of Japan's oldest families. He graduated from Tokyo Imperial university's law college in 1917 and was a member of Prince Saionji's delegation to the Paris peace conference the following year. After serving in the house of peers he was prime minister in 1937–39 and subsequently minister of state without portfolio and president of the privy council. In July 1940, after the resignation of Adm. Yonai, he again became prime minister. On Aug. 1, 1940 the government announced that it would pursue a totalitarian

policy which would include Japanese domination over Asia, but shortly thereafter Konoye announced that he did not propose to set up a single-party state because "the privilege of assisting the throne cannot be monopolized by a single individual or a single party."

Konoye's ministry in 1941 was generally one of moderation in foreign affairs. In a strange address before the house of representatives Jan. 27 he craved the forgiveness of the emperor and the people for the "billions of yen spent and 100,000 officers and men sacrificed" in the war with China. On April 8 he warned the Japanese against a "blind imitation of foreign ideas" (*i.e.*, fascism) and called for a resurgence of the "traditional Japanese spirit." This point of view did not set well with the army. Konoye resigned July 16 and formed a new cabinet two days later without his foreign minister, Yosuke Matsuoka (*q.v.*), who had been subjected to considerable criticism. The new cabinet lasted only three months, and Konoye was succeeded in October by Hideki Tojo (*q.v.*), who was pledged without reservations to fulfilment of Japanese aspirations in eastern Asia. (*See* JAPAN.)

Korea: *see* CHOSEN.

Korizis, Alexander (1885–1941), Greek statesman and financier, was born April 15 on the island of Poros in the Aegean sea. At 18 he clerked in the National Bank of Greece. He rose from the ranks, instituted many notable economic and social reforms in the realm of agricultural credit, and was appointed governor of the bank in 1939. A close friend of King George II and Premier Metaxas, he was appointed minister of health and social welfare in 1936. Upon the death of Metaxas in Jan. 1941, Korizis assumed the premiership of his country, then at war with Italy. Korizis, however, lacked a military background and broad political experience, and his selection as premier was criticized by many in Greece. A few days after the German invasion in April 1941, it became evident to Korizis that the pitifully small Anglo-Greek forces could not hope to repel the powerful armoured units of the invaders and, depressed over his country's plight, the new premier took his life in Athens, April 18.

Kourkoulis, Methodios (1862–1941), U.S. prelate in the Greek Orthodox church, was born Oct. 26 on the island of Mytilene near the Dardanelles. In 1904 he went to the United States and was appointed dean of the Holy Trinity Greek cathedral in New York city. In 1939 he was invested with the title of grand archimandrite of Istanbul. This office gave him the privilege of taking up residence as dean in any Greek Orthodox monastery. Archimandrite Kourkoulis was twice decorated by the Greek government for his services in raising funds in the United States for aid to the Greek army in the Balkan wars of 1912–13. He died in New York city, April 9.

Krause, Allen Kramer (1881–1941), U.S. tuberculosis expert, was born Feb. 13 at Lebanon, Pa. He was graduated from Brown university in 1901 and in 1907 received his M.D. from Johns Hopkins. From 1909 to 1916 Dr. Krause was assistant director at the Saranac (N.Y.) laboratory, and later returned to Johns Hopkins to direct the Kenneth Dows Tuberculosis Research laboratories and the hospital's tuberculosis dispensary. He was clinical professor of medicine at Stanford from 1929 to 1937 and held a similar post at the University of Southern California from 1932 to 1937. An authority on tuberculosis, Dr. Krause was named managing editor of *The American Review of Tuberculosis* in 1916 and was editor of the journal from 1922 to 1939. He also edited the American section of a British journal, *Tubercle*. Among his books are *Rest and Other Things* (1922); *Environment and Resistance in Tuberculosis* (1923); and *The Evolution of Tubercle* (1927). In 1931 he was awarded the Trudeau medal for tuberculosis research. He died in Providence, R.I., May 12.

Krivitsky, Walter G. (1899–1941), former chief of the Russian army intelligence service of western Europe, was born Samuel Ginsberg, June 28, in Podvolochiska, western Ukraine. After 14 years in the soviet military intelligence service, he was called to Moscow in 1933 to head the soviet War Industries institute and in 1935 was sent abroad as chief of military intelligence in western Europe. This post he held until Nov. 1937, when he fell into disfavour with the Kremlin and fled to Paris. He later went to the United States. One of the few soviet generals to survive the Red army purge of 1936 and an outspoken critic of the Stalin regime, he lived in constant fear of the OGPU. He wrote a series of articles for the *Saturday Evening Post* in 1939 exposing soviet foreign policy. His book *In Stalin's Secret Service*, an exposé of Russia's secret policies, was published in 1939. Krivitsky died under circumstances that indicated suicide in Washington, D.C., Feb. 10.

Kuibyshev. Formerly Samara, it is a town of the U.S.S.R. in 53° 11′ N., 50° 9′ E., on the east bank of the Volga loop at the junction of the Samara river, a busy river port and important centre of rail communication. Pop. (1939) 390,000. (See *Encyclopædia Britannica*.) Renamed Kuibyshev in 1935, the town and district have been transformed from a mercantile and agricultural region into an industrial area. Industrial production in 1937 was valued at 652,000,000 roubles, compared with 363,000,000 roubles of agricultural production. Industries include railway equipment, carburettors, cinema apparatus and tractor parts, food, leather and timber. Under the expansion and mechanization of agriculture Kuibyshev, which is in the fertile black-earth district, had in 1941 approximately 150 tractor stations working on an arable area of 8,400,000 ac. More than 30,000,000 roubles were spent on irrigation during the second five-year plan, and it was decided to create in the Kuibyshev district the largest hydroelectric project in the world. Further, Kuibyshev is an important oil centre in the vast oil area which has been termed the "second Baku." As the focus of cultural activity in the Volga region, Kuibyshev supports 7 high schools, 18 higher technical schools, 6 scientific research institutes, 6 theatres and a large palace of culture.

In Oct. 1941 as the German drive upon Moscow became threatening, part of the central administration was transferred to Kuibyshev, which for a brief period was considered the provisional Russian capital, particularly since official statements to the press were issued there, and foreign correspondents were quartered in the city. During the second week in December, however, the Russians' counteroffensive on the central front removed any immediate danger to Moscow, and the administrative bureaus and newspapermen moved back to the capital. (*See* UNION OF SOVIET SOCIALIST REPUBLICS.)

Kurusu, Saburo (1886–), Japanese statesman, was born in Yokohama and studied for a diplomatic career. He entered the foreign service in 1910 and served as consul in Chicago, New York city, the Philippines and Honolulu. Kurusu was minister to Peru, 1928, director of the commerce bureau at the foreign office, 1932–37, and ambassador to Belgium, 1937. Later, as ambassador to Germany, he signed the Rome-Berlin-Tokyo pact (Sept. 27, 1940). In Nov. 1941, he was sent to the United States to assist Japanese Ambassador Nomura in what

Domei (Japanese) news agency called a "last effort to readjust Japanese-American relations which have gone from bad to worse." He started peace negotiations with President Roosevelt and Secretary of State Hull on Nov. 17, 1941. On Dec. 7, 1941, he handed Secretary of State Hull a note rejecting the U.S. peace proposals.

A few hours earlier, the Japanese had launched their blitz attack on Hawaii.

Kuwait: *see* ARABIA.

Kyanite. The production of kyanite in the United States rose from 2,950 short tons in 1939 to 4,241 tons in 1940, valued at $94,000, mainly in California and Virginia, with some from North Carolina and Georgia. Imports increased even more, from 3,381 tons to 7,658 tons, all from India. (G. A. Ro.)

Labour Party. The British Labour party's annual conference, held in June 1941, was attended by 642 delegates, of whom 354 represented trade unions, 264 divisional labour parties, and the rest Socialist and miscellaneous organizations. Less than half of the divisional parties sent delegates, for many active party workers had been absorbed into the civil defense services, besides those who were in the armed forces or busy on munitions. The same causes led to a substantial fall in local membership.

Individual membership of the constituency parties fell from 240,000 to 176,000 for men, and from 169,000 to 129,000 for women. Affiliated trade union membership, on the other hand, rose slightly—from 2,214,000 to 2,227,000—with the result that total membership showed only a small decline.

On the side of organization the most important event of the year was the decision of the Co-operative congress to join the National Council of Labour, which represents the Labour party, the Parliamentary Labour party and the Trades Union congress, and is the body responsible for general declarations of policy on behalf of the Labour movement as a whole. This meant a closer union between the co-operative and the industrial and political sections of the movement.

At the party conference, declarations dealing with the war situation and with postwar reconstruction were endorsed by large majorities. The conference reasserted its determination "to fight until naziism and fascism are overthrown," and to make "a peace which restores freedom and independence to the conquered peoples." It affirmed the need for international economic planning based on socialist principles and on recognition of "the fact that the world is now a single economic unit." It demanded a "combination of equity with efficiency" in the conduct of the war, the maintenance of civil liberty, and the extension of the social services to deal with wartime needs.

The nazi attack on the soviet union was subsequent to the party conference, and it therefore fell to the national executive and to the National Council of Labour to urge the need for closer unity between the British and soviet peoples, and for the fullest possible help to be given to the Russians.

The party appointed a special committee to study questions of postwar reconstruction, with Emanuel Shinwell, M.P., as chairman, and Prof. Harold J. Laski as secretary. It also decided to expand its research department, and to resume the publication of propagandist pamphlets on reconstruction. A number of subcommittees was appointed to deal with various aspects of postwar policy.

The electoral truce remained in force throughout 1941, and no party candidates were put forward except for seats already held by Labour. The party organized national speakers' campaigns in behalf of the war effort, and also a series of regional delegate conferences; but little general propaganda was carried on, and there was a tendency for enthusiasm to overflow into such movements as Federal Union, the 1941 Committee and Sir Richard Acland's *Unser Kampf* campaign.

A number of local parties supported the People's Convention movement, led by D. N. Pritt, K.C., which was outlawed by the national executive as acting under communist influence, and was in fact demanding peace until the nazis attacked the soviet union, when, in common with the Communist party, it rapidly changed its line.

In parliament the Labour party continued to support the government and to be represented in the war cabinet. *See* CABINET MEMBERS. (G. D. H. C.)

Labour Unions. The unusual expansion of private business and defense production during 1941 in the United States brought the unions into frequent conflict with employers, the government and one another. The favourable circumstances of rapidly increasing employment and the multiplication of government contracts for war products gave added impetus to the labour organizing campaigns which were initiated the year before. The variety of demands necessarily associated with such campaigns encountered opposition from the employers and precipitated a great increase in the number of strikes in both defense and ordinary industry. By the first of December the number of strikes amounted to more than 4,000, as against 2,400 in 1940 and 4,700 in the troubled year, 1937. Man-days lost through strikes rose to more than 22,000,000, a figure again exceeded only by 1937, when the wave of sit-down strikes and unionizing activities by the C.I.O. produced such abnormal disturbance in American industry. (*See* also STRIKES AND LOCK-OUTS.)

This condition of unrest and interruption of vital war production forced the government to make radical changes in its methods of handling labour disputes and, in some measure, in its labour policy. On March 19, the president set up by executive order a new board, the Defense Mediation board (*q.v.*), to prevent and settle strikes on defense work. This agency was a bipartisan board, composed of representatives of organized labour, employers and the government. Its first chairman, designated by the president, was Clarence A. Dykstra, president of the University of Wisconsin. The docket of the board was soon crowded with cases, certified to it by the secretary of labour. Although the board earned a fair measure of success, it was unable effectively to stem the tide of stoppages and month after month numerous defense plants were shut down, in some instances for prolonged periods. On Nov. 11, the work of the board virtually came to an end because of the resignation of the C.I.O. members and the decision by C.I.O. unions not to submit their cases to it. In December, therefore, the president convened a conference of employers and union officials instructed to devise the means of avoiding strikes and to suggest the essential features of a new arbitrating and mediating agency.

The causes of the failure of the mediation board were many but its steady loss of prestige and effectiveness and its ultimate disintegration were mainly due to the uncompromising position taken by the C.I.O. on the issue of the closed shop and the inability of the board in the first days of its operation to reach an agreement on a few guiding principles. It was clear from the outset that the most stubborn issues destined for adjudication by the board would be wages and the closed shop. Many students of labour relations believed that the board would simplify its task by seeking agreement on the basic principles of a sound public policy concerning these questions, much as the War Labor board of World War I had done. The board, however, undertook to decide each case on its merits and to refrain from laying down general principles of settlement. It was, consequently, led to arrive at contradictory conclusions, granting the closed shop in some disputes and denying it in others. This process of indecision reached

THE 700 NON-UNION EMPLOYEES of International Harvester company determined to enter their strike-closed plant at Richmond, Ind. March 27, 1941 and go back to work. A pitched battle with strikers at the gate ensued; 30 were injured

its climax in the captive mine case where the full membership of the board met to pass on the demand by the United Mine Workers for a closed shop in the coal mines owned by the steel companies and producing coal exclusively for the use of the steel industry. A majority decision against the miners was followed by the resignation of the C.I.O. members of the board and its swift demise.

Another source of weakness was the board's uncertain authority. It was not empowered to prohibit strikes, even for the duration of a waiting or cooling-off period, nor was it empowered to engage in compulsory arbitration. Yet on two occasions—in the cases of the Federal Shipbuilding company of Kearny, N.J. and Air Associates of Bendix, N.J.—when the employers refused to accept the board's findings, it recommended to the president that the government take over the plants and run them. Since the concession recommended by the board in the Kearny case was a provision for the maintenance of union membership (a requirement that employees who were members of the union at the time of the signing of the contract should retain their membership and pay dues or else be discharged) it was peculiarly unpalatable to the employers of the country and did much to undermine their confidence in the board.

In the course of the year, the closed shop became the most contentious of labour issues. The importance of this issue was closely related to the youth of leading C.I.O. unions and to the difficulties they were encountering in collecting dues from their greatly expanded membership. Recognizing the fact that many of the conditions of the current war boom were extraordinary and temporary, these unions sought to ensure themselves against future uncertainties by the use of some device that would automatically force employees into a union and keep them there once they had joined. The most effective of such devices is the closed shop, whereby employers undertake to hire and give employment exclusively to union members. Where the closed shop is in force, the union of course finds it easy to hold its members and collect dues. The drive for the closed shop aroused great opposition from the employers. They saw in it a far-reaching and serious encroachment on the powers of management and they sought to have the demand for the closed shop, except where voluntarily ceded by the employer, suspended for the duration of the war. But, although President Roosevelt announced in connection with the captive mine dispute that no government agency would force a man to join a union against his will, government agencies were reluctant to deal firmly with the question and at the close of 1941 it remained unsettled.

Pressure for higher wages was the other source of strikes and knotty labour problems. During 1941 industrial wages were raised approximately 15% and were higher than at any time in the history of the country. All unions joined in demands for greater rates of pay, but the C.I.O. usually took the initiative. Concessions won by C.I.O. unions in the coal, steel, automobile and aviation industries fixed the amount of the increase in wages that prevailed in the spring of the year at about 10 cents an hour. In the railroad industry an affirmative strike vote taken by the railroad unions was followed by the appointment of a railroad fact-finding board, as provided in the Railway Labor act of 1934. This board recommended increases averaging 12.5%. But the findings of the board were rejected by the unions, which ordered a strike of all railroad employees in December. This action brought about the resumption of negotiations, which terminated in an agreement to raise railroad wages some 15%. Rapidly rising wages and expanding employment, coupled with the considerable potential decline in the volume of goods available for civilian use, aroused general fears of inflation and some demand for a government wage policy. But the administration was unwilling to support any measures for the control of wages and, at the close of 1941, the wages question, like the closed shop, was left unsettled.

Accompanying the movement for the closed shop and higher wages was the continuance of the campaign, initiated in 1940, for greater labour participation in public defense agencies and in the management of industry. Philip Murray, president of the C.I.O., pushed on with his demand for industry councils, made up of employers, labour and public officials and charged with facilitating war production. An associate of Murray's, Walter Reuther, an officer of the United Automobile Workers, went a step further by proposing that his union be authorized to survey the automobile industry and submit a plan for converting the industry from automobile to munitions production. This proposal, generally known as the Reuther plan, was firmly opposed by employers as only another method of arriving at Murray's plan for industrial councils. All such proposals were anathema to employers since they considered them subtle attempts to weaken the authority of management. Neither the Murray nor the Reuther plan was formally adopted, but they served the purpose of enhancing the prestige of organized labour and keeping alive the issue of the proper relationship between management and unions.

Within the two federations of labour—the C.I.O. and the A.F. of L.—there were during 1941 difficult problems of internal policy. In the C.I.O. these turned on the alleged efforts of John L. Lewis to return to power in that organization. The issues of this political struggle assumed a variety of forms, but they all came to a head at the annual convention of the C.I.O. in November. On purely industrial matters, such as the strike of the captive coal mines and the support of the construction workers' union, the convention backed Lewis's policies. But he received little aid and comfort from a resolution, unanimously adopted, that strongly endorsed the foreign policy of the Roosevelt administration. Lewis's well known anti-war and noninterventionist sympathies apparently had won few adherents among the C.I.O. unions. Whether Lewis had hoped to be recalled to the presidency of the C.I.O., which he had surrendered the year before, may never be known. But the convention showed little interest in his candidacy, and the re-election of Philip Murray to that post was from the outset a foregone conclusion. Similarly the expected candidacy of Lewis's daughter for the office of secretary-treasurer failed to materialize. When the convention adjourned the anti-Lewis forces were in complete control of the C.I.O.

In the A.F. of L. the supreme political issue of the year was concerned with the relation of the parent body to its constituent unions. This was an old and knotty problem of a loose central organization like the A.F. of L. It appeared at the annual convention of the federation in connection with the trial and conviction of George Browne, president of the union of theatrical stage employees and vice-president of the A.F. of L., and his Hollywood representative, William Bioff, for taking bribes from moving picture companies. Since the federation had always been slow to discipline officers of affiliated unions, this case proved highly embarrassing. It was all the more so because Browne, as vice-president, was one of the highest officers of the federation and because the A.F. of L. had been roundly attacked in the newspapers for failing to clean out corrupt officials and reform undemocratic procedures among its constituent organizations. The convention took no general action on the question, but it solved its immediate problem by reducing the number of vice-presidents from 15 to 13, thereby vacating Browne's office.

Until the Japanese attack on Pearl Harbor, the C.I.O. and A.F. of L. carried on their competition and interunion raids. The biggest fight of the year was in the effort of both organizations to unionize the employees of the International Harvester company. The A.F. of L., over the protest of the C.I.O., succeeded in blocking the reappointment of Edwin S. Smith to the Labor Relations board. But, though it complained much, it was not clear that the C.I.O. suffered from the changes in the board's membership. The entrance of the United States into the war in December soon produced more friendly relations and an informal truce between the two federations.

In spite of strikes and political disturbances, the unions gained close to 1,000,000 members in 1941. Aggregate union membership at the end of the year was not far from 10,000,000, or twice the membership reached in the boom months of 1920. All unions shared in these gains. But the most spectacular advances were made by the C.I.O. when its unions terminated their long fights against Ford and Bethlehem Steel and won contracts with these companies. As a result of these successes, the C.I.O. had achieved virtually complete unionization of the automobile and steel industries. FENSE MEDIATION BOARD, NATIONAL; LAW; NATIONAL LABOR RELATIONS BOARD.] (L. Wo.)

Great Britain.—At the end of 1940, the 223 trade unions affiliated with the British Trades Union congress had a total membership of 5,079,000, as compared with 4,867,000 at the end of the previous year. The number of trade unionists thus continued to rise, but much less rapidly than it rose during World War I. The principal increases were in the trade unions catering to metal workers; and in this group membership rose from 861,000 to 973,000. These increases were a natural outcome of the rise in employment in the industries making munitions of war. What is surprising is that there was no corresponding increase in the general labour unions, which cater to the less skilled workers in a wide variety of occupations. In the miscellaneous transport and general labour group membership rose only from 1,150,000 to 1,166,000, increases among the less skilled munition workers being largely offset by declines in trades adversely affected by the war. Changes in other groups were relatively small; a high proportion of the workers who entered the war trades remained unorganized. There was a marked increase in the spread and activity of shop stewards' movements, especially after the German invasion of the soviet union.

The annual Trades Union congress was held in Sept. 1941, at Edinburgh. The congress was notable for the narrow defeat of two resolutions critical of the policy of the general council. The more important of these debates took place on a resolution calling for a full inquiry into the basis of trade union organization, with a view to its adaptation to meet the needs of post-war development. A special report was presented on the attempts of the general council to secure repeal or revision of the Trade Union act of 1927, which was passed following the general strike of 1926. The trade unions at first tried to get the Churchill government to agree to drastic revision of this act, which was keenly resented. This claim was met by a sharp refusal from the prime minister, on the ground that any such legislation would be highly controversial. At the congress it was decided that consultations should take place between representatives of the unions and of the Conservative party, in the hope of getting agreement to modify the sections of the act preventing the affiliation of the Civil Service unions with the Trade Unions congress, and prohibiting local authorities from making trade union membership a condition of employment. Discussions with the Conservative representatives were started, but did not, in 1941, produce any result.

All government departments connected with the war effort had some advisory machinery on which the trade union movement was represented, usually with a parallel representation of the employers.

The year was one of almost unbroken industrial peace. There were no major strikes or lockouts, and the small disputes which did occur were almost all of brief duration. The most serious trouble arose at certain ports where changes in the handling of labour designed to secure more regular work and easier transferability of dockers led to local resentment, complicated by a conflict of policy between rival unions. Apart from this, there were a number of small stoppages at aircraft and other munition factories, largely arising out of the refusal of managements to recognize trade unionism or to deal with shop stewards or similar workshop organizations, and often involving allegations by the workers that their labour was not being applied with full effectiveness. Most of these troubles were confined to single establishments, and were soon settled. In general, trade unionists, including both officials and rank and file members, actively supported schemes for the dilution of skilled labour and even during the period of communist opposition gave almost solid support to the war effort. After the nazi attack on the soviet union, the communists rapidly changed front and became the vehement advocates of higher production; but the general council of labour refused to make any change in its opposition to communists and communist-controlled bodies, and the Trades Union congress endorsed this attitude. A number of local trades councils, suspected of being under communist influence, had their recognition by the congress withdrawn, or were induced to reorganize themselves by threat of such withdrawal. But these cases were not numerous; and in general the communists were making little or no headway. When the soviet union entered the war the communists threw themselves energetically into the shop stewards' movement, to use it for speeding up war output, and under the changed conditions their local influence tended to increase. But they were not numerous; nor did they stand for any distinctive policy. (G. D. H. C.)

Labrador: *see* NEWFOUNDLAND AND LABRADOR.

Lacrosse. The year 1941 in lacrosse centres was marked by the return to top strength of the consistently great Johns Hopkins university team of Maryland. A year before, Hopkins was a notch beneath top place University of Maryland in the U.S. At the same time one of the surprises of the year was the unexpected strength of Dartmouth and Syracuse. For the first time in its history this game, which was originated by the American Indians themselves, began to gain popular favour in the middle west of the U.S. Johns Hopkins, one of the oldest lacrosse centres in the world, came through an undefeated season and crowned this achievement by defeating the Mt. Washington club, the first time the latter had been set back in two years.

As for the spread of the game in the middle west, Kenyon college, Oberlin and Michigan put teams on the field and their performances were well received by the public.

The annual north-south lacrosse game was won by the southerners with a 7 to 6 victory.

Rear Admiral Russell Willson, superintendent of the Naval academy, said that Navy would play every team on its schedule regardless of the fact that its material had been depleted by the shortening of courses because of World War II.

There was a definite trend toward women taking an active interest in lacrosse, with more girls' college and club teams participating in competition than ever before.

Women's teams from Boston, Baltimore, Philadelphia, Westchester and New York participated in the national women's lacrosse tourney at Adelphi college, Garden City, L.I. over the Memorial Day weekend. (T. J. D.)

Laffoon, Ruby (1869–1941), U.S. politician and governor of Kentucky from 1931 to 1935, was born Jan. 15 at Madisonville, Ky. During his term as governor, Laffoon created 2,368 Kentucky "colonels," among whom were Mae West, Jean Harlow, Mary Pickford, Charles Chaplin, Jack Dempsey and Clark Gable. Faced with a serious strike among miners in 1932, Laffoon was forced to call out the militia on several occasions to keep order. He died in Madisonville, Ky., March 1.

La Guardia, Fiorello Henry (1882–), U.S. politician, was born in New York city, Dec. 11. He went to high school in Prescott, Ariz. From 1901 to 1906 he served in U.S. consulates in Hungary and Austria. He graduated from New York university law school in 1910. He was congressman from New York, 1917–21 and 1923–33. He commanded the U.S. flying force on the Italian front during World War I. In 1919 he was president of the New York city board of aldermen. In 1929 he was defeated for mayor of New York city, but was elected in 1933 after a three-cornered fight; he was re-elected in 1937 and again in Nov. 1941. In Aug. 1940, Pres. Roosevelt appointed him chairman of the U.S. section of the Canada-United States permanent joint board of defense, and in May 1941 the president named him director of the Office of Civilian Defense (*q.v.*). La Guardia resigned the directorship on Feb. 10, 1942.

Lamberton, Robert Eneas (1886–1941), mayor of Philadelphia, was born Sept. 14 near South Bethlehem, Pa. After receiving his law degree from the University of Pennsylvania, he began practice in Philadelphia in 1911. He was a member of the common council, 1916–20, and was sheriff of Philadelphia county, 1920–24. He served as a judge in the common pleas court from 1931 to 1939 but left the bench before his full term expired to run for mayor in Nov. 1939. After his victory at the polls, Mayor Lamberton instituted the wage and income tax designed to ease the city's debt burden. He died at his summer home in Longport, N.J., Aug. 22.

Land Banks: *see* FEDERAL LAND BANKS.

Langmuir, Arthur Comings (1872–1941), U.S. research chemist and authority on glycerine and shellac, was born Feb. 7 in Evanston, Ill. He studied at the school of mines, Columbia university, and at Heidelberg university, where he received his Ph.D. degree in 1895. He then became assistant to Prof. C. F. Chandler of Columbia university, 1895–96. From 1898 to 1900 he was instructor at Pratt institute and for the next 20 years he was chief chemist for a Brooklyn (N.Y.) glycerine and shellac firm. Dr. Langmuir formulated methods for analysis of shellac and glycerine which won him world recognition. In 1910 he was chairman of the American Chemical society commission, London, and was a member of various scientific societies in the United States and Great Britain.

He established the American Chemical Society prize, a $1,000 award given annually to young research chemists working in U.S. universities. His brother, Irving Langmuir, won the Nobel prize in chemistry in 1932. Dr. Langmuir died May 14, at his home in Hastings-on-Hudson, N.Y.

Lanman, Charles Rockwell (1850–1941), U.S. Sanskrit scholar, was born July 8, in Norwich, Conn. He was a professor of Sanskrit at Harvard from 1880 until his retirement in 1926, when he became professor emeritus. In academic circles he was widely known as a leading authority of oriental literature and culture and was actively connected with many learned societies. He was a lineal descendant of Francis Cook and John Alden. Dr. Lanman died in Boston, Mass., Feb. 20. (See *Encyclopædia Britannica.*)

Laos: *see* FRENCH COLONIAL EMPIRE.

Lapointe, Ernest (1876–1941), Canadian statesman, was born Oct. 6 in St. Eloi, Quebec. He was a member of parliament, 1904–1941, and minister of justice, 1924–30 and 1935–41. Lapointe was also a member of the Canadian delegation to the imperial conference in London, 1937, and was made a member of the privy council of the United Kingdom in the same year in recognition of his services to the empire. A close friend of Prime Minister Mackenzie King, Lapointe supported Canada's entry into war in 1939, but he opposed conscription as he had in 1914. He died in Montreal, Nov. 26. (See *Encyclopædia Britannica.*)

Lasker, Emanuel (1868–1941), German chess player, born Dec. 24 at Berlinchen, Germany, was the world's chess champion from 1894 to 1921. He studied mathematics at the universities of Berlin and Goettingen, and received the degree of doctor of mathematics at Heidelberg in 1897. He learned to play chess at the age of 12 and made a serious study of the game under the guidance of his older brother, Berthold. Barely 21, he attracted the attention of the chess world by defeating Feyerfeil at Breslau and earned the title of German master of chess. A series of successes followed and in 1894 he challenged Wilhelm Steinitz, holder of the world's championship for 28 years. Lasker won a decisive victory and in a return match two years later he won even more conclusively. Lasker finally ceded his crown to a young Cuban, José R. Capablanca, in 1921. Critics praised the master's calm and objective judgment and his extraordinary self-possession under the severe strain of a game. He founded a chess magazine in 1904, and wrote numerous manuals and essays on chess, mathematics, history and philosophy. He died Jan. 11 in New York city.

Latvia. One of the Baltic states of northeastern Europe, north of Lithuania, south of Estonia, formerly a republic; in 1941 it became part of the German "Ostland." Area, 25,016 sq.mi.; pop. (est. Jan. 1, 1939), 1,994,500. Capital, Riga (385,063 in 1935); the other principal city was Liepaja (57,098). Language, Latvian. Religion, Christian (Protestant, 56%; Roman Catholic, 24·5%; Greek Catholic, 9%; Greek Orthodox, 5·5%). The country was ruled, after the German occupation in 1941, through Reichscommissar Heinrich Lohse.

History.—Like its neighbours Estonia and Lithuania (*qq.v.*), Latvia was buffeted in 1941 by the strife between the U.S.S.R. and Germany. From June 1940 to June 1941 Soviet Russia controlled the country and started its program of collectivization. Even before the Russians occupied the country, forestalling the Germans, most of the Germanic "Balts" had been repatriated in Germany or Poland. The period of soviet occupation, coinciding with straitened circumstances everywhere, sufficiently embittered the people so that some at least welcomed the nazi invasion in June 1941, and thought that Latvia might attain autonomy. Evidently less damage was done in the occupation of Latvia than in either of the neighbouring states.

However, the Germans soon began to treat Latvia as a conquered province. Branches of German banks such as the Commerz bank, the Dresdner bank and the Bank der Deutschen Arbeit were established in Riga, and heavy demands for export of agricultural produce to Germany were reported. Horses were taken from Riga cab drivers and sent to do farm work, while people from 16 to 60 were required to register with the German labour office. What measures were permanent and what were merely for wartime emergency was not evident, but toward the end of 1941 all the Baltic countries were being organized into the "new order."

Statistics of education, finance and economic conditions ceased to be issued in Latvia after the soviet occupation in 1940; the latest available figures at the end of 1941 applied for the most part to 1938 and 1939.

Education.—In 1938–39 there were 1,895 elementary schools with 229,825 pupils and 114 secondary schools with 25,225 pupils. Enrolment at the University of Riga was 7,281.

Finance.—The monetary unit is the lat (=19.3 U.S. cents at par, established as equivalent to the Swiss franc in 1921). Effects of German control were still uncertain at the end of 1941. In 1939 the budget estimates envisaged revenue of 190,878,000 lats and expenditures of 190,481,000 lats.

Trade and Communication.—Imports in 1938 were 227,336,000 lats; exports 227,204,000 lats. Chief articles of import were industrial machinery, agricultural machinery, automobiles and accessories, coal, cotton textiles, cotton (raw) and wheat. Chief articles of export were timber, flax, plywood and butter. Exports went chiefly to Great Britain, Germany, the U.S.S.R. and the Netherlands. Imports were primarily from Germany, Great Britain, the U.S.S.R., Sweden and the United States. In 1940 the Latvian state railways operated over 2,200 mi.; bus lines over 2,800 mi. The principal harbours are Riga, Liepaja and Ventspils.

Agriculture.—The principal crops with their yields (in short tons) were as follows in 1939: rye, 493,830; barley, 245,041; oats, 534,395; wheat, 233,247; potatoes, 1,807,882; flax, 54,123. Livestock included 414,470 horses, 1,271,730 cattle, 1,469,570 sheep, 891,470 pigs, 4,729,120 poultry, 222,460 beehives.

Manufacturing.—After the decline in 1931 and 1932, Latvia's industrial production rose rapidly to a general index figure of 148 in 1937 (based on 100 in 1930). Strong efforts were made up to 1939 to increase the self-sufficiency of the country.

At the beginning of 1939 some 5,970 industrial establishments employed 98,500 persons, and in 1938 produced a value of 695,000,000 lats. Chief industries were foodstuffs, wood and paper and textiles. (F. D. S.)

Laughlin, Clara Elizabeth (1873–1941), U.S. travel writer, was born Aug. 3 in New York city. After graduating from high school in Chicago in 1890, Miss Laughlin edited a religious weekly. From a skimpy budget of $20 weekly for original material she managed to save $25 and sent it to James Whitcomb Riley for "$25 worth of poetry." Riley responded with a poem a "half a yard long," and the two struck up a fast friendship. In the early 1900s, she wrote a number of novels, the most famous of which is *Felicity* (1907). She wrote *Foch, the Man* (1918) and *The Martyred Towns of France* (1919). She had travelled extensively in Europe before World War I, but it was not until 1924 that she launched into her career as travel writer. In that year her first travel book, *So You're Going to Paris*, met with such success that she wrote a series of travel works, all starting with the title "So You're Going to. . . ." She also founded and directed a travel service. Miss Laughlin died in Chicago, March 3.

Laughlin, Irwin Boyle (1871–1941), U.S. diplomat and steel executive, was born April 26

in Pittsburgh, Pa. Laughlin renounced an executive position in the Jones & Laughlin Steel company, which was founded by his grandfather, to become private secretary to the U.S. minister in Japan, a post he held from 1903 to 1905. In 1906 he was named second secretary in the American legation in Tokyo. After serving in various U.S. consulates and embassies in the far east and Europe, he was appointed minister to Greece, 1924–26. Laughlin was ambassador to Spain from 1929 to 1933. He died in Washington, D.C., April 18.

Lauri, Lorenzo (1864–1941), Italian cardinal and chamberlain of the Roman Catholic church, was born Oct. 15 in Rome. During his tenure as papal nuncio to Poland, he was instrumental in negotiating the concordat in 1925 between the Vatican and the Warsaw government. Mgr. Lauri, who also served as nuncio in Chile, Peru and Spain, was made a cardinal in 1926 and was grand penitentiary, prior to his promotion in 1939 to the office of chamberlain, highest administrative post under the pope. Cardinal Lauri administered the treasury as well as the properties and temporal rights of the Holy See. He died Oct. 8 at Rome.

Laval, Pierre (1883–), French statesman, was born June 28 at Châteldon, Puy-de-Dôme. For a brief biographical sketch, see *Encyclopædia Britannica*. Laval had remained in comparative obscurity after the start of war in 1939 until he was delegated by Marshal Pétain to draft a new constitution July 5, 1940, after the downfall of France. A week later Pétain named him his successor as well as vice-premier. During the succeeding weeks Laval, who had obvious pro-nazi inclinations, made several visits to Paris and occupied France to consult with Hitler (Oct. 22, 1940, near Compiègne), Goering and other high German leaders. As early as September a rift was reported between Pétain and Laval, and on Dec. 13 the latter was abruptly dropped from the Vichy cabinet and temporarily interned. The Germans, through High Commissioner Otto Abetz, then apparently intervened on behalf of Laval and secured his release, though Pétain did not restore him to his former high offices.

The marshal offered to reinstate Laval early in 1941 as a minister of state, but Laval declined. During the rest of the year he did not figure very prominently in the affairs of Vichy France. On Aug. 27 a young Frenchman, Paul Colette, shot Laval and Marcel Déat and wounded both during a parade of the French Legion of Volunteers to Combat Bolshevism, in Versailles. Laval recovered and was able to leave the hospital Sept. 11. In October, Pétain commuted Colette's death sentence to life imprisonment.

Lavery, Sir John (1856–1941), British painter, was born in March in Belfast, Ireland. He was elected president of the Royal Society of Portrait Painters in 1932 and was a member of the academies of Antwerp, Milan, Rome, Brussels and Stockholm, the Société Nationale des Beaux-Arts of Paris, the Society of Spanish Artists in Madrid and the Secessions (art groups formed in the late 19th century to protest against academic qualities in art) of Berlin, Vienna and Munich. In Nov. 1918 he was invited by the admiralty to visit the grand fleet and sketch the surrender of the German navy at Scapa Flow. George Bernard Shaw and Steve Donoghue, famous English jockey, were among those who sat for Sir John, and his canvas of Cardinal Hayes of New York is at Fordham university, New York city. His portrait of an "Irish colleen," the model for which was his American wife, appears on the paper currency of Eire. He was the author of one book, *Life of a Painter* (1940). Sir John died Jan. 10 in Kilmoganny, County Kilkenny, Eire. See his biography in *Encyclopædia Britannica.*

Law. The year 1941 saw the transition from a defense to an all-out war economy with all its far-reaching implications. While domestic controls were tightened, particular attention was concentrated upon four main phases: (1) Production, which, through priorities, allocations and requisitions converted the market from a buyers' to a sellers' market; (2) price control, which, through a determination of price ceilings was desperately attempting to stave off the inflationary spiral toward which U.S. economy appeared to be headed; (3) labour, whose jurisdictional feuds and inability to agree with management brought on the creation of an all-powerful War Labor board; (4) taxation, to provide for the billions which must be expended in the total war effort.

The many fields of the law, however, were not neglected by judicial decisions or administrative orders. These, selected because of their relative importance or their significance as trends, are briefly reviewed under the following titles:

ADMINISTRATIVE LAW
AGRICULTURE
Legislation
ARBITRATION
BANKING
BANKRUPTCY
CIVIL RIGHTS
CONSTITUTIONAL LAW
CONTRACTS
COPYRIGHT
CORPORATIONS
DOMESTIC RELATIONS
INSURANCE
LABOUR
Widened Federal Control
Immunity from Anti-trust Laws
Broadening of Labour Board's Power
War Labor Board
Rights of Labour

Trade Regulation
Freedom of Speech
Conscription
Civil Relief to Soldiers and Sailors
Commandeering
ALIENS
PATENTS
PUBLIC UTILITIES
SECURITIES
SOCIAL SECURITY
TAXATION
TORTS
TRADE REGULATION
Jurisdiction of the FTC

While national defense dominated the scene, as industry passed from civilian needs to military requirements, the many administrative boards normally concerned with peacetime endeavours doubled their efforts to justify their existence. The federal trade commission and the department of justice struck out after profiteering as well as fifth-column activity under the guise of dummy corporations, patent pools and other subterfuges to conceal ownership of American industries by enemy aliens. The labour board emphasized collective bargaining through appropriate units as essential to expeditious production on the assembly line. The Federal Communications commission, like the Securities and Exchange commission, began the decentralization of major monopolies: the FCC—divorcement of the major networks; the SEC—the liquidation of the gigantic holding companies. These and many other boards were vastly re-enforced by rulings of the United States supreme court (*q.v.*) reasserting their supremacy as fact-finding bodies in their respective domains. This review of the year begins, accordingly, with a brief consideration of the major principles announced by courts on the fundamental doctrines which govern these administrative tribunals.

Administrative Law.—Most administrative rulings are considered under their special category in this article, *i.e.*, labour, trade, securities, etc. Here are reviewed briefly only such general principles as permeate the entire field of administrative law, *i.e.*, the power of administrative boards—fact finding and rule making, and the conclusiveness of their holdings where not arbitrary and unreasonable.

Laws enforceable by administrative boards had latterly seldom been challenged. Any effort to contest them had been via constitutional rights, *i.e.*, undue delegation of authority to an administrative board; or assuming the authority was properly delegated, no fair hearing was granted by the board; or granted a fair hearing, the board overstepped its bounds in the particular order it issued. In *Lowell Sun Co.* v. *Fleming* (120 F. [2d] 213) invalidating a subpoena by a regional director ordering the production of works and records, the court held that the administrator alone may issue subpoenas, and he may not delegate this power since there is no express statutory authorization to do so. In the course of these cases the courts made it clear that one official might not examine the evidence and pass it on to another, who had not considered the evidence, to make find-

ings and issue an order. Any review of such a ruling, however, must be restricted to the record and the administrative officer (secretary of agriculture) should not be called to testify as to the mental processes by which he reached his conclusion. So long as opportunity to present evidence on defined issues was given, the appraisal of the uncertain factors involved was for the secretary and not the courts; and there was no disqualification for bias (*United States* v. *Morgan*, 313 U.S. 409, 61 Sup. Ct. 999, 85 L. ed. 928).

In *National Labor Relations Board* v. *Prettyman* (117 F. [2d] 786) the court held that by removal of proceedings from Ann Arbor, Mich. to Washington, D.C. without just cause, the labour board had denied the respondent due process of law in the proceedings upon which its order was based.

In *National Labor Relations Board* v. *Express Publishing Co.* (312 U.S. 426) the supreme court reviewed the permissible scope of a cease and desist order. In that case, in addition to an affirmative order to bargain, the NLRB ordered the respondent to cease and desist: (1) from refusing to bargain collectively with the authorized representative of its employees, and (2) from in any manner interfering with, restraining or coercing its employees in the exercise of their rights to self-organization, collective bargaining and other rights, all guaranteed by section 7 of the act. The circuit court decreed enforcement of the affirmative order only. On appeal, the principal question was whether the board's finding only of refusal to bargain and of the making of certain statements interfering with efforts to negotiate justified issuance of the broad cease and desist order (2) above. The supreme court held the board does not have authority under the Wagner act (sec. 10[c]) to enjoin all violations of rights guaranteed in section 7 of that act, merely because the unfair practice found under section 8(5) (refusal to bargain) is also a violation of section 8(1) (making an infringement of section 7 an unfair practice). Mr. Justice Douglas, joined by Justices Black and Reed, dissented.

Agriculture.—Milk regulations continued an important aspect of agricultural control. In *Stracquadanio* v. *Department of Health* (285 N.Y. 93), the New York court of appeals held that a health regulation limiting permits to milk distributors in business before June 1, 1939, does not violate the constitution. After an extensive survey had demonstrated that unsanitary practices were common among milk distributors who lacked their own pasteurizing facilities, the New York city board of health in 1939 amended its regulations to require permits from such distributors, but provided that a permit should not be granted unless the distributor was in business before June 1, 1939. The board refused a permit to the petitioner, who had not been in business on that date. Contending that he was denied equal protection of the laws, the petitioner sought a mandatory order that the board issue him a permit. On appeal from a denial of the petitioner's application, the court held that the regulation was constitutional as a reasonable attempt to prevent the increased difficulty of enforcement which might result from unlimited competition.

Held constitutional was a Minnesota statute requiring wholesale dealers in farm products to be licensed, to post a bond to insure payment to vendor farmers and to make reports to such farmers concerning the sale of produce (*Minnesota* v. *Marcus*, July 3). State and local taxes may not be assessed against land purchased by borrowers with proceeds of loans under the Bankhead-Jones Farm Tenant act after such land has subsequently been acquired by the United States through purchase at foreclosure sale or through acceptance of a deed in lieu of foreclosure. Liquor distillers were held not entitled to a return out of the United States treasury of money paid by them under marketing agreements which were made pursuant to the Agricultural Adjustment act, since the money which was to be utilized under terms of agreement for rental or benefit payments to farmers was not so used (*Stitzel-Weller Distillery* v. *Wickard*, 118 F. [2d] 19).

New regulations and rules governing procedure under the Perishable Commodities act and Produce Agency act were issued (including disciplinary proceedings) on June 17. The pattern embraced a fourfold classification: (1) rule-making proceedings; (2) reparations proceedings; (3) disciplinary proceedings; and (4) rate-making proceedings. A more detailed codification was provided on June 27, covering all procedural steps necessary in the administration of the Packers and Stockyards act, as well as procedure in disciplinary proceedings.

Legislation.—Agriculture Appropriation act, approved July 1, provided appropriations for the secretary and department of agriculture: (a) to make parity payments to producers of wheat, cotton, corn, rice and tobacco in accordance with section 303 of the AAA act of 1938; (b) to make payments to states, Hawaii, Alaska and Puerto Rico for agricultural experiment stations; (c) for disposal of surplus commodities; (d) to carry out the Sugar act of 1937; (e) to carry out the Farm Tenant act; (f) for loans, grants and rural rehabilitation; (g) for the Rural Electrification administration, the Farm Credit administration and other bureaus and services of the department.

Commodity Credit act (Steagall) approved July 1: (1) extended for two years the life of the Commodity Credit corporation, to June 30, 1943; (2) provided increase in amount of permissible outstanding obligations from $1,400,000,000 to $2,650,000,000; (3) directed the secretary of agriculture during emergency to encourage production of such agricultural commodities as he deemed necessary to the defense program, by making commodity loans through the Commodity Credit corporation. He was required to support the prices of such commodities to prevent their falling below 85% of parity.

Corn and Wheat Marketing Quota act approved May 26: (1) established as farm marketing quotas for wheat and corn the actual production of the acreage planted, less the normal or actual production (whichever is smaller) of the acreage in excess of the allotment granted; (2) directed the secretary to impose regulations as to excess production above prescribed marketing quotas, either for the farmer to store the excess or to deliver the excess to the secretary, or to pay a penalty based on the excess—the government retaining a lien on the whole crop until the penalty is paid, or crop is stored or delivered.

Marketing Quotas act, approved Dec. 26, amended the Agricultural Adjustment act of 1938 to be retroactive effective to May 26, by a new paragraph intended to modify the farm-marketing quota for wheat for 1941 and subsequent crop years to provide relief in the case of farms harvesting less than a normal crop.

Parity act, approved Dec. 26, extended to Jan. 1, 1947, the period within which the secretary of agriculture might carry out the purposes of the Soil Conservation and Domestic Allotment act by making payments and grants of aid to agricultural producers, prolonging until that date the life of the AAA soil conservation program and the 35% parity crop loans on cotton, corn, wheat, rice, tobacco and edible peanuts.

Sugar Quota act, approved Dec. 26, extended for an additional three years, until Dec. 31, 1944, the quota system set up by the Sugar act of 1937. (*See* also AGRICULTURE.)

Arbitration.—Arbitration played a significant role in commercial and industrial disputes, although as to disputes arising out of defense contracts the government denied the benefits of arbitration with respect to its own contracts.

The National Defense Mediation board (*q.v.*) was created on March 19, comprising representatives of the public, employees and employers. In the major tie-ups on defense production, however, the board was not successful in settling the labour disputes brought before it; hence the creation of the War Labor board in 1942 with power to compel arbitration and render final determinations in all disputes for the duration of the war.

Commercial arbitration saw its most signal achievement in the form of a consent decree against the big five motion-picture producers. The development of this technique, styled legislation by negotiation, and the primary enforcement of the decree procured by the assistant attorney general for the alleged violations of the antitrust laws were delegated to the American Arbitration association. By virtue of the decree only the defendants who had consented to the arbitration procedure were obligated to arbitrate all claims brought against them. The right to initiate arbitration proceedings was unilateral and could be invoked only by aggrieved exhibitors. However, no such exhibitor was compelled to arbitrate any dispute which he elected to try directly in a legal proceeding under the antitrust laws. If the exhibitor decided to arbitrate, however, he would be allowed to do so only if he agreed in advance to accept the award of the tribunal.

Banking.—The Federal Deposit Insurance corporation was held entitled, under the Missouri statutes, to an allowance for interest on a claim for an amount paid depositors of a closed state bank after approval of such claim by receiver, although no demand for interest was made at the time of filing and approval (*Federal Deposit Insurance Corp.* v. *Citizens State Bank of Niangua*).

Withdrawals made by a depositor after the termination of the bank's insured status under provisions of the Federal Deposit Insurance law, continuing in force for two years insurance on amount on deposit at the time of termination, are not chargeable against the amount of the insured deposit as long as such withdrawals do not exceed the amount on hand from new deposits (*Federal Deposit Insurance Corp.* v. *Winton*).

The consent of the state commissioner of banking required of state banks by statute as a condition to establishing branch banks need not be obtained by a national bank to entitle it to establish branch banks (*State Banking Commission* v. *Michigan National Bank*).

Bankruptcy.—The United States supreme court handed down a number of important decisions and made some significant interpretations of various provisions of the Bankruptcy act including provisions of the recently enacted Chandler act (Corporate Reorganization). In *Consolidated Rock Products Co* v. *Du Bois; Badgley* v. *Du Bois* (312 U.S. 510) the court considered the fairness of a plan for reorganization of a holding company and two subsidiaries. The plan of corporate reorganization eliminated the accrued interest claims of the bondholders of the subsidiary companies and provided for the issuance of bonds and stock in the new corporation in the face amount of the old bonds. Stockholders of the holding company were to receive stock in the new corporation for their old stock. In confirming the plan the trial court made no findings as to the specific value of the separate properties, or of the properties of the enterprise as a unit, nor did it take into account the amount or validity of a claim by the subsidiaries against the parent corporation under an operating agreement. In the absence of such valuation data, the supreme court held that no determination of the fairness of the plan could be made. The court held, though, that participation by the equity interests in any of the assets was precluded by the full and absolute priority rule "until the bondholders had been made whole," and that the relative priorities granted by the plan to creditors and stockholders did not satisfy that principle.

Back pay is a debt which may be proved in bankruptcy. In *NLRB* v. *Killoren*, trustee of Hamilton-Brown Shoe Co. (122 F. [2] 609) the NLRB ordered the shoe company to reinstate certain employees with back pay. Before the circuit court affirmed this order, the company filed a petition in bankruptcy and thereafter was adjudicated a bankrupt. The NLRB filed claim for the back pay award, which the referee and district court denied. The circuit court held that a back pay award is a provable debt entitled to priority as wages and may be properly filed by the NLRB in bankruptcy proceedings.

Civil Rights.—The supreme court of the United States on April 14 overruled the celebrated decision of that court handed down in 1918 wherein it held the Toledo Newspaper company, publisher of the *Toledo News Bee*, and its editor guilty of contempt because of the reasonable tendency of the contemptuous writing to obstruct justice. By statute, federal courts had power to punish contempts provided the contempt had been committed so near to the court as to obstruct the administration of justice. In *Nye* v. *U.S.* (313 U.S. 33) the district and circuit courts held defendants guilty of contempt when they induced a feeble-minded and illiterate plaintiff to drop his action. In reversing the conviction the supreme court held that the contempt, to be punishable, must be in geographical proximity to the court; mere relevancy to the work of the court is insufficient to sustain an action for contempt.

In another case (*Times-Mirror Co.* v. *Superior Court of California*, 62 Sup. Ct. 190) against the *Los Angeles Times* and its managing editor, the Los Angeles bar association initiated the proceedings on the theory that newspaper comment on litigation before it is finally determined, whatever the date of determination may be, has a tendency to obstruct justice. The *Times* defended itself in the lower courts and before the supreme court of the United States on the ground that the editorials presented no clear and

present danger to the administration of justice and that the reasonable-tendency test laid down in the Toledo newspaper case was not the proper test.

In a five-to-four decision the supreme court held that neither Harry Bridges, west coast labour leader, nor the *Los Angeles Times* may constitutionally be held in contempt of court, for their conduct, respectively, in (1) sending a telegram to the secretary of labour denouncing a court decision against Bridges; and (2) publishing editorials approving verdicts of guilty in still-pending prosecutions of sit-down strikes and of one active in local politics for grand larceny (*Bridges* v. *State of California*, 62 Sup. Ct. 190). (*See* also CIVIL LIBERTY.)

Constitutional Law.—Of outstanding concern in the realm of constitutional law was the issue of states' rights. A state statute regulating interstate transportation agents was held not to violate the commerce clause of the federal constitution. In *California* v. *Thompson* (313 U.S. 109) a California statute, violation of which constitutes a misdemeanour, required every transportation agent (defined as one who "sells or offers to sell or negotiate for" transportation over the public highways of the state) to procure a licence from the state railroad commission. The respondent was convicted under the statute for arranging, without a licence, the interstate motor vehicle transportation of passengers by one who made the single trip in question. In sustaining the conviction, the supreme court held that the statute is a valid exercise of the state police power, and an equally valid regulation of interstate commerce, in that it does not unnecessarily obstruct interstate commerce.

On the other hand a state regulation which is an unreasonable obstruction to the mobility of interstate commerce is a violation of the limitations imposed on the state's power by the commerce clause of the U.S. constitution. Such was a statute requiring filing of a surety bond before sale of out-of-state used cars (*State v. Ernst*, 297 N.W. 24 [Minn.]).

In *Hines* v. *Davidowitz* (312 U.S. 52) the supreme court considered the concurrent power of a state legislature. Pennsylvania passed a statute providing for the registration of aliens (*Pa. Laws*, 1939, no. 304, p. 652). The federal district court enjoined enforcement of the act on the grounds that it denied aliens equal protection of the laws, and that it encroached upon powers vested in the federal government. In 1940, after the district court had enjoined enforcement of the state act, congress passed the federal Alien Registration act. On appeal the supreme court affirmed the judgment of the district court (three justices dissenting). The Pennsylvania act cannot be enforced because congress by adopting a comprehensive, integrated scheme for registration of aliens, including its 1940 registration act, has precluded state action such as that in this case.

A state has the power to enjoin unfair labour practices of employees in industries engaged in interstate commerce. In *Allen-Bradley Local No. 1111, United Electrical, Radio and Machine Workers of America* v. *Wisconsin Employment Relations Board* (295 N.W. 791 [Wis.]) the defendant union and certain of its members were found guilty of unfair labour practices as defined by the Wisconsin Employment Relations act. The labour board issued a cease and desist order, which was sustained by the lower court, despite the defendant's contention that the statute was unconstitutional on the ground that congress had precluded such state legislation affecting interstate industries by enacting the National Labor Relations act. The court, holding for the plaintiff, ruled that state legislation not repugnant to the Wagner act is operative in this field so long as the National Labor Relations board has not acted in the particular matter.

Contracts.—Since the government had become the largest customer in the world, the supreme court's interpretations of public contracts was of particular importance. In *U.S.* v. *Cowden Mfg. Co.* (312 U.S. 34) a clause in the public contracts provided for reimbursement of any taxes "made applicable directly upon the production, manufacture or sale of the supplies covered by this contract." A contractor sought to recover taxes imposed under the Agricultural Adjustment act on the contractor's subcontractors, but borne by the contractor. In denying him recovery the supreme court concluded that the federal taxes clause did not obligate the United States to reimburse the contractor, who was to supply a certain kind of mechanic's suit, for the processing taxes imposed on sellers to the contractor and borne by the contractor under an agreement with the subcontractor.

The Miller act gives materialmen and labourers a right of action upon the payment bond if they had a direct relationship with a subcontractor but not with the contractor furnishing the bond, upon the giving of written notice to the contractor within 90 days from the date on which the person did or performed the last of the labour or furnished or supplied the last of the material for which the claim is made. The statute prescribes that such notice shall be served by mailing the same by registered mail to the contractor, "or in any manner" in which the United States marshal of the district in which the public employment is situated is authorized by law to serve summons. The materialman sent the notice by ordinary mail to the government project engineer, who admitted actual receipt. The supreme court holding that this mailing complied with the notice and provision of the act ruled that the statute be given a reasonable construction in order to achieve its remedial purpose (*Fleischer Engineering & Construction Co.* v. *Hallenbeck*, 311 U.S. 15).

In the general realm of contracts, the New York supreme court decided that an agent who contracts for bribes with a party adverse to his principal is accountable for any commissions received. He is also ordinarily barred from enforcing the illegal contract against the third party. In *Rush* v. *Curtiss-Wright Export Co.* (175 Misc. 873, 25 N.Y.S. [2d] 597) the government of Colombia offered X a position as purchasing agent, inspector and aviation defense adviser. He accepted after the defendant aviation company promised him commissions and bonuses on all sales made to Colombia. The court found that X did not inform Colombia of this agreement. X's assignee brought suit for the commissions due; Colombia did not enter the action. The court held that the plaintiff could recover although the contract was illegal, but only as constructive trustee for Colombia.

Copyright.—A unanimous decree of the U.S. circuit court of appeals at Los Angeles upheld a decision of the district court that recordings can be made of any literary works and sold for commercial purposes without royalty payment as long as such works are not dramatized. In *Corcoran* v. *Montgomery Ward & Co.* (121 F. [2d] 572) the plaintiff charged defendant with recording and selling his original copyrighted poem, "Plain Bull," thereby committing an infringement of copyright. The court, although conceding the justice of plaintiff's claim, pointed out that in the 1909 revision of the Copyright act, composers were given the exclusive right of recording their musical compositions and the same right was granted to authors of copyrighted dramatic works. However, congress did not give like protection to copyrighted poems, stories and similar literary material.

Corporations.—The court refused to impede the industry-wide regulation of coal producers by exempting wholly-owned subsidiaries of the great industrial consumers seeking to assure their fuel supply. In *Keystone Mining Co.* v. *Gray* (120 F. [2d] 1) the Delaware, Lackawanna and Western railroad took the entire output, with unimportant exceptions, of the Keystone Mining company, a wholly-owned subsidiary. Keystone and Lackawanna had a common treasurer, two common directors and some common employees. While Keystone's books were kept separately, they were maintained in Lackawanna's offices. General policy was determined in consultation with the president of Lackawanna, but Keystone did its own purchasing and hiring and firing, paid its own taxes and made its own decisions. The National Bituminous Coal act states that its provisions "shall not apply to coal consumed by the producer, or to coal transported by the producer to himself for consumption by him." Keystone appealed from the denial of its petition for exemption. In affirming the order, the court held that Keystone cannot be considered the agent or the instrumentality of Lackawanna so as to exempt it as a consuming producer.

In *Matter of the Grand Jurors Ass'n, Bronx Co., N.Y., Inc.* (25 N.Y.S. [2d] 154) after several grand jury associations had been incorporated in New York and New Jersey, the Bronx County Grand Jurors association presented a certificate of incorporation to the supreme court for approval under sec. 10 of the New York Membership Corporation law. The association, consisting of past and present grand jurors, desired incorporation in order to promote the efficiency of the grand jury system and to advocate desirable changes in the criminal law. The court denied the certificate because the corporation might tend to influence the attitude of its members serving on grand juries, and because the name might cause confusion with the official grand jurors.

Domestic Relations.—The law of most states, Minnesota included, prevents a wife from bringing a civil suit against her husband for personal injury. In *Kyle* v. *Kyle* (297 N.W. 744 [Minn.]) the wife of the defendant alleged that while riding as a passenger in defendant's car over a Wisconsin highway she was injured in an accident occasioned by the defendant's negligence. Such an action may be maintained under the law of Wisconsin (place of the injury). In sustaining the defendant's objection to the complaint, the court held that since the well established law of the forum (place of trial) prevents a wife from bringing a civil suit against her husband for personal injury, it would be contrary to strong public policy to invoke the rule of comity and allow the enforcement of the action in Minnesota. Although full faith and credit does not require such holding, a foreign decree for future alimony may be established as the decree of the forum, subject to being altered if and to the extent that the foreign court later modified its original decree. In *Biewend* v. *Biewend* (109 P. [2d] 701 [Calif.]) the plaintiff received a valid divorce decree in Missouri whereby the defendant was ordered to pay weekly alimony. The plaintiff remarried, was divorced a second time, and then lived with defendant again for four years. Both parties having become domiciled in California, plaintiff brought an action to enforce the foreign alimony decree. Although California law denied the divorced wife the right to continued payments of alimony in case of her remarriage, the plaintiff was granted a judgment which was affirmed on appeal for the amount of the accrued unpaid alimony, and the defendant was ordered to continue his payments under the Missouri decree from the time of the California judgment.

In *Vernon* v. *Vernon* (262 A.D. 431, 29 N.Y.S. [2d] 736) the defendant wife, while domiciled in Nevada, procured an ex parte (uncontested) divorce. The plaintiff appeared after judgment and secured a modification of the decree with respect to the provisions for alimony and custody of their child. Upon the remarriage of the wife, the plaintiff, claiming that the Nevada decree should not be recognized, brought an action in New York for divorce on the grounds of adultery. Judgment for plaintiff was reversed on appeal. Although the original Nevada decree was invalid in New York, the modified decree entered subsequent to the appearance was binding on the plaintiff and entitled to recognition.

Legislation to require persons, seeking a marriage licence in Massachusetts to undergo a physical examination and blood test for syphilis was enacted by Massachusetts on July 29. An amendment to exempt persons whose religious beliefs opposed a blood test was rejected by a vote of 12 to 8.

Insurance.—The question of what law would determine rights under an insurance policy was considered by the U.S. supreme court in *Stoner* v. *N.Y. Life Ins. Co.* (311 U.S. 464). The insured was a citizen of Texas and the policy had originally been issued in New York. The principal beneficiary of the policy was originally a syndicate of business associates of the insured. Subsequently, upon termination of the business enterprises of the association, a new syndicate was formed with the sole objective of paying premiums on the policy which was changed to make the members beneficiaries, as a protection to them for money advanced to the insured. Other changes were made and the altered contract was endorsed by the insured in Texas and by members of the syndicate in New York. Thereafter some of the members of the syndicate assigned their interest in the policy to strangers to the original transaction.

The question was whether the law governing the insurance contract remained unaffected after the change in beneficiaries. The law of Texas required persons taking insurance on the life of another to have an insurable interest in that life. This requirement was not essential to the validity of a policy according to the law applicable to the original contract (*i.e.*, the law of New York). The United States supreme court held that the question whether collection of the proceeds of the policy would be barred by the public policy of Texas was a matter for the courts of that state to decide. A refusal by a state court to enforce a foreign contract, though valid where made, on grounds of public policy would not be an unconstitutional "extra-territorial control of contracts and regulation of business" (*Stoner* v. *N.Y. Life Ins. Co.*, 311 U.S. 464).

In *Maryland Casualty Co.* v. *Pacific Coal & Oil Co.* (312 U.S. 270) the injured person had instituted proceedings against the insured in a state court. While this case was pending, the insurance company brought an action against the insured and the injured claimant to determine the insurance company's liability under the policy. The court held that there was an actual controversy entitling the insurance company to a declaratory judgment under the federal statute, even though the company was not a party to the suit in the state court. To hold otherwise might result in contradictory interpretations of the insurance policy by the federal and state courts.

Labour.—Courts and the labour board continued to make laws amplifying the rights, immunities and duties of labour and labour unions as well as the rights and duties of management. But by far the most outstanding events on the labour front were: (1) Widened federal power to rule working conditions; (2) the supreme court's grant of immunity to labour from antitrust prosecution; (3) broadening of labour board's powers; and (4) the creation of the War Labor board.

Widened Federal Power.—The supreme court decisions on the Fair Labor Standards act went far beyond merely upholding the constitutionality of nation-wide regulation by the federal government of wages and hours. They made clear how few and unimportant, from a practical standpoint, were the remaining constitutional restrictions on governmental regulation of wages, hours and other working conditions. As a result of these supreme court decisions federal authority to regulate wages and hours may be exercised in seven ways which formerly were held obstructed by the constitution. The court ruled: (1) Prohibition of the shipment interstate of goods produced under labour conditions forbidden by the act is within the power of congress under the commerce clause; (2) fixing of wages and hours for employees engaged in producing goods for (interstate) commerce is within the federal power even though this regulation "involves control of intrastate activities"; (3) requirement that employers keep records of wages and hours is a constitutional means of enforcing a valid law, even as to records of intrastate transactions; (4) fixing of wage rates by the federal government is not a denial of due process of law under the 5th amendment; (5) fixing of maximum hours for men as well as women is likewise no violation of the 5th amendment; (6) the Wage and Hour law does not involve an unconstitutional delegation of the legislative power of congress; (7) industry committee and wage-rate fixing procedures need not be technical in order to avoid violation of constitutional requirements of procedural due process of law (*U.S.* v. *Darby Lumber Co.* 312 U.S. 100).

Immunity from Antitrust Laws.—A signal achievement of labour centred about its immunity from prosecution under the antitrust laws as well as freedom from injunction under the Norris-LaGuardia Anti-Injunction act. These laws, the Sherman and Clayton acts, prohibit agreements or combinations in restraint of interstate trade. For long it was insisted that restraints effected by labour groups did not come under the ban of these laws which were historically directed at combines of capital. Furthermore, the Norris-LaGuardia act barred injunctions where labour disputes were involved. In *U.S.* v. *Hutcheson* (312 U.S. 219) the supreme court declared a jurisdictional dispute is not subject to the Wagner act.

A pointed illustration inspired by the Hutcheson decision of how complete an immunity from prosecution of the antitrust laws labour enjoys is the case of *U.S.* v. *Local 807 of International Brotherhood of Teamsters, Chauffeurs, Stablemen and Helpers of America* (118 F. [2d] 684). This case arose out of a demand by the defendant labour union members for payment of $9.42 for each truck unloaded. The claim was forced upon the truck operators "by actual violence to their drivers" and "by threat of such violence." The operators thereupon agreed to pay the money demanded but refused the defendants' "offer" to work in the place of the drivers regularly employed by the operators. This "offer" was interpreted as an invitation to management to "accept or else." Despite this fact, the court held that a labour dispute was involved and therefore the union could not be held either for violation of the antitrust acts or of the antiracketeering law.

The Hutcheson decision, however, did not grant labour carte blanche to violate the Sherman and Clayton acts. It merely decided that agreements between labour groups, even though in restraint of trade, are nevertheless valid. Where, however, the labour group goes beyond this restricted sphere of operation and joins with a nonlabour group (*e.g.*, manufacturers), the lower courts held that the unions might and should be prosecuted. In *U.S.* v. *B. Goedde & Co.* (40 F. Supp. 523), the union refused to install material manufactured in states other than Illinois and to erect prefabricated houses manufactured outside of Illinois, violently assaulted and beat labourers not affiliated with them, threatened violence and bodily harm to members of such persons' families, threatened to destroy property not labelled with the union labels, and forcibly prevented members of other labour organizations from working upon such material. For such acts the unions were held liable to antitrust prosecution or injunction. The immunity of the Norris-LaGuardia act did not apply, since there was no genuine labour dispute. The deciding feature was the fact that the unions had acted in concert with a nonlabour group.

On the other hand, a narrower construction was placed on the term "labour dispute" by the New York court of appeals. In *Opera on Tour, Inc.* v. *Weber* (285 N.Y. 348, 34 N.E. [2d] 349) the plaintiff, a travelling grand opera company, employed live singers but used recordings to produce the musical accompaniment traditionally supplied by an orchestra of instrumental musicians. The American Federation of Musicians, fearing the widespread use of the mechanical reproduction of recorded music, induced the Stagehands' union to order its members to refuse to work for the plaintiff. The six stagehands in the plaintiff's permanent employ struck, and because of the almost universal closed-shop conditions existing in theatres with respect to the Stagehands' union the plaintiff was forced to discontinue operating. In a suit to enjoin the Musicians' and Stagehands' unions, a decree of the special term granting the injunction was reversed by the appellate division in a three to two decision. On appeal to the N.Y. court of appeals, it was held (two judges dissenting) that the Anti-Injunction act does not apply where union activity is for an unlawful objective, and "for a union to insist that machinery be discarded in order that manual labour may take its place and thus secure additional opportunity of employment" is such an objective.

Broadening of Labour Board's Power.—A new era in the administration of the labour act was inaugurated by the supreme court's decision in *Phelps-Dodge Corp.* v. *NLRB* (313 U.S. 177). Not the courts, but only the board may determine matters of discretionary interpretation of the act, and only the board may exercise discretion to determine what "remedies" will effectuate the policies of the act.

In the first case wherein the U.S. supreme court had occasion to consider the board's power to determine the appropriate bargaining unit, it further extended the board's broad authority over matters of representation. In *Pittsburgh Plate Glass Co.* v. *NLRB* (313 U.S. 146) the NLRB proceeded against an employer under section 10(c) of the NLRA for unfair labour practices in refusing to bargain collectively after the board had found the appropriate bargaining unit to be six widely separated plants. The employer appealed on the ground that the board's action was arbitrary in view of the "desire" of a majority of the employees of one plant to be treated as a separate bargaining unit. In sustaining the order, the court held that scattered plants need not be considered individual units when there is identity of working conditions and centralization of management.

With *NLRB* v. *Barrett Co.* (120 F. [2d] 583) the investigatory powers of the NLRB appeared coextensive with those enjoyed by similar agencies under more happily worded statutes. In that case, charges of unfair labour practices having been brought against the defendant company, the NLRB sought to ascertain whether the defendant's operations affected interstate commerce. Upon the defendant's refusal to furnish records believed essential to this determination, the board issued a subpoena *duces tecum* for their production. The defendant refused to comply, contending that the board had no precomplaint power to investigate; whereupon the board obtained from the district court an enforcement order from which the defendant appealed. The court held that the power to subpoena extends to the investigation which is a necessary incident of the board's discretionary power of issuing a complaint.

In *NLRB* v. *Express Publishing Company* (312 U.S. 426), in a five to three decision, the authority of the labour board was seriously curtailed by the U.S. supreme court. Under this ruling the labour board may order companies to comply with provisions of the Wagner act only when unfair labour practices are actually found to exist. Mr. Justice Stone, writing for the majority, agreed that when one has been found to have committed acts in violation of law, he may be restrained from committing other related unlawful acts. But this general principle does not mean that an employer, once having unlawfully refused to bargain with his employees, shall for the indefinite future conduct his labour relations at this risk of being summoned by the labour board on a charge that he has discriminated against a labour union in the discharge of an employee.

Once a labour board order against an employer has been enforced by a court, the employer is subject years thereafter to penalty for contempt of the court's decree if he be found to engage in new unfair labour practices of the same general kind as those prohibited by the board's order. The mere fact that the employer engaged in no prohibited practices for a period of years intervening or that the later unfair labour practice is an entirely new one having no connection with the first is no defense. This was the ruling of the federal circuit court of appeals at New York in a contempt proceeding instituted by the labour board against an employer on the basis of a cease and desist order issued by the board nearly 3½ years before, sustained by the court nearly 3 years before, and complied with by the employer for more than 2 years prior to the new conduct which the board claimed in 1941 constituted a violation of the court's decree (*NLRB* v. *M. Lowenstein & Sons, Inc.*, 121 F. [2d] 675).

War Labor Board.—A new tribunal was added to the many charged with hearing labour disputes, the War Labor board. (*See* DEFENSE MEDIATION BOARD, NATIONAL.)

Rights of Labour.—The supreme court ruled in *H. J. Heinz Co.* v. *NLRB* (311 U.S. 514) that labour is entitled to a written agreement embodying a contract previously reached with the union, and the employer's refusal to sign constituted a refusal to bargain collectively. The high court also reiterated labour's right to picket (*Milk Wagon Drivers Union of Chicago, Local 753* v. *Meadowmoor Dairies*, 312 U.S. 287). However, picketing which is unlawful is not constitutionally protected according to the Wisconsin supreme court. Upon an employer's justified refusal to renew all-union shop agreement, the union called a strike and picketed the employer, advertising that both employer and employees were unfair to organized labour (under Wisconsin statute making it unfair labour practice for an employer to sign an all-union shop agreement except where at least three-fourths of the employees have voted in favour of it). The court held that the board's cease and desist order was proper; constitutional protection of peaceful picketing as an exercise of free speech does not extend to picketing, the purpose of which is unlawful (*Wisconsin Employment Relations Board* v. *Milk and Ice Cream Drivers and Dairy Employees Union, Local No. 225*, 299 N.W. 31 [Wis.]).

Secondary boycotts formerly held to be illegal in most cases since they involved the coercion of innocent third parties were approved where the court could find a unity of interest between the employer of the picketers and the party being picketed. In *People* v. *Muller* (286 N.Y. 281, 36 N.E. [2d] 206) defendants were charged with disorderly conduct for picketing a haberdashery shop in which a burglar alarm system had been installed and was being maintained by a company against which defendants' union was conducting a strike. The placards carried by defendants stated that the maintenance of the alarm was unfair to the union. The contract for maintenance was in force and not subject to renewal at the time, and no work was performed during the period of the strike. The court sustaining a judgment for the defendant, held that such picketing is lawful under the state Anti-Injunction act and is protected by the 14th amendment to the federal constitution.

The right to reinstatement was reaffirmed by the board despite the supreme court's limitations set forth in *NLRB* v. *Fansteel Metallurgical Corp.* (306 U.S. 240).

The labour board's interpretation of the Wagner act since that case, coupled with the strong support already won by the board in the appellate

courts, meant that the two-year-old supreme court decision was restricted to the exact facts of that case: a violent, protracted, sit-down strike involving seizure of the employer's property and discharge of the strikers. On ships as well as in factories the Wagner act was held to confer upon employees the "right" to strike and disobey commands of employer officers without risking discharge. The fact that this disobedience was in violation of a contract was held immaterial by the circuit court of appeals at Philadelphia in a case in which the ship was in port, although not its home port, at the time of the strike (*Southern Steamship Co.* v. *NLRB*, 120 F. [2d] 505). In affirming a labour board order commanding the reinstatement of saboteurs and participants in a strike conducted with violence, the circuit court of appeals at New Orleans decided that substantial evidence supports the board's finding that refusal to reinstate such strikers and saboteurs constituted an unfair labour practice (*El Paso Electric Co.* v. *NLRB*, 119 F. [2d] 581).

Under the Wage and Hour law, labour had been accorded the benefit of numerous favourable decisions extending the applicability of the law to types of employees heretofore never contemplated. The overtime provisions of the statute, however, were the subject of serious conflict of opinion between appellate courts. In *A. H. Belo Corp.* v. *Street and Fleming* v. *A. H. Belo Corp.* (35 F. Supp. 430) the administrator sustained the most serious reversal since the inception of the law. That case, subsequently followed by a number of others, held that employees who were receiving time and a half, their basic rate for hours in excess of the maximum, and a bonus representing the difference between the employees' earnings under the new agreement, and the amount they would have earned prior to the passage of the act, is compliance with the law, since what they received was in excess of the statutory minimum.

Rights of Management.—The supreme court in one of its most significant decisions since the passage of the Wagner act sanctioned the right of management to express "its views on labour policies or problems" without running the risk of violating the Wagner act. After the passage of that act the labour board steadily whittled down the right of management to express its opinion. The theory of the board was that the bargaining position of management was so much more powerful than labour's that intimidation necessarily followed the mere expression of an opinion by the employer (*NLRB* v. *Virginia Electric & Power Co.*, 62 Sup. Ct. 344).

In determining whether management had abused its constitutional right, by resorting to underhanded tactics under the guise of free speech, the labour board was empowered to "look at what the company has said as well as what it has done." But in so determining, the board might not speculate over the "imponderable subtleties at work," which it was not the function of boards or courts to appraise. The board must confine itself to findings of fact, not metaphysical speculation, and to evidence of interference, restraint or coercion, rather than an evaluation of subjective meanings.

On the other hand, the employer had the duty to co-operate in the matter of holding conferences. Unless employees accepted negotiations by mail, the employer had to make his representatives available for conferences at the plant where the controversy was in progress, and at reasonable times and places, so that personal negotiations were practicable. He was not permitted to impose financial hardship on the workers by insistence, for example, upon negotiations in New York city, even though his executive representatives were there (*NLRB* v. *P. Lorillard Co.*, 117 F. [2d] 921).

Duties of Management.—Negotiating and signing a contract with a union does not end an employer's bargaining duty under the Wagner act. The law imposes upon him the duty to negotiate with the union, also, regarding a dispute as to interpretation and application of the contract after it is signed (*Rapid Roller Co. 33 NLRB No. 106*, July 19). Requiring a performance bond from a union so as to render the union liable to legal action for failure to perform was held to be an unlawful refusal to bargain. Management cannot impose any condition precedent to this statutory duty (*Scripto Mfg. Co. 36 NLRB No. 85*, Oct. 27).

Refusal by an employer to embody in a contract a pledge to do what he is obliged by law to do may constitute a refusal to bargain. Evidence of refusal to bargain in good faith is found by the board to consist of: (a) issuance of contradictory instructions to the management bargaining representatives; (b) refusal to agree in advance to embody in a signed contract any understandings that may be reached; (c) failure to submit counterproposals at bargaining conferences on the ground that it is the union, not the company, that is seeking an agreement.

Libel.—The New York supreme court (appellate division) held that an unincorporated labour union was entitled to maintain an action against a newspaper for publishing a defamatory article charging corrupt conduct on the part of union officials. In *Kirkman* v. *Westchester Newspapers, Inc.* (24 N.Y.S. [2d] 860) Kirkman, individually and as president of local union no. 3 of the International Brotherhood of Electrical Workers, together with some 15 other union officials in their individual capacity, brought suit for an alleged libel published by defendants. The statements, claimed to be libelous, charged the union officers, as a class, with exacting oppressive initiation fees and dues from new members, and certain unnamed union officials with "feathering their nests." The court held (two judges dissenting separately) that the plaintiff union, though an unincorporated association, may maintain an action by its president for a libel injuring it in its business and credit; no cause of action, however, was stated in favour of the individual plaintiffs.

In a libel suit growing out of a dispatch based upon a "Washington Merry-Go-Round" column written by Drew Pearson and Robert S. Allen in Sept. 1939, and published in the *Clarksburg* (W.Va.) *Exponent*, a jury held that the column had printed the truth when it reported that Mr. Sweeney was the spokesman for Father Coughlin and that he had opposed the appointment of a foreign-born Jew, Emerich Freed, to the federal bench in Cleveland. In its charge the court reminded the jury that the *Exponent* had a public service to perform in reporting the news, particularly the news of Washington. "In so far as the 'Washington Merry-Go-Round' tells the truth or the substantial truth about the conduct of our president or other officials the 'Washington Merry-Go-Round' is furnishing not only interesting reading but is rendering an important public service," the court said.

Mortgages.—New York passed section 230-b of its Lien law. Prior to its enactment it was in most cases necessary for motor vehicle dealers to comply with section 230-a of the Lien law in order to execute a valid chattel mortgage.

Section 230-a of the Lien law requires the mortgagee to obtain from the mortgagor, a written list of the creditors of the mortgagor. He must then notify each of these creditors of the proposed mortgage and the terms and conditions thereof, when the mortgage is intended to operate as a mortgage upon a stock of merchandise in bulk, or any part thereof. Corporate mortgagors were also required to comply with section 16 of the Stock Corporation law. In effect this section provides that a stock corporation must first have consent to the execution of a mortgage from two-thirds of the holders of the outstanding voting stock, in writing, or by vote at a stockholders' meeting called for that purpose. A certificate that such consent was given must also be filed in each county in which the mortgage is filed. To satisfy these requirements each time a used car was financed proved not only cumbersome but expensive. As a practical matter, therefore, frequently the motor vehicle dealers failed to comply with the requirements of these sections, and more often did not file a chattel mortgage. Obviously, under such conditions, the mortgagee had no protection, whatsoever, not even against creditors of the motor vehicle dealer, to say nothing of the buyer in the ordinary course of trade.

The main purpose behind the passage of this statute, therefore, seemed to be to aid the financiers of used car dealers by providing a cheap, expeditious method of filing. At the same time the statute is also designed to protect bona fide purchasers for value in the regular course of business. Subdivision 6 of the statute provides: "A buyer in the ordinary course of trade, purchasing from a dealer any motor vehicle or motor vehicles covered by any such chattel mortgage or mortgages shall acquire such motor vehicle or vehicles free and clear of the lien or encumbrance of said chattel mortgage or mortgages."

National Defense.—The frenzied preparations for national defense and the all-absorbing effort to win the war added vastly to the controls exercised over practically every phase of U.S. existence. These are briefly reviewed under the following heads: production control, government contracts, transportation, price control, labour, taxation, consumer credit control, trade regulation, freedom of speech, conscription, civil relief to soldiers and sailors and commandeering.

Production Control.—War procurement injected into the economy sudden demands for machines and instruments of war. Because productive capacity at one stage in the production of a key product is often the factor limiting the production of a great range of products, new demands brought about the widespread construction of new productive capacity. Price rises which could not choke off the increase in military demands were met by increasing appropriations while civilian demands were outdone by price rises and by other measures to reduce purchasing power (consumer credit) at the points where it increased the demand for scarce supplies.

But the over-all increase in demand, price rigidities, and eventually price fixing adopted to lessen the burden on fixed income groups, prevented the price mechanism from assuring priority to military demands. Consequently the government was gradually forced to assume responsibility over a widening area of the economy to see that military demands got right of way over civilian needs, even if this meant government seizure and operation of factories.

The enforcement of war regulations were effectuated in the main through indirect sanctions since legislation was unable to keep apace of the rapidly developing events which precipitated the United States into World War II. To insure procurement of the necessary raw materials recourse was had to the technique of priorities, allocations and requisitions. (*See* DEFENSE, NATIONAL, U.S.)

Government Contracts.—To expedite industrial mobilization, the government was authorized to negotiate contracts through bargaining with individual producers. To avoid the possibility of collusion, computations are made on a cost-plus-a-fixed-fee basis and all estimates are carefully scrutinized. Letters of intention are issued by the war and navy departments when lengthy preparations are required "to inform manufacturers of the government's intention to place specified orders with them as soon as funds are appropriated or authorized." To expedite the acceptance of orders by contractors who have to borrow to meet government orders, provision was made for progress payments and advances. The government undertook to indemnify contractors who might be liable to suits for patent infringement as a result of using on government contracts processes not used in their normal operations. Educational orders enabled potential contractors to acquaint their personnel with the prospective work, thereby hastening the transition from peacetime to wartime operation.

Transportation.—Priorities in the shipping field were authorized by the Ship Warrants (Priorities) act, Public Law 173, 77th congress, approved July 14. The U.S. maritime commission is authorized to issue warrants affording certain vessels priority with respect to the use of facilities for loading, discharging and storage of cargoes, procurement of fuel, overhauling and repair.

Authority for the preference and precedence of the transportation of troops and war materials is vested in the president by section 6(8) of the Interstate Commerce act.

Price Control.—The most sweeping price control law in the history of the U.S. appeared when congress passed the Emergency Price Control act of 1942, approved by the president, Jan. 30, 1942. The legislation was primarily intended to avoid the tragic experiences of World War I resulting from inflationary spirals. To keep retail prices in check by force of law and not to rely upon mere voluntary agreements the administration-sponsored measure passed after a six months' battle, but not without two serious concessions to pressure groups: agriculture and labour. Under the new law an Office of Price Administration (*q.v.*) was set up with a one-man head known as the price control administrator.

Labour.—Though labour laws were somewhat relaxed, labour provisions continued as integral parts of government contracts and their violation was heavily penalizable. Under the first War Powers act of 1941, unlimited discretion is vested by executive order in the army, navy and maritime commission to disregard all present laws concerning government contracts

in making such contracts, amending them or settling claims under them. However, this wide discretionary power is limited by the Walsh-Healey act, the Eight Hour law, the Davis-Bacon act, the Kickback law, the Wage and Hour law and the Wagner act, all of which remain fully in force. A prominent instance of this relaxation of labour laws occurred when the president suspended the Eight Hour law as to persons employed by the government on army, navy and maritime commission contracts.

The rapid outbursts of strikes in defense plants brought about the creation of the National Defense Mediation board (*q.v.*). The Defense Mediation board, having no power to compel settlements of labour disputes, failed to relieve strike-bound plants. The result was the creation of the War Labor board, representing the public, management and labour, with absolute power to compel arbitration and to make final determinations in all labour disputes for the duration of the war. (*See* also general section on *Labour*, page 389.)

Taxation.—To aid in financing the huge cost of national defense and the lend-lease program, the Revenue act of 1941 approved Sept. 20 imposed new and heavier taxes designed to raise an additional $3,553,400,000 annually. (*See* TAXATION.)

Consumer Credit Control.—Under an act of Oct. 6, 1917, as amended, during the time of war or during any other period of national emergency as declared by the president, the president may regulate any transactions in foreign exchange, transfers of credit between or payments by banking institutions as defined by the president. A national emergency was declared by the president on May 27, 1941, and on Aug. 9, 1941, using the powers granted him by the 1917 act, an executive order was issued for the regulation of consumer credit. The order empowered the board of governors of the federal reserve system to regulate consumer credit in order to promote national defense and to protect the national economy. (*See* also CONSUMER CREDIT.)

Trade Regulation.—As part of the war effort, several devices were adopted for curbing fifth column and other enemy alien activity exercised through the guise of corporate controls, patent pools and monopolistic practices: (1) the blacklist, barring trade with known enemies, *e.g.*, Latin American and continental, known to be dummies for the axis powers; (2) dropping corporate officials and directors as in the case of General Aniline corporation; (3) prosecutions by the department of justice to break up attempted counterparts of the European cartel system, as in the production and marketing of hormone products, when four chemical corporations and five of their officials were fined a total of $54,000. By signing the consent decrees the companies agreed to cease the practices complained of, which included price fixing and dividing up world markets. The decrees exacted were expected to dry up a rather lucrative source of revenue for nazi agents (*U.S.* v. *Schering Corp. et al.*, Dec. 17).

An essential aspect of trade regulation in connection with the war effort was the problem of defense needs and the antitrust laws. The attorney general outlined a policy to guide the department of justice in an effort to resolve the conflict between the antitrust laws' prohibition against restriction of competition, on the one hand, and the administration's encouragement of concerted activity in the interests of national defense, on the other hand. The policy of the department was that any acts on the part of any unit of industry done in compliance with specific requests from the office of production management or the office of price administration and civilian supply, and approved by their general counsel, would not be the subject of any prosecution under the federal antitrust laws. But, to be free from the risk of proceedings under these laws, an industry committee must not undertake to determine policies for the industry nor attempt to compel anyone to comply with a request or order of OPM or OPA.

Formation of industrial committees at the request of the defense agencies is not to be considered unlawful, nor is co-operation of units of the industry in the selection of representatives or in the activities of the committees. But the committees must confine themselves to collecting and analyzing information and making recommendations. A caution was appended to the attorney general's statement to the effect that the department of justice reserves complete freedom to institute civil actions to enjoin the continuation of acts and practices found not to be in the public interest and persisted in after notice to desist.

On the domestic front three major controversial issues were the subject of acrimonious hearings before the Federal Communications commission (*q.v.*) and of litigation which was in 1941 pending: the network monopoly regulations, the newspaper-divorcement inquiry and the rule banning multiple ownership of stations where duplicating service is involved. In issuing its monopoly order the Federal Communications commission announced its opinion that the chain broadcasting regulations would tend to decentralize the tremendous power over what the public might hear which was lodged in the major network organizations, and would remove existing restraints upon competition without interfering unduly with the operations of the network organizations; also that its chain broadcasting regulations should be applicable to regional as well as national networks. Special circumstances and considerations may be applicable in the case of regional networks, and the commission will examine any further representations on their behalf with especial care.

To effectuate its ban against multiple ownership of broadcasting stations the Federal Communications commission inaugurated the practice of issuing conditional grants to stations which might be involved in the "problem of multiple ownership." (*See* also section on *Trade Regulation.*)

Freedom of Speech.—The supreme court upheld on Jan. 13 the constitutionality of the sweeping Espionage act of 1917 which makes it a crime to obtain or transmit any "information respecting the national defense . . . to be used to the injury of the United States or to the advantage of any foreign nation," friend or foe. Two men convicted in California of violating the act in 1938 by furnishing to the U.S.S.R. naval intelligence reports which they deemed "innocuous" contended that the statute was so broad that it might even proscribe the publication of crop reports by newspapers if a jury held that such information was connected with "national defense" (*Gorin* v. *U.S.*, 312 U.S. 19).

The court said, however, that the provisions of the act were "not simple prohibitions against obtaining or delivering to foreign powers information which a jury may consider relating to national defense." In that case, it added, the law might be invalid. "But we find no uncertainty in this statute," the decision continued, "which deprives a person of the ability to predetermine whether a contemplated action is criminal. . . . The obvious delimiting words in the statute are those requiring 'intent or reason to believe the information to be obtained is to be used to the injury of the United States or to the advantage of any foreign nation.' This requires those prosecuted to have acted in bad faith. . . ."

The impact of the war was felt by radio through tightened controls and more scrutinizing checks in addition to the voluntary undertaking of certain obligations and prohibitions. (*See* RADIO.)

Conscription.—See SELECTIVE SERVICE.

Civil Relief to Soldiers and Sailors.—Courts had several occasions to construe the civil relief provisions of the act of 1940. Compliance with the act, ruled a New Jersey orphans' court, requires the filing in probate proceedings of affidavits relative to military service of all interested parties before default judgment may be entered. Noting that none of the cases under the 1918 Relief act bears upon its applicability to proceedings in a probate court, the court applied a liberal construction of the 1940 act so as to bring a petitioning executor within the definition of a plaintiff and all parties interested in the proceeding as included within the meaning of the term "defendant" in the law. Similarly, a "judgment" is defined as including a decree in the probate court. When an attorney is appointed by the court to represent a party entitled to relief under the statute in cases in which allowances are commonly made, the court saw "no good reason why reasonable compensation should not be awarded." In other cases, the court concluded, the services of an attorney so appointed are to be regarded "as a patriotic duty for which no compensation would be expected."

Procedure for obtaining certificates concerning military service of persons involved in court proceedings under the Soldiers' and Sailors' Civil Relief act was announced by the war department in April. Requests for certificates must be accompanied by the fullest possible information relating to the identity of the person with respect to whom the certificate is desired. Where the request is made by a person other than the one whose military service is in question, it must be accompanied by an affidavit describing the pending court proceeding. (*See* also RELIEF.)

Commandeering.—By the act of Oct. 16 the president, from May 27, 1941, to June 30, 1943, determines the use of military or naval equipment, supplies or munitions or parts, or machinery, tools or materials needed for the manufacture, servicing or operation of such equipments needed for the defense of the United States; and that the need is immediate and will not admit of delay or resort to any other source of supply; and all other means of obtaining the use of such property upon fair and reasonable terms have been exhausted, he is authorized to requisition such property for the defense of the United States upon payment of fair compensation to be determined as provided by the act, and to dispose of such property as he may determine best for the defense of the United States. The act does not include authorization of requisitioning or requiring the registration of firearms possessed by an individual for his personal protection or sport, infringing on the right of individual to keep and bear arms, or authorization of requisition of machinery or equipment of any factory or business which is necessary to the operation of such factory or business. A report of operations under the act shall be made to congress from time to time, at least once every six months.

Aliens.—See IMMIGRATION AND EMIGRATION.

Patents.—Activity of the department of justice and a number of cases brought to the limelight the fact that in most industries profitable operation was in greater or less degree dependent upon the use of machines or processes which were the subject of patent rights, and in many, the product itself or a part of it might be patented.

Serious problems arose from the fact that every holder of a patent enjoys a legal monopoly for a limited period. Because of his right to withhold licence from others, the unrestricted opportunity for new firms to enter into the various industrial fields may be considerably curtailed. Furthermore, inroads upon the free competitive market are brought about when groups are able to entrench themselves in power through combinations of patents and systems of restrictive licensing which enable them to achieve far-reaching control over production prices and access to industry. For developments see *Trade Regulation* page 329.

Public Utilities.—A hydro electric power project to be operated in connection with two licensed projects located on government land and on a stream that provides most of the water for navigable rivers was held subject to the jurisdiction of the commission (*In re Pacific Gas & Electric Co.*).

The Federal Power commission also has authority to require a power company to apply for licence to operate and maintain a dam on a river found to be navigable although the dam was built in reliance on a ruling of the secretary of war, made in connection with another project, that the river was not navigable (*Pennsylvania Water & Power Co.* v. *Federal Power Commission*).

A holding company may acquire its preferred stock by purchases on exchange (*In re Electric Bond & Share Co.*). Accordingly, orders of the Federal Power commission disallowing a proposed increase of rates and charges for natural gas sold by corporations engaged in the business of purchasing, transporting and selling natural gas by contract to public utilities in different states, where it is sold to ultimate consumers for domestic, commercial and industrial use, are not invalid (*Mississippi River Fuel Corp.* v. *Federal Power Commission*, C.C.A. 8).

Provision of the 1935 Holding Company act granting circuit court of appeals exclusive jurisdiction to review a rate order of the Federal Power commission is controlling over a provision of the 1929 act granting district court jurisdiction on review. The Federal Power commission does not have jurisdiction under section 20 of act to regulate rates of a power company operating in interstate commerce in the absence of a finding that the states concerned are unable to agree through their properly constituted authorities on charges to be exacted (*Safe Harbor Water Power Corp.* v. *Federal Power Commission*).

Securities.—A gratuitous solicitation of offers to buy, although entirely without authority from the issuer of the securities, was held to be an underwriting and, therefore, subject to the Securities and Exchange commission. In *SEC* v. *Chinese Consolidated Benevolent Assn., Inc.* (120 F.

[2d] 738) the defendant benevolent association urged the public purchase of unregistered bonds of the Chinese government. Although the defendant acted gratuitously and without direct authority from the issuer, the Securities and Exchange commission claimed that the defendant was an underwriter within the statutory definition of "any person who . . . sells for an issuer." A sale is defined to include "solicitation of an offer to buy." The commission sought unsuccessfully an injunction against the association. On appeal the circuit court held that the defendant was an underwriter and, hence, the SEC was entitled to an injunction.

An option to purchase securities which were not registered with the SEC is not illegal and void as contrary to public policy. The Securities act of 1933 requires the registration of securities to be sold to the public, granting certain exemptions based on the type of securities and the size of the offering. The purpose of the legislation was the protection of innocent purchasers, and the act sets forth a standard of conduct in the issuance and sale of securities, and also minima for disclosures to the public. For failure to register with the SEC the act imposes sanctions and raises certain liabilities to purchasers of the securities. Section 5 makes it unlawful to make use of the mails or any means of interstate transportation or communication to effect the delivery or sale of an unregistered security or the transmittal of an inadequate prospectus. Section 12 authorizes recovery of the consideration paid where the securities are sold in violation of section 5 or, in effect, of section 11. A fine of not more than $5,000 or imprisonment of not more than five years is the penalty imposed by section 24 for wilful violation of any of the provisions of the act. Despite the use of the term "unlawful" in section 5 and the imposition of fine or imprisonment, the court stresses the purpose of the act—the protection of purchasers—and holds that the illegality which raises liabilities to purchasers and even merits criminal penalties is not a defense to an action by one who will not be injured by the enforcement of the contract, where such enforcement would not be damaging to the public. In *A. C. Frost & Co.* v. *Coeur d'Alene Mines Corp.* (61 Sup. Ct. 414) the petitioner was the assignee of an option for the purchase of all or any part of 1,300,000 unregistered treasury shares of the defendant mines corporation. After the petitioner had purchased 165,000 shares defendant repudiated the option and refused further delivery. In his suit for damages, the supreme court of Idaho, finding that "all the stock offered for sale amounted to public offerings" and that means of interstate communication and transportation were used, held that failure to register rendered the contract illegal and void as contrary to public policy. On appeal the U.S. supreme court, for the purposes of the decision, accepted the Idaho court's finding that the evidence was sufficient to show a public offering, but held that the contract, otherwise legal and fair on its face, was not unenforceable.

Social Security.—Held under the Social Security (*q.v.*) act were: (1) Directors of banks performing services on committees of banks are employees for social security purposes; (2) employees of beauty service company as well as employees of water company in connection with operation or maintenance of its ditches, canals, reservoirs or waterways used partly or wholly for supplying or storing water for both domestic or farming purposes; (3) cost plus contractor—individuals performing services for a company in construction of a federal defense project under a cost-plus-a-fixed-fee contract with the navy department are considered employees for social security tax and the contracting company is an independent contractor; (4) a clothing salesman working on commission basis in assigned territory is an employee within the meaning of the Pennsylvania Unemployment Compensation act (*Leinbach Co.* v. *Unemployment Compensation Board of Review*, 22 A. [2d] 57); (5) all plants of a manufacturing corporation being synchronized units of work production system, constitute a single "establishment" within the meaning of provision of the Michigan Unemployment Compensation act disqualifying the employee from receiving benefits when unemployment is due to labour activity in progress in the establishment in which he is employed (*Chrysler Corp.* v. *Smith*, 297 Mich. 438).

Held not under the Social Security act were: (1) Services performed by employees on farms owned by an employer in connection with processing, grading and baling of cigar-leaf wrapper tobacco for market constitute "agricultural labour" for purposes of social security; (2) attorney appointed for collection of delinquent taxes; (3) musicians were held not to be employees of restaurant owner and therefore not under Unemployment Compensation act (*Unemployment Compensation Commission of Wyoming* v. *Mathews*, 111 P. [2d] 111); (4) hospital organized as nonprofit membership corporation is exempt as employer from New York Unemployment Insurance law when no part of its net earnings inures to the benefit of any private shareholder or individual although the majority of the patients pay part or all hospitalization charges (*in re Doctors' Hospital Inc.*); (5) one who is unemployed due to a labour or trade dispute is not entitled to the benefit of unemployment insurance (*Bodinson Mfg. Co.* v. *Calif. Unemployment Comm'n.*, 109 P. [2d] 936 [Calif.]); (6) employee member of a union in a closed-shop logging company was held not entitled to unemployment benefits where stoppage was caused by a labour dispute under the Oregon Unemployment Compensation act (*Latham* v. *Unemployment Compensation Commission*).

Taxation.—*See* TAXATION.

Torts.—Inducing one to breach a contract is an actionable wrong even though the one so induced was under no duty to perform. In *Philadelphia Record Co.* v. *Leopold* (40 F. Supp. 346) plaintiff, a newspaper publisher, invited readers and the public to participate in a puzzle contest known as "rebus games," thereby expecting to increase the circulation of the newspaper. Defendants were engaged in the business of rendering advice and assistance, for a price, in the solution of such puzzles. Plaintiff, seeking a permanent injunction against defendants' activities, was upheld in his contentions that this activity on the part of the defendants tended to destroy the effectiveness of the contest, that it discouraged contestants who had not subscribed for defendants' services from continuing in competition, that it vitiated the integrity of the contest and induced breaches of plaintiff's rules which it cannot detect. The professional puzzle solvers' solicitation and sale of answers to puzzles printed in the newspaper of the plaintiff constituted an inducement to a breach of contract, notwithstanding the fact that the contestants were under no duty to perform.

Despite the fact that a theatre ticket is merely a revocable licence an owner does not have the right to eject a patron without cause. In *Cummings* v. *St. Louis Amusement Co.* (147 S.W. [2d] 190 [Mo. App.]) plaintiff was forcibly ejected from defendant's theatre by defendant's employees and brought this action for damages for assault and battery. Defendant offered testimony attempting to justify the ejection on the ground that plaintiff was creating a disturbance. It was held erroneous for the trial judge to instruct the jury that the question of plaintiff's conduct was immaterial and that a theatre owner could eject a patron at any time with or without cause.

Trade Regulation. *Justification for Regulation.*—Control of trade policies has long been the subject of acrimonious debate in congress and before the courts. For years it has been held that the legislatures could fix prices only if the commodity was "affected with a public interest." No end to difficulty was introduced in the attempt to ascertain when commodities were affected with a public interest. When regulation was earnestly needed and the commodity could hardly be said to be affected with a public interest, such regulation was justified on the ground that emergency required it. In the absence of an emergency, the commodity could not be regulated under police power unless so "affected with a public interest."

For this reason the supreme court of Nebraska held unconstitutional its statute which provided that no private employment agency should collect from an applicant as compensation for its services, more than the aggregate of a stated registration fee and 10% of the first month's wages. The U.S. supreme court, however, overruled the long-standing doctrine that to be regulated a business must be affected with a public interest. The court, in fact, says that an industry is subject to control when such regulation is for the public good, and the wisdom, need and appropriateness of such legislation should be left where the constitution intended these to be left, the states and congress (*Olson* v. *Nebraska*, 313 U.S. 236).

Jurisdiction of the FTC.—The Federal Trade commission became increasingly more powerful after the passage of the Wheeler-Lea amendment to the Federal Trade Commission act gave it control over unfair and deceptive practices as well as over unfair competitive methods. To justify the commission's interference, however, (1) the practices must occur in interstate commerce, (2) the proceedings must be in the public interest and (3) before the commission can issue its cease and desist orders its findings must be based upon substantial evidence as that phrase is understood by U.S. courts (not speculative or meagre testimony). The following cases illustrate these principles.

(1). The FTC has no power to control intrastate activities merely because these affect interstate commerce. In *Federal Trade Commission* v. *Bunte Bros., Inc.* (312 U.S. 349) the FTC found that the defendant was engaged in unfair methods of competition in the sale of candy which burdened interstate commerce by reducing the sales of candy manufacturers doing an interstate business. Although the defendant's business was carried on entirely within one state, the commission ordered it to cease and desist from its unfair practices. The supreme court held that the defendant's activities were not "in interstate commerce" and were, therefore, not subject to the Federal Trade commission's jurisdiction. The court emphasized the fact that the interpretation of the law sought by the government would give the federal agency sweeping control over "myriads of local businesses in matters heretofore traditionally left to local custom or local law." Such an inroad, it concluded, "ought to await a clearer mandate from congress."

Control may, however, be exercised if it is apparent that the activities in question bear such a close relationship to interstate commerce that their control is appropriate to its protection. This was the situation in *Ford Motor Company* v. *FTC* (120 F. [2d] 175). The court held that the use of advertising, which leads purchasers to believe they are paying 6% interest on instalment purchases of automobiles, when in fact they are paying approximately 11½% simple annual interest, is an unfair method of competition in violation of the Federal Trade Commission act. The fact that no damage has been shown is no defense since the purpose of the act is to afford a preventive remedy, not a compensatory one. Jurisdiction of the FTC has been held to extend to local agreements intended to affect intrastate and interstate prices. Neither the reasonableness of the prices thus established by concerted action nor the claim that such an agreement is necessary to preserve the business will justify such a combination in restraint of trade (*Standard Containers Manufacturers' Ass'n* v. *Federal Trade Commission*, 119 F. [2d] 262).

(2). What is a public interest was stated in the *Pep Boys—Manny, Moe & Jack* v. *Federal Trade Commission* (122 F. [2d] 158). In that case, a retailer of radio supplies, requested the circuit court of appeals to review and set aside an FTC order enjoining as an unfair and deceptive practice in commerce, the petitioner's use of the trademark "Remington," which was the registered trademark of well known noncompetitors (Rem'ngton-Rand, Remington Arms, etc.). The circuit court held that a substantial and specific public interest being involved, the purchasing public is entitled to protection against this type of deception.

(3). To support an FTC order, substantial evidence is necessary. In one of the few cases lost by the FTC (*Kidder Oil Co.* v. *FTC*, 117 F. [2d] 892) the circuit court of appeals in Chicago admonished the FTC that it may not bar a practice without substantial evidence of its illegality. In the significant case of *FTC* v. *Scientific Mfg. Co., Inc.*, the FTC sought to enjoin the sale and distribution of a publication containing special articles—not advertising—expressing the publisher's honest opinion that cooking in aluminum utensils was deleterious to health, the commission maintaining the statements were false and misleading. The publisher was neither engaged nor materially interested in the manufacture or sale of the products concerning which he expressed his opinion. The commission relied for its authority on the Wheeler-Lea amendment to the Federal Trade Commission act, which empowers it to curb false and misleading advertisements where material (that is, where likely to be relied upon by any purchaser) as well as all unfair and deceptive practices in interstate commerce. In setting aside this order the circuit court held that if the commission's interpretation of its powers were allowed, the Federal Trade commission would become the absolute censor of the truth of all printed matter moving in interstate commerce.

Lawrence, William (1850–1941), U.S. Episcopal bishop, was born May 30 in Boston, Mass. He was bishop of Massachusetts from 1893 until his retirement in 1926. He established the church pension fund, a plan to provide old-age pensions for retired Episcopal churchmen. The fund's assets were rated at more than $30,000,000 in 1933. Among his later works are: *The New American* (1929) and the *Life of Phillips Brooks* (1930). He died in Milton, Mass., Nov. 6. (See *Encyclopædia Britannica.*)

Lead. A rough estimate of world lead production in 1940 placed it at 1,773,000 metric tons, an increase of 3% over 1939. Distribution of the output is shown in the table.

World Production of Lead
(In thousands of metric tons)

	1929	1937	1938	1939	1940
Australia	177.3	234.4	235.7	252.4	275.0
Belgium	62.2	88.0	90.5	96.0	55.0
Canada	148.0	186.4	185.7	177.9	210.0
Germany	97.9	162.4	171.7	181.4	200.0
Burma	81.5	78.9	81.4	78.6	83.0
Mexico	248.8	231.2	242.7	215.7	196.3
Spain	133.3	30.0	36.0	27.0	40.0
U.S.S.R.	6.2	55.0	69.0	75.0	75.0
United States	624.2	426.3	344.4	381.4	389.2
World Total	1,756.8	1,719.6	1,704.2	1,722.7	1,773.0
Ex. U.S.	1,132.6	1,293.3	1,359.8	1,341.3	1,384.0

The mine production of lead in the United States in 1940 was 457,392 short tons, while refinery output was 433,065 tons, to which is to be added 83,563 tons from foreign ores, 16,551 tons from foreign base bullion, and 16,588 tons from scrap, making a total refinery output of 549,767 tons, an increase of 7% over 1939, most of which was due to the increased lead from imported ores. The recovery of secondary lead in 1940 amounted to 260,346 tons, about half of which was in antimonial lead, with the remainder divided about equally between metal and other alloys.

Imports of lead into the United States in 1940 included 111,300 tons in ores, 19,624 tons in bullion, and 151,568 tons of metal, a total of 282,492 tons, as compared with only 86,883 tons in 1939. These figures are for total or general imports; imports for consumption were considerably lower, at 130,812 tons in all forms.

Exports dropped sharply from 1939 to 49,079 tons in 1940, about equally divided between metal from domestic and foreign sources, and an additional 15,604 tons of exports has been accounted for in manufactures exported during the year.

Adding to the above figures for mine output, total imports and secondary recovery, 4,667 tons of increase in smelter and refinery stocks and deducting total exports and 132,661 tons increase in stocks in bonded warehouses, gives a total available supply of 808,585 tons. Actual consumption was estimated at 782,000 tons, leading to the inference that consumers' stocks had been increased during 1941 by the difference between these two items.

There was little data at hand with respect to 1941. Mine output in the United States during the first 10 months was 379,600 tons, indicating about 460,000 tons for the year, which is only a minor increase over 1940. Imports for consumption during the first three quarters of 1941 were 311,216 tons, as compared with 130,812 tons for the full year of 1940, but exports continued at about the 1940 rate. Imports from Mexico and South American countries were being increased.

Aside from the United States, 1941 data were received only from Mexico, where the production to the end of July was down to 98,450 metric tons, against 120,867 tons in the same period of 1940. (C. A. Ro.)

League of Nations. The political activities of the League of Nations were greatly curtailed in 1941. But a nucleus remained at Geneva, still the League headquarters, and at Princeton, N.J., and in Washington, D.C., to carry out League obligations under various conventions, and to continue important technical work and collect material for postwar reconstruction.

The economic and financial section at Princeton, generously aided by a $50,000 grant from the Rockefeller foundation, continued its inquiries into the principles of income tax practice and legislation, to the advantage of governments building up or revising their tax systems. Key publications of the Economic Intelligence service appeared, the chief being a world economic survey. New studies were started, *e.g.* the lessons to be learned from successes and failures of financial and economic policies during the interwar period, with special attention to economic depressions. A volume was published on the part played by Europe in the trade of the world, from the angle of the production of vital raw materials and foodstuffs.

As a result of World War II, questions of health and nutrition and the campaign against drugs became of grave concern. League assistance was forthcoming. The epidemiological services, both at Geneva and Singapore, were maintained, greater use being made of wireless. Both neutral and belligerent countries kept in closest touch. The invaluable supply of serum standards throughout the world was continued, partly from the Copenhagen Serological institute, although in German occupation, and chiefly by the London institute. The health organization at Geneva received requests from governments, regarding contagious diseases and every aspect of public health. It possessed a wealth of experience and material in regard to questions of nutrition, curtailed only by lack of staff and finance, which were at the disposal of all health administrations.

The social section carried on work upon child welfare and protection of the family. Early in 1941 the successful collaboration with China was wound up, large quantities of medical supplies and transport being handed over to the Chinese. The task of settling the Assyrian Christians, from Iraq, on the Khabur in Syria was also brought to an end, the final report showed that the health and material welfare of the settlers were highly satisfactory. In London, the commissioner for refugees reported on the work achieved, from the human standpoint, and for legal protection and emigration. Considerable assistance was given to private organizations for refugees.

Nearly all governments sent in their annual drug reports. An important branch of the Permanent Central board was opened at Washington. The secretariat kept all governments posted in the latest information on the illicit traffic, texts of new laws, etc. The drug situation in Europe and the far east was kept constantly in review.

Notices of withdrawal, and the occupation of certain countries, adversely affected contributions to the League's budget at first. But during 1941 the situation steadily improved. The 1941 budget was cut down to about £500,000. Owing to early and full payment of contributions by a majority of member states, the financial situation, later in the year, was sound.

As a result of the occupation of Holland by the Germans, the Permanent Court of International Justice at the Hague was unable to function. The president and registrar of the court took up their residence in Switzerland.

(*See* also DRUGS AND DRUG TRAFFIC; MANDATES; REFUGEES.)
(M. FE.)

Leahy, William Daniel (1875–), U.S. naval officer, was born at Hampton, Ia., on May 6. He was graduated from the U.S. naval academy in 1897, was commissioned ensign in the same year and became captain in 1918. In 1912 he was chief of staff of the Nicaraguan occupation armies and in 1916 chief of staff in the Haitian campaign. In 1927 he was made chief of the naval bureau of ordnance, and was commissioned rear admiral in 1930. He became commander of the destroyers' scouting force in 1931 and chief of the bureau of navigation in 1933. Leahy thus became the first officer in U.S. naval history to be chief of the two important bureaus of ordnance and navigation, as well as chief of naval operations, an appointment he received in 1937. He was commissioned vice-admiral in 1935 and admiral in 1936.

Upon his retirement from the navy in 1939, he was appointed governor of Puerto Rico. In Nov. 1940, President Roosevelt

named him ambassador to the French government at Vichy. In this post, throughout 1941, Leahy had the difficult and at least partially successful task of persuading Pétain's government, by various degrees of economic and diplomatic pressure, not to become totally immersed in Hitler's "new order."

Leather. The leather industry was greatly affected by wartime conditions throughout 1941, but significant accomplishments were achieved. Production was increased in the United States about 35% over 1940 without sacrifice of normal quality standards and without sharp price increases. It is estimated that United States tanneries as a whole operated at between 90% and 95% of theoretical capacity limits throughout the year to meet the demands for huge quantities of many types of leather for military uses and to satisfy a greatly increased demand from civilian customers.

The steady increase in demand for leather was accompanied by difficulties in obtaining prime raw materials. This resulted in new research by the industry to increase productive efficiency; to conserve existing materials; and to develop new materials for tanning or new methods of using materials not commonly used before the emergency.

Statistics of the industry outside the United States were lacking for 1941 because of the war. Those pertaining to operations in the United States were somewhat incomplete, and because of changed conditions not strictly comparable with previous years.

Raw hide and skin production of the United States remained in 1941 on a level with other years, but imports were substantially increased to meet the greater demand for leather.

United States imports of cattle hides in 1941 were at the estimated rate of better than 7,000,000 hides a year, compared with average imports in the period of 1935–39 of slightly more than 3,000,000 yearly. Calfskin imports reached an estimated 3,000,000 skins in 1941 which was slightly below the 1935–39 average of 3,200,000 skins annually. The 1941 rate of sheep and lambskin importations was estimated at 45,000,000 skins yearly, which is more than double the 1935–39 average of slightly more than 21,000,000 skins annually. The 1935–39 average annual importation of goat and kidskins was slightly more than 43,000,000 skins. Estimated importations in 1941 amounted to more than 45,000,000 skins.

Research.—Continuous research was conducted by the industry to discover means of conserving available supplies of raw stock and tanning materials. This resulted in increased efficiency in the operations of some tanneries and a general trend to eliminate wasteful procedures wherever they were uncovered.

Most important research of 1941 was conducted in the field of tanning materials. Tanning material supplies were directly affected by three factors: Wartime shipping difficulties which cut off sources of supply of numerous important materials; the increased demand by war industries for certain materials necessary to 1941 methods of leather manufacture; and the need for more tanning materials by the leather industry itself, because of increased production.

Chromium salts are extensively used in making shoe upper leather, some sole leather and various specialty leathers. Because of the excessive use of chromium in war industries the tanning industry was confronted in 1941 with an impending shortage of serious proportions in chrome ore for making chrome tanning liquors. This threat revived intensive study of other forms of mineral tanning, particularly of processes of tanning leather with iron salts. At the end of the year, it was announced that investigation of steel mill waste liquors had clearly indicated the possibility that a valuable supply of materials suitable for chrome-iron tanning might be found in this waste matter. About 500,000,000 gal. of the waste are available annually and the content of such liquors is essentially 3% to 4% of 100% sulphuric acid, and from 15% to 18% of ferrous sulphate. Leather tanned experimentally with these waste liquors proved satisfactory in numerous early tests.

There were also some shortages of chemicals used in disinfecting hides and skins and in preparing raw stock for tanning. These shortages were largely overcome by adoption of other materials for the purpose after continuous study of available materials.

Vegetable tanning processes used for making sole leather were revised during 1941 because of shortages of materials such as gambier, sumach, valonia and myrobalan. About 65% of all vegetable tanning materials used by United States tanners must be imported, but many of these are obtained from sources which are still open, provided ships and cargo space are available. The industry found reasonable substitutes for all of the unavailable vegetable tanning materials except valonia, which is not considered too essential, and which is not normally used by many tanners.

There was greater interest in and considerable study of new sources of tanning materials, and as many of the common forms of plant life are rich in tannin content, it was believed that further experiments would result in greater use of tanning materials to produce leather of satisfactory quality.

The industry did not experience a general shortage of oils and greases used in leather manufacture, but some items were not available, or were available only in restricted quantities. Substitutes were employed for materials which could not be obtained in required quantities.

In the United States severe shortages were encountered in the field of aniline dyes because defense agencies took control of practically the entire supply of aniline oil, toluene, acetic acid anhydride and formaldehyde. These same materials are also used by the leather industry in synthetic tanning materials and in disinfectants. In most instances, reasonably satisfactory substitutes were found for available materials, but the industry experienced increasing difficulties by the end of the year in connection with dyestuffs and finishing materials.

Government Regulations.—Government regulations in the United States had some effect on the leather industry in 1941. In December the Office of Production Management (*q.v.*) suspended trading in all wet-salted, dry and dry-salted foreign cattle hides, calfskins and kipskins. The suspension was lifted two weeks later under restrictions which required that imports must be made by government agencies and supplies afloat sold to those agencies.

The Office of Price Administration (*q.v.*) established price ceilings on domestic hides and skins in an order issued in June and later amended several times. Ceiling prices established by the order followed closely the existing market price of the hides and skins in general.

In December the OPA established price ceilings on leather, using the average market prices prevailing in the period of Nov. 6 to Dec. 6 as a basis for the new price limits.

Price ceilings on some 1,800 fats and oils were set by the OPA on a basis of market prices prevailing Nov. 26. (Later amendments to the price order raised the ceiling on some items.) Included in the price-controlled fats and oils were a number used extensively by the tanning industry.

At the end of 1941 several moves of major importance were made voluntarily by the industry to conserve supplies of raw stock, tanning materials and finished leather that might be needed for war purposes or for supplying Allied nations. These included, among many things, a voluntary "freezing" of supplies of certain sole leathers suitable for army shoes, and in some instances restricted deliveries of certain upper leathers needed for the same purpose and also of a few special types of leathers.

Previously the government had taken control of all supplies of sheep shearling leathers and had diverted those leathers to the sole use of the military forces, for making aviators' jackets, and other items of clothing and special footwear.

Foreign Trade.—Foreign trade of the U.S. industry was greatly affected by the war. Imports of hides and skins increased, while exports were low. Imports of major tanning materials which were available also increased through the year, as did imports of finished leather from South American sources. Leather exports were also higher and were estimated to be about 35% above 1940 levels.

World production of leather was believed to have been increased from 10% to 25% during 1941, but tanners in many countries were confronted with more serious problems of obtaining stocks and materials other than those in the United States. It was believed the quality of leather produced in several leading countries declined appreciably below usual standards, and also below the standards upheld in the United States and Great Britain. (*See* also SHOE INDUSTRY.) (R. B. B.)

Lebanon: *see* SYRIA AND LEBANON.

Lebesgue, Henri (1875–1941), French mathematician, was born in Beauvais, France. He became professor in the Collège de France in 1921 and a member of the French Academy of Sciences in 1922. Lebesgue devised a method in mathematics for finding a measure of an arbitrary set of points and his name was given to this method. Lebesgue's death was reported from Vichy, France, Aug. 6.

Leblanc, Georgette (1875–1941), French actress, who starred in many of Maurice Maeterlinck's plays, was the daughter of a wealthy Rouen ship-owner. She was well launched on a career as a singer and actress when she met Maeterlinck at a supper party. A companionship of 20 years followed, during which time she played principal roles in his dramas, and helped him with his writing.

This period she described in her book, *Souvenirs, My Life with Maeterlinck*. She first toured the United States in 1912, in Maeterlinck's *Pelléas et Melisande*. Her death in Cannes was announced in a Vichy dispatch, Oct. 28.

Leblanc, Maurice

(1864–1941), French writer, was born Dec. 11 in Rouen, France. He studied in England and Germany, worked in his father's shipyards in Rouen and then left for Paris to become a writer. His first novel, *A Woman* (1887) met with little success. But young Leblanc, at the behest of a newspaper editor, wrote a crime story called *The Arrest of Arsène Lupin* (1906). The hero, an impudent gentleman burglar who evaded all police snares, caught the popular fancy and the young French writer was launched on a successful career as an author of crime stories. The Arsène Lupin stories made Leblanc internationally famous and the books were widely translated. Among his best-known works are: *Arsène Lupin, Gentleman-Cambrioleur* (1907), *Arsène Lupin Contre Sherlock Holmes* (1908), *Les Trois Crimes d'Arsène Lupin, Le Triangle d'Or, L'Ile aux Trente Cercueils* and *Les Trois Yeux.* M. Leblanc died in Perpignan, Nov. 6, less than two weeks after the death of his sister, Georgette Leblanc (*q.v.*).

Leeb, Wilhelm Joseph Franz Ritter von

(1876–), German general and field marshal, was born Sept. 5 in Landsberg-am-Lech, Bavaria. He joined the army at the age of 19, later serving in the German expeditionary force to China during the Boxer rebellion. Upon his return to the Reich, he entered the war academy, and served on the German general staff during World War I. Following the war, he was engaged in quelling communist uprisings in Bavaria, after which he rose to the rank of general. In 1935 he was made one of the three army group commanders of Germany, being assigned to group no. 2, based at Cassel. During Hitler's purge of army officers in 1938, von Leeb resigned his post, but was later recalled to take command of an army of occupation in Czechoslovakia. In 1940 he commanded the German troops on the Rhine, storming through the Maginot line after the collapse of the French armies in the north. When German armies invaded the U.S.S.R. in 1941, he was assigned command of the German armies assaulting Leningrad. Marshal von Leeb's armies pushed back the Russian forces virtually to the gates of Leningrad in the fall of 1941. But in December, the Russians counterattacked, threatening his armies with encirclement. After he lost the initiative on the Leningrad front, von Leeb was reported to have offered his resignation to Hitler.

Leech, Margaret Kernochan

(1893–), U.S. author and wife of the late Ralph Pulitzer, publisher, was born Nov. 7 in Newburgh, N.Y. A Vassar graduate, Miss Leech turned to writing as a career and was the author of *The Back of the Book* (1924), *Tin Wedding* (1926), *Anthony Comstock,* written in collaboration with Heywood Broun (1927) and the *Feathered Nest* (1928). Her *Reveille in Washington,* published in Aug. 1941, was a graphic and realistic picture of life in Washington, D.C. during the American Civil War. Miss Leech spent five years searching through old Washington newspapers, journals and letters to collect material and anecdotes for the book, which became an immediate best-seller.

Lemons and Limes.

The indicated U.S. production of lemons Dec. 1, 1941, was estimated by the department of agriculture as 14,580,000 boxes, 70 lb. net to the box. California is the only state in the United States that produces lemons. The 1940 crop was 17,099,000 boxes, that of 1939 was 11,938,000 boxes, and the ten-year (1930–39) average was 8,815,000 boxes.

The U.S. lime crop is produced in Florida. The crop was estimated Dec. 1, 1941, by the department of agriculture as 120,000 boxes compared to 80,000 boxes in 1940, and 95,000 boxes in 1939, and a ten-year average of 37,000 boxes. Owing to the war, very little data on production of lemons and limes in other countries was available in 1941. For the season of Jan.–Aug. 1941, Cuba reduced its export of limes to the United States to 419,000 lb. (705,000 lb. in 1940). Mexico was reported to have increased its production of limes 65% since 1935. Mexican lime production in 1940 was 945,000 bu. (S. O. R.)

"Lend-Lease" Act: *see* DEFENSE, NATIONAL (U.S.); GREAT BRITAIN: *History;* INTERNATIONAL LAW; LEND-LEASE ADMINISTRATION, OFFICE OF; NEUTRALITY.

Lend-Lease Administration, Office of.

The lend-lease act was enacted by the U.S. congress March 11, 1941, after it had been recognized that the countries resisting aggression were fighting potential enemies of the U.S.A. Thus the lend-lease act established the principle that the United States should be the arsenal of the democracies. From the passage of the bill until May 2, 1941, operations were carried on by the staff of the president's liaison committee, headed by Major Gen. James H. Burns. This committee had been created by the president Dec. 6, 1939 to co-ordinate foreign and domestic military purchases. It was formally dissolved April 15, 1941.

On May 2, 1941 President Roosevelt issued an executive order establishing the division of defense aid reports within the Office for Emergency Management of the executive office of the president. Major Gen. James H. Burns was designated executive officer of the division, assisted by the former staff of the president's liaison committee. The division of defense aid reports was set up to provide a single channel for the clearance of actions and reports under the lend-lease act, for the co-ordination of the processing of requests for aid under the act, and for maintenance of a system of reports and accounts approved by the bureau of the budget. It was also instructed to serve as a clearing house of information for agencies participating in the lend-lease program, and as a central point to which all representatives of foreign governments requesting lend-lease aid should bring applications.

In due course, the need for broadening of the central administrative office's function and responsibilities became apparent, and, by executive order issued Oct. 28, 1941, the division of defense aid reports was dissolved, and the Office of Lend-Lease Administration was created, with E. R. Stettinius, Jr. (*q.v.*) as its head. The lend-lease administrator was formally charged with responsibility for making allocations, transfers and retransfers, and for exercising any power or authority conferred upon the president under the lend-lease act.

He was made primarily responsible for co-ordinating and expediting the procurement and delivery of lend-lease goods and services.

Actual purchasing operations under the act are not a function of the central administrative office, but are carried on by the various government agencies best qualified to do each specific job. The Office of Lend-Lease Administration works very closely with each of the procurement agencies—war, navy, maritime commission, treasury (procurement division), and the department of agriculture—in determining whether items formally requested by foreign governments are lend-leasable. If a requisition for an item is approved as part of a previously agreed-upon program, an allocation of funds is made, and the procurement is then undertaken by the department concerned in accordance with its normal procurement procedure. The necessary priorities and transportation problems are worked out with the assistance of specialists in these various fields. The transfer and export of any lend-lease material is normally authorized by the lend-lease administrator at the same time as its procurement.

The lend-lease act provides that the president shall report to congress every 90 days on operations under the act. In 1941 three such reports were published.

To the end of 1941, two appropriations had been made by congress specifically for lend-lease purposes, the first on March 27, 1941, in the amount of $7,000,000,000, and the second on Oct. 28, 1941, in the amount of $5,985,000,000—a total of $12,985,000,000. As of Nov. 30, out of these appropriations, 61% or $9,186,000,000 had been allocated to the procuring agencies for specific projects. As of the same date, these agencies had obligated 57% of their allocated amounts, or a total of $5,243,000,000. Total aid rendered under the lend-lease act during the same period amounted to approximately $1,202,000,000. This figure included $723,000,000 of defense articles transferred to foreign governments, $140,000,000 of defense articles awaiting such transfer or use by foreign governments, $92,000,000 of articles in process, $79,000,000 for testing and reconditioning of merchant and naval vessels, $75,000,000 for expansion of lend-lease production facilities, and $92,000,000 for transportation of defense articles to combat areas.

Countries in the lend-lease area at the end of 1941 included:

Argentina	Egypt	Nicaragua
Bolivia	El Salvador	Norway
Brazil	Free Belgium	Panama
British Empire	Free France	Paraguay
Chile	Greece	Peru
China	Guatemala	Poland
Colombia	Haiti	Russia
Costa Rica	Honduras	Turkey
Cuba	Iceland	Uruguay
Dominican Republic	Mexico	Venezuela
Ecuador	The Netherlands	Yugoslavia

The Office of Lend-Lease Administration in 1941 also had the responsibility of using lend-lease machinery in the handling of requisitions of foreign countries for the purchase of specific items on a "cash reimbursement" basis. This procedure provided for the procurement of an item in precisely the same way as that used for other lend-lease operations, with the exception that the foreign government deposited cash with the United States treasury against the value of the goods to be purchased, before delivery. As of Nov. 30, 1941, various foreign governments had made such deposits in a total amount of $8,420,124.

As a third function, the lend-lease office assists foreign governments in the lend-lease area in making direct cash contracts with U.S. suppliers for the purchase of defense articles, and in expediting deliveries.

Funds provided under lend-lease in 1941 permitted China to make improvements on the Burma road to increase the traffic capacity of that artery appreciably, while a roughly parallel railway was also being extended for the transportation of lend-lease goods. Many hundred British merchant and naval ships were repaired, refitted and supplied with stores from U.S. shipyards in 1941. U.S. armament in the form of aircraft, tanks and guns was shipped in large quantities to the middle east in 1941, while shiploads of food went to the British Isles for maintenance of civilian health and morale. Special lend-lease representatives in Great Britain, U.S.S.R., China, Iceland, Iran, North Africa and Egypt were maintaining close supervision of the disposal and use of lend-lease material in 1941. (*See* also AGRICULTURE; DEFENSE, NATIONAL [U.S.].) (E. R. Ss.)

Leonard, Eddie (LEMUEL GORDON TONEY) (1875–1941), U.S. stage and vaudeville star, was born in October in Richmond, Va. After a brief career in professional baseball, Toney, who had a natural flair for entertainment, joined a minstrel troupe and changed his name to Eddie Leonard. By the 1920s he had made fame and fortune on the stage and the whole country was singing his famous compositions, "Ida, Sweet as Apple Cider," and "Roly Boly Eyes." After the advent of the talking movies, blackface comedy became a dying art, and Eddie Leonard retired. In 1929 his savings were wiped out by the depression, and Leonard ventured into night-club singing and restaurant management. He died in New York city, July 29.

Leprosy. Although leprosy is prevalent among the people living on the island of Cebu, for some reason one town of about 6,500 people has the low rate of 0.45 per 1,000, while two towns of similar size have rates of 19.7 and 17.6 per 1,000. The people living in the first town had fewer communal customs than the inhabitants of the other two.

Children living with a leprous parent are likely to contract the disease (25% to 75%). In Brazil where there are approximately 35,000 lepers, preventoria are being constructed to care for 3,250 children so that they may be separated from their leprous relatives.

A study of 249 lepromatous (nodular) cases whom the authors had been able to follow from the time of the appearance of very early lesions resulted in the observations that 65% to 68% first exhibited some type of neural involvement. In about one-half of these the first evidence of disease was the enlargement of nerve trunks and in one-third the first change noticed in the skin was the loss of sensibility even though there may have been no visible evidence of a skin lesion. The average duration of the nerve phase was 3.4 years.

The tendency for spontaneous arrest or improvement in leprosy makes the evaluation of treatment difficult. A study of untreated leprosy was made in Nigeria. A village of 1,800 people was surveyed in 1937. Leprosy was seen in 118 people and detailed clinical notes made. Although no treatment was given, on re-examination three years later, 23% were improved and 33% were unchanged.

Further reports were made on the use of diphtheria toxoid by the author who first described the method in 1940. In experience gained in treating 193 asylum cases beneficial results were reported in the early and moderately advanced neural and in early lepromatous cases. Another member of the same group writing at a later date was less sanguine about this method of treatment but believed that it might prove useful. As opposed to the results reported by the originator of the diphtheria toxoid treatment, a leprologist on another continent tried the method on 19 cases for several months and found no benefits derived. The treatment caused much discomfort and was unpopular with the patients. Other types of treatment reported by other investigators were naphthalan oil baths and sunlight, an "antileprosy serum" and a vaccine made of certain fractions of the tubercle bacillus. Results were inconclusive. Twelve patients treated by surgical removal of solitary lesions were followed from 1½ to 7 years and 11 remained well.

In 1939 it was reported that by the use of an antigen made of a culture of *Treponema pallidum* (spirochete causing syphilis) in performing Wassermann tests on blood of leprous patients false positive results were greatly reduced. Several have attempted to repeat this work and results in general were confirmatory. One group examined 37 sera from leprous individuals which were positive with ordinary antigens and found that only six reacted positively when the spirochetal antigen was used.

Studies of the pathology of human leprosy continued. A report of probably the youngest person with leprosy to be autopsied was made of a child aged 17 months who died of pneumonia. Another pathologist made a detailed study of the blood vessels in leprous lesions. The study covered ten autopsies and 67 biopsies. In 32 cases some involvement of the blood vessels was found, usually with bacilli seen in the endothelial (lining) cells. Phosphatase determinations were made on sera from 102 leprous people simultaneously with nonleprous individuals in the same environment. No abnormality was noted. Of 70 lepers examined relatively low ascorbic acid (vitamin C) levels were discovered in 46.

Workers still hopeful of success continued attempts to grow the leprosy bacillus (*Mycobacterium leprae*) on artificial culture media but no enthusiastic claims of success were recorded during 1941. One investigator since 1932 attempted to culture 89 leprous nodules and 35 blood specimens from patients with leprous fever on more than 100 different types of media. Another bacteriologist made similar attempts using 50 different types of media and making 1,718 inoculations watching some tubes for three years. A third investigator used 109 different media combinations, many of which were suitable for culturing human cells, but no multiplication of bacilli was seen.

Failure to reproduce human leprosy in an animal which could be used for experimental purposes has always been a challenge to workers in leprosy. One group reported continuing previously recorded attempts to infect fowls. After seven transfers from fowl to fowl they believed that human leprosy bacilli were actually multiplying in the breast muscles. In Brazil an attempt was made to produce the disease in a species of hamster not previously used (*Cricetus cricetus*). Results were inconclusive. In Indo-China a monkey was injected 18 times with material from a case of human leprosy. Slowly resolving lesions occurred in the inoculated skin, but no evidence of generalized leprosy was seen.

Lettuce. The U.S. lettuce crop in 1941 was 23,388,000 crates[1] from 158,770 ac. and was valued at $39,136,000 for the crop year. The 1940 crop was 22,754,000 crates from 145,870 ac. and was valued at $22,754,000; the ten-year (1930–39) average, 19,941,000 crates from 159,980 ac., valued at $28,414,000. The 1941 yield was 147 crates per acre, compared with 156 in 1940 and a ten-year average of 125 crates per acre.

[1]Western crates containing 48 to 72 heads and weighing approximately 70 lb.

(S.O.R.)

Levinson, Salmon Oliver (1865–1941), U.S. attorney, was born Dec. 29 in Noblesville, Ind., the son of a poor Jewish emigrant from Germany. He attended the University of Chicago for three years and was graduated from Yale in 1888. Three years later he was admitted to the bar. During the early part of World War I he called upon pro-Ally and pro-German leaders to demand peace and seek for a negotiated settlement. After the war he advocated the entry of the United States into the League of Nations, but he later denounced the league when it failed to outlaw war. In 1921 he worked with the U.S. delegation to the disarmament conference. In 1927 he helped in the drafting of what was later the Kellogg-Briand pact. He also tried to organize world opinion against the Versailles treaty and offered his own plan for readjustment of German reparations, Allied and international debts and world peace. In 1929 he established the $55,000 William Edgar Borah Outlawry of War foundation at the University of Idaho. He died in Chicago, Feb. 2.

Levitzki, Mischa (1898–1941), U.S. concert pianist and composer, was born May 25 in Kremenchug, Russia of naturalized U.S. parents. A child prodigy of remarkable talent, the young Mischa mastered the violin at the age of three and the piano at six. Astonished by his ability, his parents sent him to Warsaw, where he studied piano under Michalowski. In 1907 they returned to the United States and Mischa became the pupil of Sigismund Stojowski. The lad then went to Berlin to study under Ernst von Dohnányi and subsequently they appeared in joint concerts in Berlin, Vienna and Budapest. Levitzki made his first New York appearance in 1916 and established his reputation as an artist. His compositions include "Arabesque Valsante," "The Enchanted Nymph," "Gavotte," "Valse Opus 2," "Valse de Concert" and "Cadenza to Beethoven's Third Concerto in C Minor." He died Jan. 2 at his home in Avon-by-the-Sea, N.J.

Lewis, Dean De Witt (1874–1941), U.S. surgeon, was born Aug. 11, at Kewanee, Ill. He was graduated from Lake Forest university in 1895 and received his medical degree from Rush Medical college in 1899. He became an instructor in anatomy at Rush college in 1900 and professor of surgery there in 1920. From 1925 to 1939 Dr. Lewis was professor of surgery at Johns Hopkins medical school and surgeon-in-chief at Johns Hopkins hospital. He worked extensively in nerve, brain and abdominal surgery and was credited with devising the "cable transplant," a method of joining the severed ends of a nerve. Dr. Lewis, who resigned his posts at the Johns Hopkins medical school and hospital in 1939, died in Baltimore, Oct. 9.

Lewis, Mary Sybil (1900–1941), U.S. opera singer, was born Jan. 7 in Hot Springs, Ark. After a varied singing career that included solo work in church choirs and musical shows, including the "Ziegfeld Follies," she made her operatic debut at the Metropolitan in New York city in Jan. 1926, as Mimi in *La Bohème*. Music critics were lavish in their praise of her histrionic ability and her ability to "put a song over," although they were lukewarm in praising her voice. She temporarily forsook opera after her marriage to Michael Bohnen, Metropolitan basso, in 1927. Subsequently she returned to the concert stage and sang on the radio and in motion pictures. She died of a heart attack after a prolonged illness in New York city, Dec. 31.

Libel: *see* LAW.

Liberia, an independent Negro republic on the west coast of Africa, bounded N.W. by Sierra Leone and in the hinterland and E. by French West Africa. Area, *c.* 46,000 sq.mi.; pop. (est. Dec. 31, 1938), 2,500,000. Chief town: Monrovia (cap., 9,700). President in 1941: Edwin Barclay; language, official: English; religion: Christian (Protestant).

Although increasing attention continued to be paid to health and education in 1941, complete absence of railways and inefficiency of roads acted as a brake on progress. A main arterial road was in course of construction. After 1938, selected students from the high school were sent to the Achimota agricultural college for training. The chief products were rubber and palm kernels; large deposits of iron and other ores are known to exist, but they had not been worked in 1941.

Education.—(1938): schools 161; scholars *c.* 10,000.

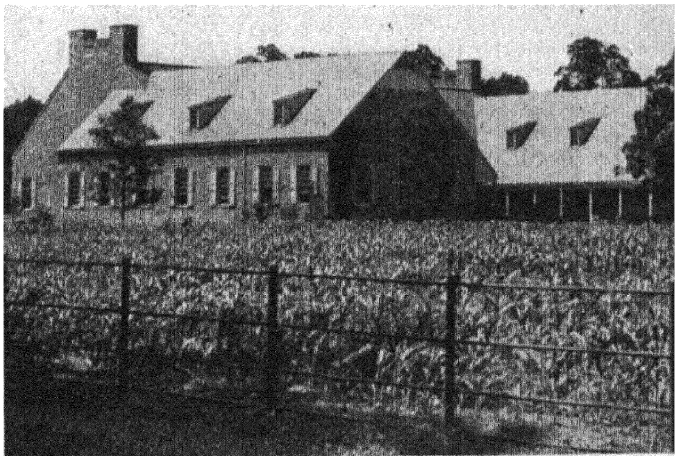
Banking and Finance.—In 1940: revenue and expenditure, est. $675,200; public debt (Jan. 1, 1939), external $U.S.1,602,000; internal $Lib.241,864. Currency: Liberian dollar, exchangeable at a fixed rate of $4.80 = £1 sterling in 1941.

Trade and Communication.—Overseas trade, 1939: imports, $2,002,864; exports $2,714,133. Communications, 1939: roads suitable for motor traffic, *c.* 180 mi.; shipping entered, 1939, 1,390,535 tons.

Agriculture and Mineral Production.—In 1938 (export figures in metric tons): rubber, latex, 1,457; rubber, crepe, 1,456; piassava, 5,008; coffee, 892; cocoa, 549; palm kernels (1939) 5,300; gold 59 kg.; ivory, 9,147 lb.; palm oil, 162,757 imperial gallons.

Liberty Ships: *see* SHIPBUILDING.

Libraries. Inevitably the part that books could play in preparation for defense and, after Dec. 7, in the prosecution of the war, occupied the attention of librarians in



THE FRANKLIN D. ROOSEVELT LIBRARY at Hyde Park, N.Y. was dedicated by the president June 30, 1941

the United States. A survey of the resources of research libraries in the fields of science, technology and economics, the provision by public libraries of technical books to meet the needs of workers in defense industries, the formation of information centres for civilian defense, co-operation with the libraries being organized in camps and elsewhere for the army and navy and maintained at government expense were some of the special activities in which libraries were engaged in 1941. Plans were under way late in the year for a "Victory Book Campaign," under the direction of Althea H. Warren, librarian of the Los Angeles Public library, to collect 10,000,000 good books for the armed forces to supplement the existing book collections provided by the army and navy. The campaign was sponsored by the American Library association (*q.v.*), the American Red Cross (*q.v.*) and the United Service organizations (*q.v.*).

Certain British libraries suffered heavily in air raids, but there was almost no information as to the extent to which European libraries were damaged or destroyed or looted by the Germans. The Rockefeller foundation made a grant of $20,000 for the purchase of microfilm copies of current periodicals that might be needed by institutions in Europe and Asia. It seemed important that irreplaceable materials for research be protected in case of air raids on the U.S. Some libraries moved their more valuable books and manuscripts to places of comparative safety. Plans were being made by many libraries in areas that might be bombed.

In May representatives of large university and reference libraries met in New York to discuss problems of library specialization at the research level, including the place of microfilms and the central storage warehouse for little-used books. The importance of the national union catalogue in the Library of Congress was emphasized.

The establishment of the Biblioteca Benjamin Franklin in Mexico City to serve as a centre of information about American institutions and culture was another evidence of co-operation with Latin America. The library, under the supervision of the American Library association, was to be organized by Harry M. Lydenberg. During 1941 a survey of Canadian libraries in wartime was made, at the request of the Rockefeller foundation, by Charles F. McCombs of the New York Public library. The Rockefeller foundation and the Carnegie corporation continued their generous support of library activities in many fields. Lists of these grants were to be in their annual reports. The Carnegie corporation appropriated (1940–43) $190,000 for the purchase of books for colleges for Negroes ($100,000) and for state colleges ($90,000). The corporation also provided funds for one year for an experimental division of library co-operation in the Library of Congress. A "Memorandum on Library Co-operation," prepared by Herbert A. Kellar, the director, was issued in September. The splendid library of English and American literature gathered by Owen D. Young was presented to the New York Public library as the joint gift of Mr. Young and Dr. Albert A. Berg. In 1940 Dr. Berg gave to the library his own books and those of the late W. T. H. Howe. The Young collection was to be added to these. The Yale University library acquired the important Adrian Van Sinderen collection of Walt Whitman.

The increasing cost of cataloguing books of all sorts with the fullness of detail exemplified in the printed catalogue cards of the Library of Congress had for years been a cause of concern to many librarians. Attention was focused on the problem by the publication of the revised *A.L.A. Catalog Rules*. The fundamental question was admirably discussed by Dr. Andrew D. Osborn of the Harvard College library in a paper, "The Crisis in Cataloging," published in the *Library Quarterly* for Oct. 1941.

Library Training and Personnel.—The 1940–41 report of the board of education for librarianship (A.L.A.) listed 30 schools of various types accredited by the board as meeting its standards; all were connected with teaching institutions. The total enrolment March 1, 1941, was 1,927, including 187 advanced and 209 special or nonmatriculated students. This was a decrease of 232 as compared with 1940. Registration in the library schools might drop further during the war years. For the duration libraries expected to find it difficult to replace members of professional and clerical staffs. Men of military age were expected to be called to service with the armed forces, and many women, particularly in the clerical grades, preferred the higher salaries to be obtained in war industries.

Size of Collections or Statistics of Libraries.—Nineteen libraries in 1941 contained more than 1,000,000 volumes each: the Library of Congress, 6,102,259 volumes (June 30, 1940); the New York Public library, 4,351,136 volumes (comprising reference department, 2,831,334 volumes; circulation department, 1,421,004 volumes; and Municipal Reference library, 98,798 volumes) (Dec. 31, 1941); Harvard university, 4,265,729 volumes (June 30, 1941); Yale university, 3,074,817 volumes (June 30, 1941); Cleveland (Ohio) Public library, 2,112,129 volumes (Dec. 31, 1940); Chicago (Ill.) Public library, 1,892,016 volumes (Dec. 31, 1940); Columbia university (New York city), 1,844,611 volumes (June 30, 1941); Boston (Mass.) Public library, 1,704,729 volumes (Dec. 31, 1939); Los Angeles (Calif.) Public library, 1,641,195 volumes (June 30, 1940); University of California, 1,501,473 volumes (comprising 1,124,858 volumes at Berkeley and 376,615 volumes at Los Angeles) (June 30, 1941); University of Chicago, 1,330,152 volumes (June 30, 1941); Carnegie Library of Pittsburgh (Pa.), 1,319,610 volumes (Dec. 31, 1940); Cincinnati (Ohio) Public library, 1,202,472 volumes (Dec. 31, 1940); University of Illinois, 1,262,046 volumes (June 30, 1941); Brooklyn (N.Y.) Public library, 1,170,280 volumes (June 30, 1940); University of Michigan, 1,134,052 volumes (June 30, 1941); Cornell university (Ithaca, N.Y.), 1,094,117 volumes (June 30, 1941); University of Minnesota, 1,061,965 volumes (1940); Detroit (Mich.) Public library, 1,012,328 volumes (June 30, 1940). Two university libraries, Princeton and Pennsylvania, and two public libraries, Milwaukee and St. Louis, have more than 900,000 volumes each.

These figures were very uncertain standards of comparison because of differences in methods of counting and because public libraries with many branches contained many copies of new and standard books.

Library Buildings.—The larger university and research libraries in the United States double in size every 20 years. Growth of collections outstrips construction of buildings. Even farsighted librarians planning buildings erected after 1900 failed to foresee the geometrical rate of increase, and there were few buildings more than ten years old that were not overcrowded. Because of the high costs of construction and administration, it was not practicable to build new libraries every generation. The question of storage space and the probable future rate of growth was discussed by Keyes D. Metcalf, director of Harvard University library, in his contribution, "Some Trends in Research Libraries," to *W. W. Bishop: a Tribute, 1941*.

One solution suggested was a storage library for little-used books. Harvard, the Boston Public library and other libraries in the Boston region organized the New England Deposit library, a nonprofit corporation. A suitable building with a reading room was under construction at Allston, Mass., on land given by Harvard university. Maintenance charges and construction costs were to be met by income from the rental of space to the participating libraries. The Iowa State college, Ames, constructed a steel storage building (cost, about $20,000; capacity, 150,000 volumes) to house seldom-used books.

The new library for rare books and manuscripts at Harvard university, made possible by the gift of Arthur A. Houghton, Jr., of Corning, N.Y., was completed late in the year and the opening planned for the early part of 1942. Houghton, himself a collector of distinction, was appointed curator of the rare book collection in the Library of Congress in 1940. The Houghton library, as it was to be called, was planned for the safe storage, convenient consultation and attractive display of Harvard's treasures.

The Franklin D. Roosevelt library at Hyde Park, N.Y., was dedicated by the president on June 30. The library, organized primarily to house the official and private papers of President Roosevelt, was built on land given by the president and his mother at a cost of $350,000 contributed by citizens of the entire nation. The library was under the administration of the archivist of the United States, and the director, Fred W. Shipman, was formerly on the staff of the national archives.

Librarians.—Harry M. Lydenberg retired from the directorship of the New York Public library Oct. 1 and was succeeded by Franklin F. Hopper, chief of the circulation department of the library since 1919. Francis R. St. John, assistant librarian of the Enoch Pratt Free library of Baltimore succeeded Hopper. William Warner Bishop, librarian of the University of Michigan since 1915, retired on July 20. Dr. Warner G. Rice, professor of English in the university, was appointed director of the library. Dr. Bishop was president of the International Federation of Library Associations from 1931 to 1936.

Adam Strohm, librarian of the Detroit Public library since 1913, retired on July 1 and was succeeded by Ralph A. Ulveling, associate librarian. On March 1 Matthew Dudgeon retired from the librarianship of the Milwaukee Public library after more than 20 years' service. Dr. Victor H. Paltsits, keeper of manuscripts and chief of the American history division of the New York Public library, well-known to bibliographers and historians, retired June 30 after a long and distinguished career. Miss Isadore G. Mudge, known to all librarians as the compiler of the indispensable *Guide to Reference Books* (6th ed., 1936), retired July 1 after 30 years of service as reference librarian of Columbia university. Charles E. Rush resigned the librarianship of the Cleveland Public library to become director of libraries at the University of North Carolina from Sept. 1. On Nov. 28 Clarence S. Metcalf, business manager of the Cleveland Public library since 1924 and acting librarian since Rush's resignation in March, was appointed librarian for three years. Max Farrand, director of research of the Henry E. Huntington library and art gallery (San Marino, Calif.), retired June 30, and on Nov. 18 Frederick P. Keppel, friend of libraries and scholarship, retired from the presidency of the Carnegie corporation, a position he had filled for 19 years with great distinction. Theodore Wesley Koch, librarian since 1919 of Northwestern university (Evanston, Ill.), died on March 23 only a few months before his retirement age. Bibliographer of Dante and able librarian, Koch was a man of varied gifts; his numerous writings are evidence of his literary ability and the Charles Deering library at Northwestern a monument to his artistic taste. Josephine Adams Rathbone, before her retirement in 1938 vice-director of the Pratt Institute School of Library Science, died on May 17. On May 31 came the news of the death of Augustus H. Shearer, librarian of the Grosvenor library (Buffalo) since 1917. Harriet C. Long, librarian of the Oregon State library (Salem) since 1930, died on July 4. Frank P. Hill, librarian of the Brooklyn Public library from 1901 to 1930, died on Aug. 24 at the age of 86. Earlier, Dr. Hill organized the Newark (N.J.) Free Public library.

Charles W. David was appointed director of libraries at the University of Pennsylvania, a position created to co-ordinate the work of the general library of the university, the departmental libraries and the Philadelphia Bibliographical Center. Mrs. Loleta Dawson Fyan took up the duties of state librarian of Michigan on June 11. Mrs. Fyan, a trained and experienced librarian, succeeded a long line of political appointees. (*See* also AMERICAN LIBRARY ASSOCIATION; CATHOLIC LIBRARY ASSOCIATION.)

Cannon, ed., *Guide to Library Resources for National Defense*, rev. ed., (1941); R. L. Vormelker, ed., *Special Library Resources* (1941). (C. F. McC.)

Great Britain.—In 1941 the use made of the libraries of Great Britain was greater than ever before. It was obvious throughout the country that the public saw, in the library, an institution of incalculable value freely providing, on the one hand, books of a recreational nature to afford some relief from the strain of war, and, on the other, books and documents of information and ideas, so vitally necessary to a free people in time of war. The circulation of books in public libraries increased in some places by as much as 100%, in many others by 25% to 50%.

The large number of important libraries destroyed or badly damaged by the enemy included those of Birkbeck college, Birmingham Natural History and Philosophical society, Bristol university (anatomical department), City of London college, Goldsmith's college, King's college (London), Manchester Literary and Philosophical society, Royal Empire society, University college (London), and certain sections of the British museum. The upper floors of the National Central library were entirely burnt out and many thousands of books destroyed, including the whole stock of the adult class department and many volumes of series and periodicals. At Plymouth, both the central public library and the Plymouth proprietary library were destroyed, and among many other public libraries which suffered, the most serious losses occurred at Coventry, Hampstead, Liverpool, Lowestoft, Shoreditch and Yarmouth.

Although properly organized general libraries for the forces had not in 1941 been established on any large scale, considerable progress was made in the provision of reading matter for men and women of the three services. The Service Libraries and Books fund, set up at the beginning of the war, had by the end of 1941 already collected more than 10,000,000 books, magazines and periodicals, while most of the public libraries of the country made special provision for camps or isolated units within their area and encouraged all members of the forces to make full use of the various services rendered to the community generally. (D. C. H. J.)

Libya: *see* ITALIAN COLONIAL EMPIRE; WORLD WAR II.

Liechtenstein, an independent but tiny European state, northeast of Switzerland, to which it is united by a customs union. Area 65 sq.mi.; pop. (est. 1940) 11,500. Chief town, Vaduz (capital, pop. 1,710). Ruler: Prince Franz Joseph II, b. 1906, was given ruling authority by his 84-year old uncle, Prince Franz I, on March 30, 1938 and after the latter's death was crowned prince on May 29, 1939. Language, German; religion, mainly Roman Catholic; products: corn, wine, fruit, wood and marble; revenue (1939) 2,099,300 Swiss francs (nearly $500,000), 31% of which was derived from the sale of postage stamps to collectors all over the world. Lime. Production of lime in the United States in 1940 rose to a new record high of 4,886,929 short tons, against 4,254,348 tons in 1939. Of the total 71% was quicklime and 29% hydrated lime; agricultural uses took 8%, building 21%, metallurgical uses 20%, chemical uses 34% and refractory uses 18%. Small amounts of lime are imported, but are more than offset by exports. (G. A. Ro.)

Lindbergh, Charles A. (1902–), U.S. aviator, was born Feb. 4 in Detroit, Mich. (See *Encyclopædia Britannica.*) He returned to the United States from England in 1939 and resumed his work for the U.S. air corps. Meanwhile, he publicly advocated strict U.S. neutrality in World War II. In April 1941, he joined the America First committee, and later that month he resigned his commission in the air corps, declaring that President Roosevelt's remarks concerning his loyalty left him "no other alternative." On Sept. 11, 1941, Lindbergh charged at an America First rally in Des Moines that "the three most important groups which have been pressing the United States toward war are the British, the Jewish and the Roosevelt administration." Although this remark was widely circulated as anti-Semitic, Lindbergh's associates strongly denied that it was to be interpreted as such. After the Pearl Harbor incident in Dec. 1941, Lindbergh said in part: ". . . we must meet it (the war) as united Americans regardless of our attitude in the past . . . our country has been attacked by force of arms and by force of arms we must retaliate." On Dec. 30, 1941, Lt. Gen. Arnold of the U.S. air corps said that Lindbergh had volunteered his services to the air force and urged acceptance of the flier's offer.

CHARLES A. LINDBERGH addressing a rally of the America First committee Aug. 9, 1941 at Cleveland, Ohio

Linen and Flax. Development of new material sources was the principal interest in the linen and flax industry of the world during 1941. The cutting off of the older flax-growing countries from world trade had previously resulted in a series of experiments in other areas of the world to produce an adequate supply of flax for threads and fabrics manufactured in Great Britain and in the U.S. During 1941, the new production was reported as exceeding expectations.

New Zealand.—New Zealand increased its original acreage of 100 to 14,000 during the fall of 1940 and to 25,000 in 1941. Annual production was about 5,000 tons but this was expected to increase to 15,000 within two years. The plantings were confined to the South island. North island crops did not prove successful. The cost of this promotion was estimated at approximately £NZ1,000,000 ($3,250,000 U.S. currency), including the construction and equipment of 17 retting plants, where the straw was tank-retted. The entire output was contracted for by the British government.

Peru.—In Peru, a considerable increase was expected over the 1940 production of about 75 tons of good grade fibre and an equal quantity of tow and waste. As in the New Zealand movement, a Belgian flax expert was engaged by the Peruvian government to take charge of its initial experiments and an agricultural association of Peruvian growers was successful in securing government aid in erecting additional flax processing machinery to take care of the anticipated crop. The cost would eventually be repaid by the growers by an increased charge of about 20% for the use of government-owned processing machinery. The crop went to the United States, which provided the seed.

Ireland.—In Ireland, almost 16,000 ac. were devoted to flax growing in 1941, eight times as much as three years before and a substantial increase over 1940 (10,000 ac.). Producers were guaranteed a price of 26 to 32½ cents a pound and the increase in acreage and production necessitated installing additional scutching mills and other processing equipment. About 1,200 workers were expected for the winter (1941–42) operations. The crop was sold largely to Northern Ireland, since Eire had no actual spinning mills. The flax harvest for 1941 for the first time saw the general use of mechanical pulling. What five men could ordinarily do in five days, one machine accomplished in three hours. In the 1941 harvest, in Ireland, 160 machines were used.

Egypt.—The Egyptian flax crop was a substantial contribution to the

new supply of fibre. The acreage of 31,000 planted was more than three times the 1939 planting, and the profitable results (1,800 kg. of straw and 300 kg. of seed per ac.) promised that the acreage would be increased materially during 1942, the estimate being made of 50,000 ac. All of it was contracted for by Great Britain.

Spinning and Weaving.—The spinning and weaving of linen products was progressively difficult. As early as Jan. 1941, Ulster mills were reported as turning to cotton and a month later, it was said that the usual demand for dress linens was lacking, because of "great prominence given in the United States to the attractive designs in cotton and rayon." Later in the year, an improved market for table damask developed from the United States but buying was concentrated on the more popular-priced merchandise, cheap towelling, etc. A new field of demand came from ecclesiastical sources. Wide linen sheetings formerly coming from Belgium were sought in Irish markets. A reflection of wartime was seen in the report printed on June 15, that the "Flax Control board is preparing to give facilities for the release of material required to replace goods lost in last month's blitz." Of the total Irish manufacturing capacity, linen thread covered 60%, and 50% of all linen production went for government requirements. While demand was slow from Latin America and the British colonial areas, buyers from the United States in the latter half of the year created an active market in the better grades of fabrics, with prices 150% above prewar levels. To the Irish market, a demand at this price level indicated that linen fabrics had not lost their popular appeal, since similar products of American rayon and cotton had not increased more than 20% in price during the same period. The preference for linen was emphasized by an increase of 20% in retail sales in the United States. The fine linen trade at the end of 1941, believed it saw the last of its activity for the duration as far as Britain and its allies were concerned.

In the nazi-dominated world, Belgian flax-weaving mills in Dec. 1941 had been authorized to increase their production from 30% to 70% of capacity. The raw material, fibre-flax straw, was being sent from France and the Netherlands, the shipments from France being estimated at 150,000 tons for the year. (I. L. Bl.)

Lions Clubs, International Association of.

The International Association of Lions Clubs is an association of service clubs, the membership of which is made up of business and professional men. It was formed in Chicago, Ill., on June 7, 1917, and founded by Melvin Jones.

The association in 1941 was composed of approximately 4,300 Lions clubs with a total membership of 150,000 in eight countries: Canada, China, Colombia, Costa Rica, Cuba, Mexico, Panama and the United States. The 1941 annual international convention was held in New Orleans, La.

The purpose of Lions clubs is to recognize community needs, and meet those needs by independent effort or through co-operation with other agencies. They are nonpolitical, nonsectarian. Their activities, supervised by club committees, have eight classifications: Boys and girls; citizenship and patriotism; civic improvements; community betterments; education; health and welfare; safety; sight conservation and blind. From May 1, 1940 to April 30, 1941, a total of 58,789 separate activities were reported by Lions clubs to their international office.

The *Lion Magazine*, issued monthly, is the official publication of the association. International president for the 1941–42 fiscal year was George R. Jordan of Dallas, Tex. Headquarters of the association are at 332 South Michigan avenue, Chicago, Ill., and directed by Secretary-General Melvin Jones. (M. Jo.)

Liquors, Alcoholic.

The most important alcoholic liquors are whisky (or whiskey), gin, rum, brandy and liqueurs. Whisky is distilled from a fermented mash of grains. In American whiskies either corn or rye grain predominates. Scotch whisky is made from barley malt which has acquired during its preparation the "smoky" aroma which is characteristic of it.

Gin or geneva had its origin in Holland. English gin—which was at first a copy of the Dutch product, but is being produced under a modified method—dominates not only the British, but also the general world market. London dry gin is by far the most popular variety. However, the production of gin in the United States is much greater than in England.

Brandy, or more specifically "grape" brandy, was recognized for a long time as almost an exclusive product of France. In particular, the product originating from the Charente district, and which alone is entitled to the designation "cognac," has been considered as a standard for this type of beverage. However, a quite fine quality of grape brandy has been produced in California.

The United States has been for many years the country of greatest production and consumption of potable spirits. Because of existing political conditions, production in practically all foreign countries has been considerably curtailed and consumption also materially reduced. Records for late years have not been obtainable.

Whisky was in 1941 by far the predominant alcoholic beverage in the United States. In the fiscal year ending June 30, 1941, 121,726,000 American proof gallons (or tax gallons) were produced, as against 99,000,000 gal. in the preceding year. The production of brandy was 25,373,000 gal.; rum, 2,615,000 gal.; gin, 5,180,000 gal. and diverse other spirits 20,202,000 gal.

Almost the entire whisky production was concentrated in five states, Kentucky accounting for 56,936,000 gal.; Illinois 21,902,000 gal.; Indiana 20,762,000 gal.; Pennsylvania 9,069,000 gal.; Maryland 5,793,000 gal. and all other states 7,265,000 gal.

The apparent consumption of all alcoholic liquors amounted to 153,480,000 gal. at various proofs ranging predominantly from 86 proof to 100 proof. These consumption figures are expressed in American "wine gallons," which means the volume of liquid as bottled at the respective alcoholic strengths. The various types of liquors making up this total consumption were: American (domestic) whisky 119,911,000 gal.; imported whiskies, 9,725,000 gal. (Scotch 7,479,000 gal., Canadian 2,172,000 gal.); gin, 13,900,000 gal.; rum, 3,635,000 gal.; brandy, 2,482,000 gal.; cordials and liqueurs 3,834,000 gal.

The gin in 1941 was practically all of domestic origin. About 1,801,000 gal. of the rum came from Puerto Rico, and a total of 2,739,000 from outside the United States. There were 502,000 gal. of the brandy imported. (*See* also Brewing and Beer; Wines.)

The United States has been producing for years most of the whisky, with Scotland next, followed by Canada and Ireland. Considerable quantities are turned out in Australia and a few other countries. Production and export in Scotland and Ireland were maintained in 1941, although on a reduced scale. Exports from the United States materially increased with a considerable broadening of the field. (A. J. Li.)

List, Siegmund W. W.

(1880–), German army officer, was born in Oberkirchberg, Bavaria. He attended the military academy in Munich, graduating in 1898, and was commissioned a lieutenant in the Bavarian army in 1900. He attended the artillery and engineering school, 1902–04, and the Royal Bavarian Military academy at Munich, 1908–11. In 1914 he became a captain on the Bavarian general staff and saw service in World War I. In 1927 he was given the rank of colonel, and he was made commander of the infantry school at Dresden in 1930. In 1934 Adolf Hitler appointed him commander of the fourth army district of Dresden. After the Austrian anschluss in 1938, he was put in charge of the Austrian army. He was general commanding the armies of occupation of Czechoslovakia in Oct. 1938 and was governor of Moravia in 1939. He played an important part in the conquest of Poland in Sept. 1939 and was made a field marshal by Hitler after the campaign in France, during which he was commander of the 12th army. Known as a brilliant strategist, he won special renown for his direction of troops through mountainous terrains. Marshal von List was in command of German armies on the Moscow front during the Russo-German campaign of 1941. In early battles his forces pressed beyond Moshaisk in the drive on the Soviet capital, but powerful Russian counterdrives compelled him to retreat in the winter of 1941.

Literary Prizes.

The following are the principal literary prizes and awards of the year 1941:

International.—NOBEL PRIZE FOR LITERATURE not awarded since 1939.

United States.—AMES PRIZE (Harvard Law school), to Professor James C. Bonbright of Columbia university and Professor Isaiah L. Sharfman of the University of Michigan for distinguished writing in the legal field. JOHN ANISFIELD AWARD (*Saturday Review of Literature*) to Louis Adamic for his book, *From Many Lands* (Harper), $1,000 for the outstanding book on race relations. ATLANTIC MONTHLY PRESS NON-FICTION PRIZE to Edith M. Almedingen for her autobiography *Tomorrow Will Come* (Little), $3,000 and royalties. ATLANTIC MONTHLY SHORT STORY PRIZE to John D. Weaver for *Clouds of Glory*, $1,000 for the best short story by writers in their 20s. GEORGE LOUIS BEER PRIZE (American Historical association) to Richard H. Heindel for his book, *The American Impact on Great Britain, 1898–1914*, $240. BROSS PRIZE (Lake Forest college, Ill.) to Harris Franklin Rall for his book, *Christianity: An Inquiry into Its Nature and Truth* (Scribner), $15,000. CATHOLIC LITERARY AWARD (Gallery of Living Catholic Authors, Webster Groves, Mo.) to the late Eric Gill for his *Autobiography* (Devin-Adair), an honorary scroll. CHICAGO FOUNDATION FOR LITERATURE to Professor Percy Holmes Boynton of the University of Chicago for distinguished service to literature. COMMONWEALTH CLUB OF CALIFORNIA.—GOLD MEDAL GENERAL LITERATURE PRIZE to Stewart Edward White for his *Wild Geese Calling* (Doubleday); GOLD MEDAL SCHOLARSHIP PRIZE to Carl Thurston for *The Structure of Art* (Univ. of Chicago press); SILVER MEDALS to Kenneth Rexroth for his poetry, *In What Hour* (Macmillan); to Doris Gates for her juvenile, *Blue Willow* (Viking); to Harold Lamb for *The March of the Barbarians* (Doubleday); to William Saroyan for *My Name is Aram* (Harcourt); and to Thomas A. Bailey for *A Diplomatic History of the American People* (Crofts). DODD, MEAD PRIZES.—THE INTER-COLLEGIATE LITERARY FELLOWSHIP to Maureen Daly for *Seventeenth Summer;* RED BADGE DETECTIVE PRIZE to Susannah Shane for *Lady in Lilac* and to Eleanore Kelly Sellars for *Murder à la Mode;* WESTERN STORY NOVEL PRIZE to Peter Dawson for *The Crimson Horseshoe.* FRIENDS OF AMERICAN WRITERS AWARD to Marcus Goodrich for *Delilah* (Farrar), $1,000 to promote high standards and ideals in American writing. GREYSTONE BOOKMAN'S PRIZE to Albert Idell for *Pug* (Greystone). HARPER NOVEL PRIZE to Judith Kelly for *Marriage Is a Private Affair*, $10,000. O. HENRY MEMORIAL AWARD (Doubleday, Doran), $300 to Kay Boyle for her story, *Defeat;* $200 to Eudora Welty for *A Worn Path;* $100 to Hallie Southgate Abbett for *Eighteenth Summer;* $100 to Andy Logan for *The Visit* (first published story). AVERY AND JULE HOPWOOD AWARDS (University of Michigan) to Beatrice Borst for her novel, *Nearer the Earth* (Random). HOUGHTON MIFFLIN LIFE IN AMERICA AWARDS to Agnes Morley Cleaveland for *No Life For a Lady;* and to Donald Culross Peattie for *The Road of a Naturalist.* THOMAS JEFFERSON SOUTHERN AWARDS (Dutton) to Elizabeth Lee Wheaton for *Mr. George's Joint;* a silver medal to Eloise Liddon for *Some Lose Their Way.* ALFRED A. KNOPF LITERARY FELLOWSHIPS, for fiction to Berenice D. Thorpe for *Reunion at Strawberry Hill;* for history to W. E. Binkley for a history of American political parties; for biography to Mitchell V. Charnley for a biography of Thurlow Weed. LATIN AMERICAN PRIZE (Pan American union) to Ciro Alegria for his novel, *Broad and Alien is the World* (Farrar), $2,500. LIMITED EDITIONS CLUB GOLD MEDAL to Ernest Hemingway for his novel, *For Whom the Bell Tolls* (Scribner). NATIONAL BOOK AWARDS (American Booksellers Association), to Richard Llewellyn for the Booksellers' Favourite Novel, *How Green Was My Valley* (Macmillan); to the late Hans Zinsser for the Booksellers' Favourite Non-Fiction, *As I Remember Him* (Little); to Perry Burgess for the Booksellers' Discovery, *Who Walk Alone* (Holt). N.Y. DRAMA CRITICS' AWARD to Lillian Hellman for *Watch On the Rhine* (Random); to Emlyn Williams for the best play from abroad, *The Corn Is Green* (Random). N.Y. UNIVERSITY SOCIETY FOR LIBRARIES GOLD MEDAL to Perry Burgess for *Who Walk Alone* (Holt). PARENTS' MAGAZINE MEDALS to Florence Powdermaker and Louise Ireland Grimes for their *Children In The Family* (Farrar); to Lois Hayden Meek for *Your Child's Development and Guidance, Told in Pictures* (Lippincott). PULITZER PRIZES.—Novel, no award; drama, to Robert E. Sherwood for *There Shall Be No Night* (Scribner); history, to the late Marcus Lee Hansen for *The Atlantic Migration* (Harvard); biography, to Ola Elizabeth Winslow for *Jonathan Edwards* (Macmillan); poetry, to Leonard Bacon for *Sunderland Capture* (Harper). POETRY MAGAZINE six prizes of $100 each: the LEVINSON PRIZE to Archibald MacLeish for *Discovery of Time;* the GUARANTORS' PRIZE to Paul Engle for *America;* the OSCAR BLUMENTHAL PRIZE to Stanley J. Kunitz for *Six Poems;* the JEANNETTE SEWELL DAVIS PRIZE to Karl J. Shapiro for *Four Poems;* the HARRIET MONROE MEMORIAL PRIZE to A. J. M. Smith for *Three Poems;* the HARRIET MONROE LYRIC PRIZE to Frederick Prokosch for *Three Poems.* REYNAL AND HITCHCOCK NON-FICTION PRIZE to W. T. Stace, Stuart Professor of Philosophy at Princeton for *The Destiny of Western Man*, $2,500. MARY ROBERTS RINEHART MYSTERY NOVEL PRIZE to A. R. Hilliard for *Justice Be Damned* (Farrar). *Saturday Review of Literature* AWARD FOR DISTINGUISHED SERVICE TO AMERICAN LETTERS to Ellen Glasgow. CONSTANCE LINDSAY SKINNER MEDAL (Women's National Book association) to Blair Niles "in appreciation of her fine writing, particularly her books on South America." TEXAS INSTITUTE OF LETTERS BOOK AWARD to George Sessions Perry for *Hold Autumn in Your Hand* (Viking). YALE SERIES OF YOUNGER POETS publication won by Jeremy Ingalls for her manuscript, *The Metaphysical Sword* (Yale).

Great Britain.—JAMES TAIT BLACK MEMORIAL PRIZES to Charles Morgan for his novel, *The Voyage* (Macmillan); and to Hilda Prescott for the biography, *Spanish Tudor* (Columbia), £250 and medal to each. HAWTHORNDEN PRIZE £100 to James Pope-Hennessey for *London Fabric* (Scribner).

Children's Books.—THE CALDECOTT MEDAL FOR THE MOST DISTINGUISHED AMERICAN PICTURE BOOK FOR CHILDREN to Robert Lawson for *They Were Strong and Good* (Viking). THE CARNEGIE MEDAL (British) to Kitty Barne for *Visitors from London* (Dodd). JULIA ELLSWORTH FORD FOUNDATION AWARD (Julian Messner, N.Y.) to Babette Deutsch for *Walt Whitman, Builder for America* (Messner), $2,000. HERALD TRIBUNE CHILDREN'S SPRING BOOK CONTEST, $250 each for a book for younger children, to Ann Nolan Clark for *In My Mother's House* (Viking); for a book for older children, to Mildred Mastin Pace for *Clara Barton* (Scribner); for a book for all ages, to Tom Robinson for his dog story, *Pete* (Viking). JOHN NEWBERY MEDAL (American Library association) to Armstrong Sperry for *Call it Courage* (Macmillan).

Foreign Books. *Russian*—STALIN PRIZE to Mikhail Sholokov for *The Silent Don* (Knopf). *Czech.*—CZECHO-SLOVAK STATE PRIZE to Maurice Hindus for *To Sing With the Angels* (Doubleday). (B. GM.)

Lithium Minerals.

In 1940 spodumene was shipped by two producers in South Dakota and one in North Carolina; amblygonite and lepidolite each by one producer in South Dakota; and lithium compounds were recovered as a by-product at the brine operations at Searles lake, Calif. Shipments of the latter decreased, but mine shipments increased, the totals being 1,990 short tons ($97,000) in 1939 and 1,961 tons ($79,679) in 1940. Consumption increased, with a corresponding decrease in stocks.

In South-West Africa the 1940 output included 890 long tons of lepidolite, 252 tons of amblygonite and 40 tons of petalite; exports were 611 tons of lepidolite and 179 tons of amblygonite. No mining was done between June 30, 1940, and March 3, 1941, and the output to the end of the first half of 1941 was 130 tons of amblygonite, of which 50 tons were exported. (G. A. Ro.)

Lithuania.

A Baltic country of northeastern Europe, N. of Poland; at the end of 1941 it was a part of Germany's "Ostland." Area, 22,959 sq.mi. (1940); pop. (Jan. 1, 1940) 2,879,070. (Area and population were slightly increased by boundary adjustments of 1940–41). Chief cities: Vilnius (Vilna, capital, 207,750); Kaunas (actual seat of administration, 152,365). Religion, predominantly Roman Catholic (80·5%). Ruler at the end of 1941 was Commissioner General Adrian von Rintelen, who was made responsible to Reichscommissar Heinrich Lohse of the Ostland.

History.—The kaleidoscopic changes of Lithuanian political history were epitomized in 1941: Under the control of the U.S.S.R. from June 15, 1940, to June 23, 1941, the Lithuanians then staged a revolution and declared independence; the German armies reached Kaunas on June 24, but allowed the independent Lithuanian government to function for about seven weeks; on Aug. 5 this government resigned and the nazi control was complete.

The revolution of June 23 was evidently due not only to the German attack on the U.S.S.R. the preceding day, but also to the deep antagonisms roused in the country by the soviets' mass deportations of national leaders between June 14 and 18. Reports were that as many as 50,000 Lithuanians were killed and 60,000 were shipped to Siberia during the 12 months of Russian occupation, and rumours spread that the intent was to move 50% of the population out of the country. The Russians suppressed the Lithuanian press and religious societies, closed private schools, confiscated the larger farms and factories and removed large numbers of fine-bred cattle. The people were stirred to action, and between June 23 and June 29 they took control of most of the towns from the Russians, who retired before the dual onslaught of Lithuanians and Germans.

To head the new provisional government, Colonel K. Škirpa was elected prime minister. He was the Lithuanian minister to Berlin, and was kept in custody by the nazis, so the post of chief minister was entrusted to Juozas Ambrazevičius, an author and

lecturer in the university of Kaunas. The position of this government was an impossible one after Hitler's proclamation of July 17 setting up the Ostland territory. Herr Lohse's proclamation of July 28, before he left Kaunas for his new seat at Riga, brought matters to a head. Lithuanian appeals of desperation failed, the government resigned on Aug. 5, and after a public ceremony at the Tomb of the Unknown Soldier, Aug. 10, the Germans were left in absolute control.

Outside the country, refugees worked with such groups as the 650,000 Lithuanians in the United States to collect funds and to stimulate opinion in favour of a restored Lithuania after World War II (*q.v.*).

Statistics relating to the economy and social conditions of Lithuania were not issued after the Russian occupation in June 1940; the latest figures available in 1941 pertained to 1939 or earlier years.

Education.—In 1938–39 there were 2,335 private schools with 298,429 scholars, and 83 secondary schools and gymnasia with 19,539 scholars. Part of the university at Kaunas was moved back to Vilna Jan. 15, 1940.

Finance.—The monetary unit is the lita (=16.1 U.S. cents at par, established in 1922 as one-tenth the U.S. gold dollar). In 1939 the budget estimate of the government balanced at 341,785,274 litas. Effects of the German occupation on finance were still uncertain at the end of 1941.

Trade and Communication.—In 1938 imports amounted to 223,686,000 litas, and exports to 233,200,000 litas. Chief articles of import were cotton yarn and thread, woollen yarn and thread, cotton fabrics, woollen fabrics, coal and fertilizers. Chief articles of export were meat, butter, flax fibre, pigs and eggs. Almost 40% of the exports went to Great Britain, 27% to Germany and 5.7% to the U.S.S.R. Imports came 31% from Britain, 24.5% from Germany, 6.7% from the U.S.S.R. and 4.7% from the Netherlands. In 1938 telephones numbered 26,591; radio sets 53,667; broadcasting stations 2.

Agriculture.—Almost 77% of the population is engaged in agriculture, and 49% of the land is arable. Chief products in 1939 and their output in short tons were as follows: rye 726,636; wheat 282,850; barley 282,740; oats 450,841; potatoes 2,290,469; flax fibre 31,416. The 1938 estimate of livestock was: horses 557,540; cattle 1,192,840; sheep 618,980; pigs 1,249,470; poultry 5,130,920. Much of this livestock was reported lost, because of soviet demands, in 1940–41.

Manufacturing.—In 1938 some 1,441 industrial establishments employed 40,818 people. Meat and fish products were valued at 44,919,000 litas; manufactured timber 12,532,000 litas; tissues and yarns 28,131,000 litas; machines, etc. 13,215,000 litas; leather goods 14,374,000 litas. Lithuania lacks mineral resources. (F. D. S.)

Litvinov, Maxim Maximovich (1876–), Russian politician, was born July 17 in Bialystok, Russia. As an agitator and journalist, he devoted himself from youth to revolutionary propaganda. He joined the Social-Democratic party in 1898 and supported Lenin and the bolshevists in the factional clash of 1904. After the revolution (1917) he was the party's plenipotentiary in London, where he was imprisoned as a hostage. He took part in conferences at Genoa and the Hague, led soviet delegations at the 1927, 1928 and 1929 sessions of the preliminary disarmament commissions of the League of Nations and in 1928 signed the Kellogg pact for the U.S.S.R. He was made commissar for foreign affairs in 1930 and championed collective security at League of Nations sessions. He was suddenly dropped from his foreign office post May 3, 1939, in the midst of negotiations with Britain and France for a general mutual assistance pact; the mystery of his ouster was solved in Aug. 1939 when Germany concluded a nonaggression pact with the U.S.S.R. He was expelled from the Communist party Feb. 21, 1941, but returned to favour after the nazis attacked the U.S.S.R., June 22, 1941.

He was appointed soviet ambassador to the U.S. Nov. 6, 1941, and on Dec. 13, 1941, said the U.S.S.R. intended to concentrate on smashing Hitler in Europe and did not immediately envisage opening a second front in the far east.

Liverpool, Arthur William De Brito Savile Foljambe, Earl of (1870–1941), British peer, was born May 27. The earl of Liverpool was fifth holder of the title and second holder since it was revived in 1905 and conferred on his father. He was educated at Eton and the Royal Military college at Sandhurst. He became a second lieutenant in the Rifle Brigade in 1891 and saw service in South Africa, 1901–02. He was governor of New Zealand 1912–1917. He died at his home, Canwick hall, near Lincoln, May 16.

Livestock. The United States livestock industry contributed in record-breaking proportions to the nation's economy in 1941 and at the same time built up flocks and herds to ensure still larger production in 1942. Included in the 1941 output of livestock and livestock production were nearly 19,500,000,000 lb. of meat consumed by the American people. Market prices of $6,305,000,000 received by U.S. farmers (tentative estimate by the U.S. department of agriculture) compared to $4,821,651,000 received by farmers for livestock and livestock products in 1940. Consumption of meat in the United States in 1941 was at an all-time high and was nearly 1,000,000,000 lb. more than in the previous record year of 1940, according to G. A. Schmidt, chairman of the board of the American Meat institute. Per capita consumption of meat in the United States in 1941 was estimated at about 5 lb. more than the per capita consumption of 141 lb. in 1940. A part of the increase was due to augmented buying power from increased employment in industry and transportation and defense activities therein. In addition, the rapidly expanding military forces added materially to meat consumption; U.S. army figures released in 1941 showed that nearly 300 lb. of meat a year was purchased for each soldier. Army per capita consumption of meat was estimated to be more than double that of the per capita consumption of the country as a whole. Production of beef, veal and lamb in 1941 was the largest on record. Pork production was about 5% less than in 1940, but 20% more than the ten-year (1931–40) average. Exports of meat and other livestock products in 1941, chiefly lend-lease shipments to Great Britain, were about three times larger than 1940 exports.

(For lend-lease exports *see* Farm Income; for detailed figures on numbers of livestock and quantities of products *see* Bacon; Butter; Cattle; Cheese; Dairying; Hogs; Horses; Meat; Milk; Poultry; Sheep.)

U.S. Farm Income from Livestock and Livestock Products, 1941 and 1940

	1941	1940
Dairying	$1,860,000,000	$1,526,702,000
Cattle and calves	1,750,000,000	1,380,170,000
Hogs	1,300,000,000	820,802,000
Eggs	610,000,000	449,233,000
Chickens	280,000,000	215,278,000
Sheep and lambs	225,000,000	189,402,000
Wool	143,000,000	110,058,000
Turkeys	82,000,000	76,345,000
Other products	55,000,000	53,667,000

(S.O.R.)

Livestock Shows: *see* Shows.

Llewellyn, Sir William (1863–1941), British portrait painter, was best known for his studies of the late King George V and of Queen Mary. He was president of the Royal academy from 1928 to 1938 and a trustee of the National gallery from 1933 to 1940. Sir William died in London, Jan. 28. (See *Enyclopædia Britannica.*)

Lloyd of Dolobran, George Ambrose Lloyd, 1st Baron (1879–1941), British statesman, was born Sept. 19 at Dolobran, Montgomeryshire, Wales. He was president of the Navy league in 1930 and headed the Seamen's hospitals and the Royal Central Asian society. In 1937 he was named president of the British Council for Cultural Relations with Foreign Countries, an agency for the spread of British "cultural ideas and

ideals" abroad. In 1940 he was appointed secretary of state for colonial affairs in the Churchill ministry; in Jan. 1941 he was appointed leader of the house of lords, but could not assume this post because of illness. A leader of Tory opinion in the house of peers, Baron Lloyd supported the policies of Winston Churchill and frequently criticized the Baldwin and Chamberlain governments, especially with regard to their colonial policy. He strongly disapproved of the proposal to grant India partial self-rule. He denounced the government for concluding a naval pact with Germany in 1935 without consulting France, and he assailed the Munich pact in 1938 as an added "humiliation" to British power.

As president of the British council, he devoted much of his attention to the Balkans and travelled extensively in that region. German newspapers dubbed him the principal British agent in that zone. Among his works are *The Great Opportunity* (1919); *Egypt, Since Cromer*, vol. 1 (1933), vol. 2 (1934); *Leadership in Democracy* (1939) and the *British War Case* (1940), a résumé of British views on war issues. He died in London, Feb. 4. (See *Encyclopædia Britannica.*)

London. In 1941 it was in the first instead of the second half of the year that London was subjected to fierce enemy air attacks. At the end of 1940 (Dec. 29) a deliberate attempt was made to burn the famous square mile known specially as "the city"—an area notable as being devoid of military objectives; large numbers of buildings were wholly or partially destroyed, including the mediaeval Guildhall, eight Wren churches, and many of the halls of the ancient livery companies. After this, compulsory fire watching for all business premises was decreed, and the value of this move was made apparent on Jan. 11, when the enemy made a second attempt with a similar object. Although there were many casualties, especially in two hospitals and a street subway, the incendiary bombs were quickly dealt with and fires were comparatively few. On Jan. 29 and the two following days there were again daylight and night attacks on the London area; early in February the salvage corps was increased from 60 to 600 men. After another lull, in a short but heavy raid on Feb. 17, hundreds of incendiary and many high-explosive bombs were dropped, doing little material damage but causing many casualties.

PRIME MINISTER CHURCHILL inspecting the house of commons after it was gutted by German bombs May 11, 1941

Merseyside, Glasgow, Bristol and other parts of the country then experienced heavy raids, and it was not till March 19 that the *Luftwaffe* returned to London to deliver a large scale attack in which hundreds of houses, shops, and flats, many churches, six hospitals and other public buildings were destroyed or seriously damaged. Another respite, broken only by a few "alerts," followed, till in a widespread series of night raids on April 7 a few bombs fell in the London area, and another hospital was damaged. On April 16 an attack even fiercer and more indiscriminate than those of the previous autumn started at 9 P.M. and continued till 5 in the morning; 500 aircraft were believed to have flown over in continuous waves, and the damage was more widespread than on any previous occasion. Six enemy bombers were brought down—one in Kensington high street. The German claim that 100,000 incendiaries as well as vast quantities of high explosives were dropped was probably not exaggerated. Again material losses were heavy, while among the many people killed were Lord and Lady Stamp and their eldest son, and the earl of Kimberley, formerly known on both sides of the Atlantic as Lord Wodehouse, the international polo player. St. Paul's cathedral suffered severely; the City Temple, St. Andrew's Holborn, and Chelsea old church were among the churches destroyed. Maples' store and Christie's famous auction rooms were among the business premises burnt out. Three nights later (April 19–20) London was again subjected to a seven-hour raid; but, though loss of life was considerable, especially among the firemen and A.R.P. workers, mastery of the fire bomb was becoming more assured.

Londoners then enjoyed three weeks of uneasy peace till on May 10–11—a night of full moon—the *Luftwaffe* made a surprise effort. In a raid during which London seemed ablaze from the docks to Westminster, much damage was done, and casualties were high. The house of commons, Westminster abbey and the roof of Westminster hall were severely damaged, the Temple was almost devastated and the British museum also suffered damage. But victory remained with the defense workers and firefighters of London, and 33 of the destroyers' planes were destroyed.

Daylight raids over London had already ceased before the end of April, and from May 10 there was a long lull. Except that on July 27–28 a small number of bombers—four of which were brought down—did slight damage in residential areas and caused some civilian casualties, no bomb was dropped or siren heard in London up to mid-October. Full advantage was taken of the respite, especially by the fire-fighting, civil defense and demolition authorities; restaurants, places of amusement and night clubs began to function again, and the promenade concerts at the Albert hall had a record season.

By the end of the second year of war the changes in London were very marked. Large, irregular, and for weeks untidy, open spaces had taken the place of crowded dwellings and prosperous business and shopping thoroughfares; huge watertanks and shelters—surface and underground—were everywhere; 80 of the tube stations, with their tiers of bunks, canteens, first-aid posts and aproned welfare workers had become glorified doss-houses. In the streets well-known statues had been "evacuated"; "British restaurants," communal kitchens, and mobile canteens were to be seen; many railings disappeared, and uniforms of every kind, including those of the Allied and overseas forces, were more and more noticeable. An important, but not at first sight obvious, change was the passing, under the fire services (emergency provisions) act, 1941, of the London fire brigade from the control of the London county council to that of the home office. Another matter for remark was the speed with which local authorities, bombed hospitals and the public at large accommodated themselves to the new conditions. By the end of June, 43 hospitals had been severely damaged in the metropolitan area, and 30 less seriously. The ratio of destruction of property and of casualties in London, said Henry Willink, the special commissioner for the civil defense region, in June, was eight times as great as in the rest of the country. But in spite of complex problems the rehousing, reclothing and general "reconditioning" of those rendered homeless was dealt with by London's 95 local authorities more speedily and more successfully after the tragic experiences of April and May than after any of the earlier raids.

It is impossible to name more than a few of the damaged areas and treasures lost in addition to those already mentioned. The many churches and places of worship destroyed or very badly damaged included: St. Mary-le-Bow (of "Bow Bells" fame), St. Bride's, Fleet street ("the journalists' cathedral"), All Hallows, Barking (the Toc H church), Christ church, Newgate street (Wren; famed for its Spital sermon and its connection with the Bluecoat school), St. Mildred's, Bread street (with its Australian memorial), St. Albans, Wood street (Wren), and St. James's Garlickhithe (Wren)—all in the city; also St. Clement Danes (of the "oranges and lemons" rhyme), in the Strand; the Temple church (largely 12th century), St. Alban's, Holborn, St. John the Evangelist, Waterloo road, St. Mary's, Newington, St. Columba's, Pont street, St. George's cathedral (R.C.), Southwark, Spurgeon's tabernacle, the Salvation army headquarters, and the central synagogue in Great Portland street. Non-ecclesiastical memorials demolished included: the Tudor building of the Charterhouse and the house in Charterhouse square that was Catherine Parr's home before she became a queen of Henry VIII; many of the mediaeval portions of Westminster school, also the deanery, and the 17th century Greycoat hospital, a Westminster charity foundation; the Temple, Lincoln's Inn, and Gray's Inn; Dr. Johnson's house off Fleet street, and Neville's court nearby, which had remained almost unchanged since its rebuilding after the great fire of 1666.

Among official and other public buildings: the Law courts, the central criminal court ("the Old Bailey"), the Bankruptcy court, the London sessions house and the Clerkenwell county court; the Guildhall, the county hall and Westminster city hall, the National Central library and the School of Tropical Medicine in Bloomsbury, and the Florence Nightingale International Federation centre in Manchester square; the Royal Empire society,

the Royal Society of Arts, the Royal Academy of Dramatic Art, and the headquarters of the Independent Labour party, most of them with their large specialized libraries; Broadcasting House, the Queen's hall, with its valuable collection of hundreds of musical instruments, St. George's hall, with the B.B.C. organ; the music museum in Bloomsbury and some galleries of the natural history museum and the science museum in South Kensington.

In March G. G. Ammon, a well-known Labour M.P. and former organizing secretary of a trade union and parliamentary secretary to the admiralty in the two Labour administrations, succeeded A. E. Davies as chairman of the London county council; C. W. Gibson was elected vice-chairman, and Charles Latham continued in office as leader.

The annual estimates were up by £5,750,000 to £51,276,714, but of this amount nearly £26,950,000 was covered by receipts in aid and exchequer grants and more than £2,750,000 by balances, leaving £21,570,000 (a reduction of some £2,000,000) to come from the rates, which were reduced by 6*d.* to 7*s.*0½*d.*, adequate provision having been made for the maintenance of all the social services. Of the total, civil defense took £16,947,000 (an increase of nearly £7,940,000 over the previous estimate), of which all but £1,160,255 would be met by exchequer grants and other income. Apart from this the principal items included for emergency purposes were: £5,567,700 for debris disposal, £1,650,000 for rest centres, and £50,000 for meal service. At the end of June, when it was reported that the council had already voted and spent £750,000 for the repair of war damage and £1,500,000 on urgent miscellaneous necessities, it had to ask for a further £100,000 in respect of war damage repair, £250,000 to meet similar items and capital expenditure, and £1,000,000 for urgent miscellaneous matters. Total capital expenditure for 1941–42 was estimated at £3,756,000 (a decrease of more than £4,000,000), with another £1,000,000 as reserve. The council's gross debt was £138,078,000, and the net outstanding loan about £89,416,000.

There was an increase from 7% to 8½% in the Londoner's water-rate—the concern of the Metropolitan Water board, not the county council. This represented on a £50 house an extra 15*s.*2*d.* annually, and was accounted for by the large increases in rates and taxes payable by the board, by the price of coal and particularly by additional expenditure due to A.R.P. and the reduction of population through evacuation. (L. H. D.)

London University. Few important changes could be recorded in 1941. The university remained dispersed but much continued to be done in London, especially in science, technology and oriental studies. Bombing in London and elsewhere caused considerable damage to university property, both buildings and libraries. The number of students in engineering increased by about 10% and in science by 5%, but the demands of the armed forces caused a heavy drop in non-scientific faculties, particularly economics. More teachers proceeded to other forms of national service. No new chairs were created but some vacancies were filled, so that essential work did not suffer unduly and research by no means ceased. The standard of work was generally better than in the pre-war years. Colleges played a full part in the various government schemes for training specialists. Military or royal air force training was made compulsory for all men students of military age not specially exempted. The principal, H. L. Eason, retired and H. Claughton was appointed acting principal. (S. J. W.)

"Lone Ranger": *see* GRASER, EARLE W.

Los Angeles. Fifth largest city of the U.S.A., Los Angeles, Calif., had a population of 1,504,277 by the federal census of 1940, and an estimated population of 1,625,000 in 1941. The aircraft industry boom brought thousands weekly to Los Angeles in 1941. Five major firms—Douglas, Lockheed-Vega, North American, Northrup, Vultee—with lesser plants totalled an investment of $80,000,000 in 1941 and had 150,000 employees and a $21,000,000 monthly payroll. One-half the country's aircraft production was located in this vicinity in 1941. A new municipal airport, under construction during the year, represents a total investment of $7,500,000. Mayor (Jan. 1, 1942): Fletcher Bowron.

The dedication of Crowley lake, 300 mi. distant, on Oct. 19, 1941, added enough water for domestic needs for an entire year. Colorado river water flowed into the city reservoir June 20, marking the completion of a $220,000,000 project. Contracts put into effect the Boulder Canyon Project Adjustment act and stimulated a greater expansion of basic industries. The unprecedented demand for cheap housing brought about extensive projects, and new impetus was given to metropolitan planning. Defense plans were greatly accelerated by the war against Japan. Many Japanese nationals in Los Angeles were arrested by F.B.I. agents after the outbreak of war, and air-raid precautions were redoubled.

Bank clearings approximated $13,000,000 in 1941, a 17½% gain over 1940. Building permits showed a corresponding gain, but stock exchange sales showed a sharp decline. (R. D. Hu.)

Loudon, Hugo (1860?–1941), Netherlands oil and rubber executive, was born in The Hague. He went to school in Delft, where he received a degree in civil engineering in 1885. He served as head administrator of the Royal Dutch company, 1894–1902, and as manager, 1902–21. In 1921 he was made a member of the company's board of directors and in 1929 he became president of the board. Loudon also had wide interests in tobacco and rubber companies in the Dutch colonies. He died in the Netherlands, Sept. 6, according to a dispatch from Willemstad, Curaçao.

Louisiana. One of the west south central states of the United States of America, admitted to the union in 1812 as the 18th state, Louisiana is popularly known as the "Pelican state," "Creole state" or "Bayou state." Total area 48,523 sq.mi., of which 45,177 sq.mi. are land; population (1940) 2,363,880, of which 1,383,441 or 58·5% were rural and 980,439 or 41·5% urban; 64% native whites, 34·3% Negroes and 1·7% foreign born. Capital, Baton Rouge, 34,719. Other important cities are: New Orleans, 494,537; Shreveport, 98,167; Monroe, 28,309; Alexandria, 27,066; Lake Charles, 21,207; Lafayette, 19,210; Bogalusa, 14,604; New Iberia, 13,747; Gretna, 10,879.

History.—No session of the legislature and no important elections were held in 1941. The chief political movements were the attacks by the ousted Long faction upon the constitutionality of much of the reform legislation enacted in 1940, and attempts to halt the investigation of political scandals. The state supreme court upheld some of the reform measures and invalidated others; and numerous court actions were pending at the end of the year.

The national defense program accounted for much of the construction work in the state in 1941. Existing army training camps were enlarged, several new ones were constructed, and new airfields were established. Industrial plants engaged in defense production were expanded, and additional ones were built. Access roads were built in the vicinities of the new army camps, and housing facilities were greatly expanded near the camps, airfields and defense industries. From August to October 500,000 soldiers participated in elaborate military manoeuvres in Louisiana. Work was begun on an oil pipe line from Baton Rouge to the Atlantic seaboard, as a phase of the defense program.

State officers in 1941 were Sam Houston Jones, governor; Mark M. Mouton, lieutenant governor; James A. Gremillion, secretary of state; A. P. Tugwell, treasurer; L. B. Baynard, auditor; Eugene Stanley, attorney general.

Education.—Education is free and compulsory for all children. Separate schools are maintained for whites and Negroes. The public elementary schools enrolled 212,000 white and 158,000 Negro pupils in 1941: public high schools had 83,000 white and 15,000 Negro students; 10,750 white and 4,150 Negro teachers were employed in the public schools. Emphasis is placed upon vocational training, and the state maintains nine public trade schools. The state expenditure for elementary and secondary education exceeds $28,000,000 annually. Numerous private and parochial schools enrol 50,000 elementary and 10,000 high school pupils.

Louisiana state university at Baton Rouge, with 654 teachers and 8,426 students in 1941, heads the public school system for whites; Southern university at Scotlandville, with 54 teachers and 881 students, heads the public school system for Negroes. Louisiana state normal college at Natchitoches, Louisiana Polytechnic institute at Ruston, Southwestern Louisiana institute at Lafayette and Southeastern Louisiana college at Hammond are state-supported colleges and teacher-training schools for whites, with a total of 400 teachers and 7,000 students. Tulane university (endowed) and Loyola university (Roman Catholic) at New Orleans,

Centenary college (Methodist) at Shreveport and Louisiana college (Baptist) at Pineville, with a total of 800 teachers and 7,500 students, are other important colleges for whites. Dillard university (endowed) and Xavier university (Roman Catholic) at New Orleans, and Leland college (Baptist) at Baker, with a total of 75 teachers and 1,000 students, are important nonstate colleges for Negroes. Annual state expenditure for higher education is about $9,400,000.

Public Welfare, Charities, Correction.—In 1940, 5,398 CCC enrollees received $358,000; 7,874 received $191,000 in NYA assistance; 24,783 received $1,274,000 on WPA, and 6,464 received $646,000 on other federal works projects; 31,882 received $379,000 in old-age assistance; 13,081 families and 36,575 children received $310,000 in mothers' and children's aid; 1,067 received $16,000 in blind pensions; 9,677 received $141,000 in general relief; 528 received $12,000 from the FSA; 133,000 received $5,940,000 in unemployment insurance.

The state maintains the following: charity hospitals at New Orleans, Shreveport, Lafayette, Pineville, Independence and Monroe; insane hospitals at Jackson and Pineville; a tuberculosis sanitarium at Greenwell Springs; schools for the blind and deaf at Baton Rouge; training school for feeble minded at Alexandria; soldiers' home at New Orleans.

There are also numerous private and endowed hospitals and orphanages. The state maintains two prison farms for its 3,300 adult offenders and separate training institutes for 200 male and female juvenile delinquents.

Annual state appropriations for public welfare, charities and correction exceed $21,000,000.

Communication.—There were, in 1941, 18,000 mi. of state highways, 4,000 mi. of which were paved and 10,000 gravelled; about $25,000,000 is expended annually on state highways. The state had 4,500 mi. of railways and 4,800 mi. of navigable waterways in 1941. New Orleans, Baton Rouge and Lake Charles are ports for ocean-going commerce, with tonnages in 1940 shown in Table I.

Table I.—*Tonnage of Ocean-going Commerce for Louisiana Ports, 1940*

Ports	Tonnage, foreign	Tonnage, coastwise
New Orleans	5,780,000	5,700,000
Baton Rouge	1,257,000	3,505,000
Lake Charles	479,000	2,282,000

There were 24 airports for land planes and one base and eight anchorages for sea planes in 1941. Barksdale field near Shreveport is a leading U.S. army air base.

Air-mail and passenger lines connect New Orleans and other Louisiana cities with all parts of the country.

There are 175,000 telephones in the state.

Banking and Finance.—Louisiana had 29 national banks in 1940, with assets of $415,739,000, deposits of $382,191,000, and capital, surplus and reserves of $30,521,000; and 117 state banks, with assets of $143,361,000, deposits of $122,609,000, and capital, surplus and reserves of $20,579,000. There were 74 savings and loan associations, with total assets of $90,074,000. Postal savings totalled $9,000,000. The state budget for the fiscal year 1940–41 was $117,414,000, with receipts and expenditures balanced. Gross state debt, $130,000,000; net debt, $126,000,000.

Agriculture.—The total value of agricultural production in 1941 was $80,000,000; total acreage harvested, 4,155,000. Cash income from crops and livestock, $103,000,000; from government payments, $17,000,000. Weather conditions during 1941 were generally favourable for agriculture.

Table II.—*Leading Agricultural Products of Louisiana, 1940 and 1939*

Crop	1940	1939
Cotton, bales	455,000	745,000
Corn, bu.	24,128,000	23,325,000
Rice, bu.	18,040,000	20,597,000
Oats, bu.	1,984,000	1,664,000
Sugar cane, tons	3,335,000	5,060,000
Hay, tons	458,000	431,000
Sweet potatoes, bu.	4,988,000	6,935,000
Irish potatoes, bu.	2,280,000	2,106,000
Soybeans, bu.	234,000	243,000
Peanuts, lb.	16,740,000	18,800,000

Manufacturing.—About 1,900 industrial establishments, employing nearly 100,000 workers and paying $100,000,000 in wages, produced finished products worth more than $600,000,000 during 1941. In 1939, products were valued at $565,265,273; in 1937, $580,839,828. Statistics of the U.S. biennial census of manufactures for 1939 (preliminary) and for 1937 are given in Table III.

Table III.—*Principal Industries of Louisiana, 1939 and 1937*

Industry	Value of Products	
	1939	1937
Petroleum refining	$109,627,341	$122,151,945
Cane-sugar refining	66,673,546	74,463,193
Lumber and timber products	43,940,491	44,496,047
Paper	25,650,456	28,558,171
Rice cleaning and polishing	17,296,826	17,808,261
Pulp	13,816,560	13,747,984
Bread and bakery products	14,517,493	13,884,963
Bags, other than paper	10,741,090	13,386,384
Cottonseed products	7,823,552	12,702,413
Chemicals	32,506,506	11,097,316
Malt liquors	10,662,514	6,664,155
Nonalcoholic beverages	11,013,503	9,015,060
Printing and publishing	12,176,042	12,239,638
Paper bags and cardboard boxes	10,281,718	14,211,433

Mineral Production.—Total value of mineral production in Louisiana for 1941 was about $200,000,000. New petroleum deposits were developed during the year, principally in the southern part of the state.

Table IV.—*Principal Mineral Products of Louisiana, 1940 and 1939*

Mineral	Value, 1940	Value, 1939
Petroleum	$103,961,000	$ 95,746,380
Natural gas	71,928,000	65,350,140
Natural gasoline	3,857,000	3,329,000
Sulphur	8,206,960	6,761,000
Salt	2,804,406	2,830,331
Totals for years	$190,757,366	$174,016,851

(W. PR.)

Lo Wen-kan (1888–1941), Chinese statesman, was born in Pangyu in Kwangtung province, China. He received his M.A. degree at Oxford and studied law in London. He was minister of justice in 1921, 1926 and 1932–34, and was president of the Peking supreme court and finance minister in 1922. He was also foreign minister in 1928, and from 1932 to 1933. Lo vainly appealed to the League of Nations to halt Japanese aggression in China, but later declared that China could not depend upon outside help and had to rely upon her own resources. He died in northern Kwangtung province, Oct. 16.

Lozovsky, Solomon Abramovich (PSEUDONYM OF A. S. DRIDSO.) (1878–), Russian politician. He became an active revolutionary in 1900, organized Social-Democratic party clubs among railroad workers, and was arrested. He escaped, however, and lived abroad until the outbreak of the revolution. In 1917 he returned to the U.S.S.R. and devoted his energies to the organization of the Russian and the international trade union movements. In June 1939, Lozovsky was appointed vice-commissar for foreign affairs, and in June 1941, at the outbreak of the Russo-German war, he became assistant director of the Soviet Information bureau. Lozovsky frequently regaled foreign newspaper correspondents in Moscow with acid comment on Hitler's victory claims. He derided nazi claims of gains and casualties, described the German blitzkrieg as a "washout" and said Hitler would only capture Moscow "when he can see the backs of his ears."

Lumber. The U.S. lumber industry was in 1941 called upon to supply a large share of the construction requirements of the defense program. The industry satisfactorily met the demands for both defense and civilian requirements. Some mills over-sold their production and refused new business.

Lumber production during July 1941 was at the highest level since 1929. The demand for lumber was not expected to decrease. Its use for the construction of troop barracks, airports, shipbuilding and other army and navy requirements as well as for munition boxes and packages, factories and other requirements incident to the defense program was likely to continue. Industrial and private dwelling construction was likely to decrease because of governmental restrictions.

Ceiling prices were established for many of the sizes and grades principally in demand. Some exceptions were made to provide for extraordinary circumstances. The U.S. government requested the West Coast Lumbermen's association in July to increase its production. This increase in August, over July, amounted to 18%. The normally active intercoastal lumber trade continued to be very quiet due to lack of available ship space; the increase of lumber shipments by rail from the Pacific Northwest was proportionately large.

The price of wholesale construction lumber, using the 1926 figure as 100, averaged 122.3 during July, the highest monthly average of any month since 1923. The peak prices of all time for lumber were reached in 1920, and were far above 1941 levels.

War conditions continued to prevent free movement of lumber to other countries. A strong demand existed but it was difficult to do business because of lack of available shipping facilities. Exports of lumber definitely decreased, but imports increased because of the availability of ship bottoms bringing in return cargoes.

Lumber production during 1941 was estimated at 31,500,000,000 bd.ft., which was about 4,500,000,000 above production in 1940. The production of western pine, including ponderosa, sugar and Idaho pines, was estimated at 6,000,000,000 bd.ft.; Douglas fir, western hemlock and associated species 8,500,000,000 bd.ft. and southern pine at 9,000,000,000 bd.ft.

Attractive prices brought many small mills into production, particularly in the southern pine and hardwood regions, the northeast and the lake states. Although the production of the individual small mill may be only from 500,000 to 3,000,000 bd.ft. each year, the total increased production from these small mills may result in billions of total production and probably equal to about 40% of the total national production. It is estimated that approximately 3,000 additional small sawmills came into production during 1941.

As the national economy became further disturbed by defense measures and war priorities, the lumber industry was in a position to supply many materials to replace metals vitally needed for defense industries. Timber connector construction, for example, was being widely used for huge military warehouses and storehouses as well as for aeroplane hangars, bridges and many other structural forms. About 7,000,000,000 bd.ft. of lumber were used for the defense program of 1941. This included purchases by the war and navy departments as well as contractors and industries engaged in the defense program. (N. C. B.)

British Empire.—Great Britain, cut off from all European sources of supply after May 1940, when the last of the Scandinavian shipments were made, continued throughout 1941 to rely upon imports from Canada, from the United States and from the British Colonies, and upon the ever-expanding output of the home woods. Such are the curious twists in wartime, however, that toward the end of the year some wood from an unexpected quarter became available for Britain. In October a convoy which took British war material to the soviet union returned to Britain with cargo mainly of timber.

British timber stocks, carefully conserved from the outbreak of war and utilized only under licence, were adequate for essential needs. Purchases by the government timber controller from Canada slackened in the early part of the year, but Canadian producers and shippers found a ready compensating balance in the great demand for timber in the dominion itself for hangars and buildings in connection with the empire air training scheme, and for war industries' developments on the grand scale, and in the increased call for timber in the United States. Canada supplied great quantities of Sitka spruce and yellow birch for use in aircraft, and aircraft veneer production in the dominion made astonishing progress. In the latter half of the year the British timber controller was again active in buying in Canada.

Government timber control became operative in Britain as soon as war was declared. Canada, too, set up a timber control department, and similar steps were taken in Australia and New Zealand. The control was designed in each case to regulate the trade in the national interest. Price control figured in the plan, the aim being to prevent inflation and speculation.

Home timber production in Britain was calculated to show a sevenfold increase in 1941 over pre-war output. To the normal civilian labour employed in the woodlands were added the activities of the Canadian Forestry corps, and forestry companies from New Zealand and Australia, all the personnel being drawn from skilled woodmen and mill-men in the dominions and all militarily trained. In addition there were fellers from Newfoundland and another large body from British Honduras; while sections of the Women's Land army were also devoting themselves to forestry work. The Canadian, New Zealand and Australian forestry units constructed their own mills, and their output—big and constantly growing, as more production facilities were provided—were making notable contributions to Britain's timber needs.

Distribution in Britain (from stocks well dispersed for safety) was maintained through the usual trade channels, and by a system of "pools" all engaged in the trade had a share in the remuneration provided by the government for the wharfing and distribution work. (*See* also FORESTS.) (N. F.)

Lutherans. The year 1941 intensified and extended problems for the Lutheran church throughout the world, perhaps in greater degree than for any other church. This was true because its membership was so extensively involved by citizenship in countries at war, and because the church in Scandinavian and in other European countries, besides Germany, was cut off from their large missions in foreign lands. At the same time conditions in the orient made the mission work of the Lutheran church in America increasingly difficult, with added responsibility for the care of missions previously supported by the church in Europe.

Through special appeals, Lutherans in America contributed approximately $600,000, in the latter part of 1940 and the first half of 1941, for the care of distressed missions abroad and for church ministry to soldiers and sailors called to the service of their country. At the same time contributions for the support of the regular program of the church grew, and the membership was substantially increased.

The general statistics for 1940, released about the middle of 1941, for the U.S.A. and Canada (European and mission statistics not available), show a total of 13,399 ordained ministers, 18,921 congregations, 5,347,783 baptized members and 3,685,625 confirmed members.

During 1941 extensive plans were developed for celebrations of two historic anniversaries in 1942. One of these is the celebration of the 200th anniversary of the landing of Henry Melchior Muhlenberg in America. Muhlenberg is regarded as the "organizer" of the Lutheran church in America, though he arrived 100 years after the first Lutheran settlements were made. The second celebration is that of the 100th anniversary of the arrival of Carl Frederick Heyer in India, as the first foreign missionary sent out by the Lutherans from America.

Large sums of money were contributed by Lutherans in America, in 1941, for their colleges and theological seminaries. Debts were paid or reduced, new buildings were erected and endowments were increased. (W. H. G.)

Luxembourg. Lying between France, Germany and Belgium, Luxembourg was first created a state by the treaty of London, April 19, 1839. Its ruler after World War I was the Grand Duchess Charlotte. Area, 999 sq.mi.; pop. (1937), 300,732; chief town, Luxembourg (cap., 59,760); language, Luxembourgian (idiomatic) and (officially) French and German; religion, mainly Roman Catholic.

On May 10, 1940, the grand duchess was forced to flee as German troops swept into the country and placed it under military administration. On Aug. 14, 1940, military administration was replaced by an even more oppressive civil rule under Dr. Gustav Simon, German gauleiter of the Treves-Cologne district. German laws, language and taxation were introduced. Use of the terms "grand duchy" and "state of Luxembourg" was forbidden, and Luxembourg was virtually incorporated into the German reich. Its economic resources were systematically exploited for Germany's benefit.

But the population remained stubbornly hostile to the new rulers and continued to be loyal Luxembourgers, true to their democratic traditions and the words of their national song, "We want to remain what we are." (S. B. F.)

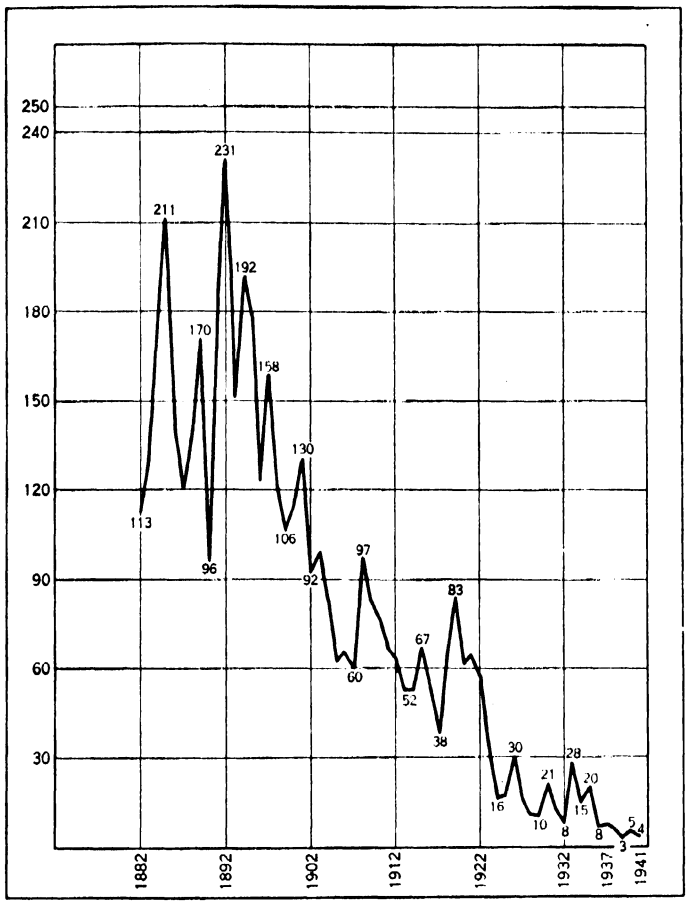
Lynchings. Renewed hope for the elimination of lynching from the American scene was found in the fact that during 1941 this type of crime claimed but four victims, according to the department of records and research of Tuskegee institute. Contrasted with an annual average of 78 victims for the 60 years just ended, the figure for 1941 showed a decrease of 95%; with the high record of 231 victims in 1892, a decrease of 98%. After 1931 the average was ten lynchings per year; after 1936, five per year. The cases reported as lynchings in 1941 were as follows:

Andrews, S.C., Feb. 15: A Negro sawmill worker was killed by head wounds inflicted in a fight between him and a fellow worker and five white youths. The latter were incensed, it is said, because white men had been discharged from the mill and Negroes employed in their places. On order of the coroner's jury the five white men were arrested and tried. Two were convicted of manslaughter and sentenced to seven years' imprisonment; three were acquitted.

Blakely, Ga., May 6: A Negro garage helper, suspected of theft, was taken out of town and beaten into unconsciousness by three white fellow employees. He died six days later. His assailants had not been arrested nor indicted at the end of 1941.

Quincy, Fla., May 13: A Negro youth, charged with assaulting a white girl, was taken from jail by a mob, shot repeatedly and left for dead. Finding him alive a few hours later, the sheriff put him in an ambulance and started him to a hospital. Several men stopped the conveyance, pulled the Negro out and shot him to death. No arrests were made.

Gastonia, N.C., April 13: Four white men, drunk, shouted insults at a Negro man and his wife on the highway. A rock battle ensued, and the white men chased the couple home, where the man's mother fired at them. After dark the four returned. The Negro came out of the house holding a gun and was shot to death. The four assailants were arrested within 24 hours, tried and convicted within ten days and sent to prison for terms of 14 to 25 years.



LYNCHINGS in the U.S. from 1882 to 1941 based on figures given by the department of records and research, Tuskegee institute

There are some who hold that two of these incidents, those in the Carolinas, should be classed as homicides resulting from private brawls, rather than as lynchings. Tuskegee, however, gives them the latter classification under an agreement by interested organizations, which defines lynching as "death illegally at the hands of a group acting under the pretext of service to justice, race or tradition."

Since the tabulating of lynchings was begun in 1882 the record shows a total of 4,699 victims, 83 of them women, 1,300 of them white. Three-fourths of the victims were charged with homicides or lesser offences. Less than one-fourth were accused of assaults on women. Careful investigations have shown that many of the victims were innocent. The southern states lead in the number of lynchings, nine of them with records above 200 victims each. Several states outside the south have had from 40 to 80 lynchings each.

Principal agencies campaigning against lynching are the National Association for the Advancement of Coloured People and the Commission on Interracial Co-operation with its affiliate, the Association of Southern Women for the Prevention of Lynching, which has a signed membership of 43,000 southern white women. (*See* also NEGROES [AMERICAN].)

(R. B. E.)

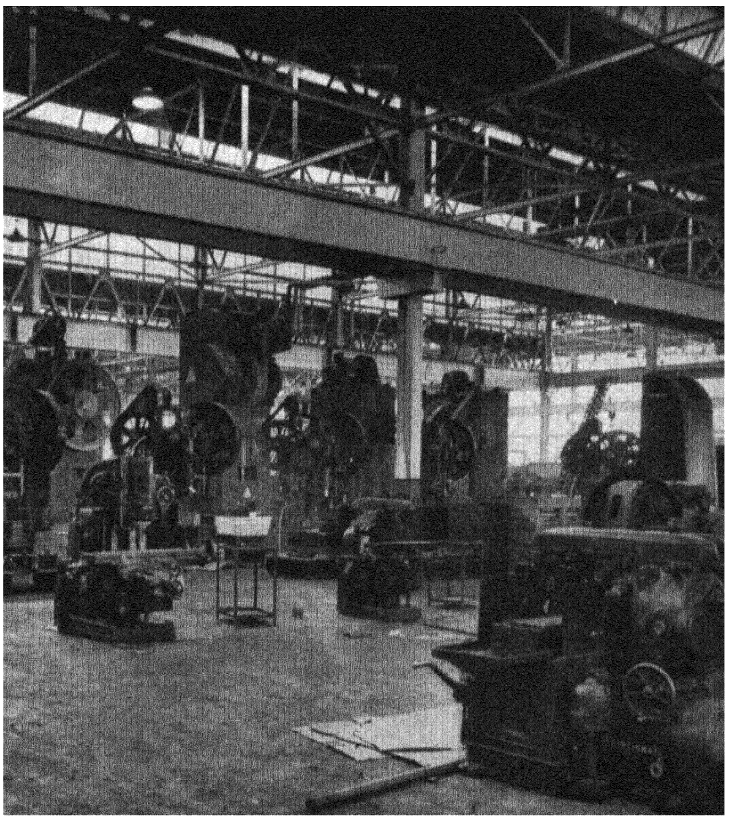
McAdoo, William Gibbs (1863–1941), U.S. lawyer and politician, was born Oct. 31 near Marietta, Ga. From 1939 until the time of his death he was chairman of the board of the American President lines, a government-owned shipping business. He was the author of *Challenge; Liquor and Lawlessness versus Constitutional Government* (1928), and an autobiography *Crowded Years* (1931). McAdoo died in Washington, D.C., Feb. 1. For his earlier career see *Encyclopædia Britannica.*

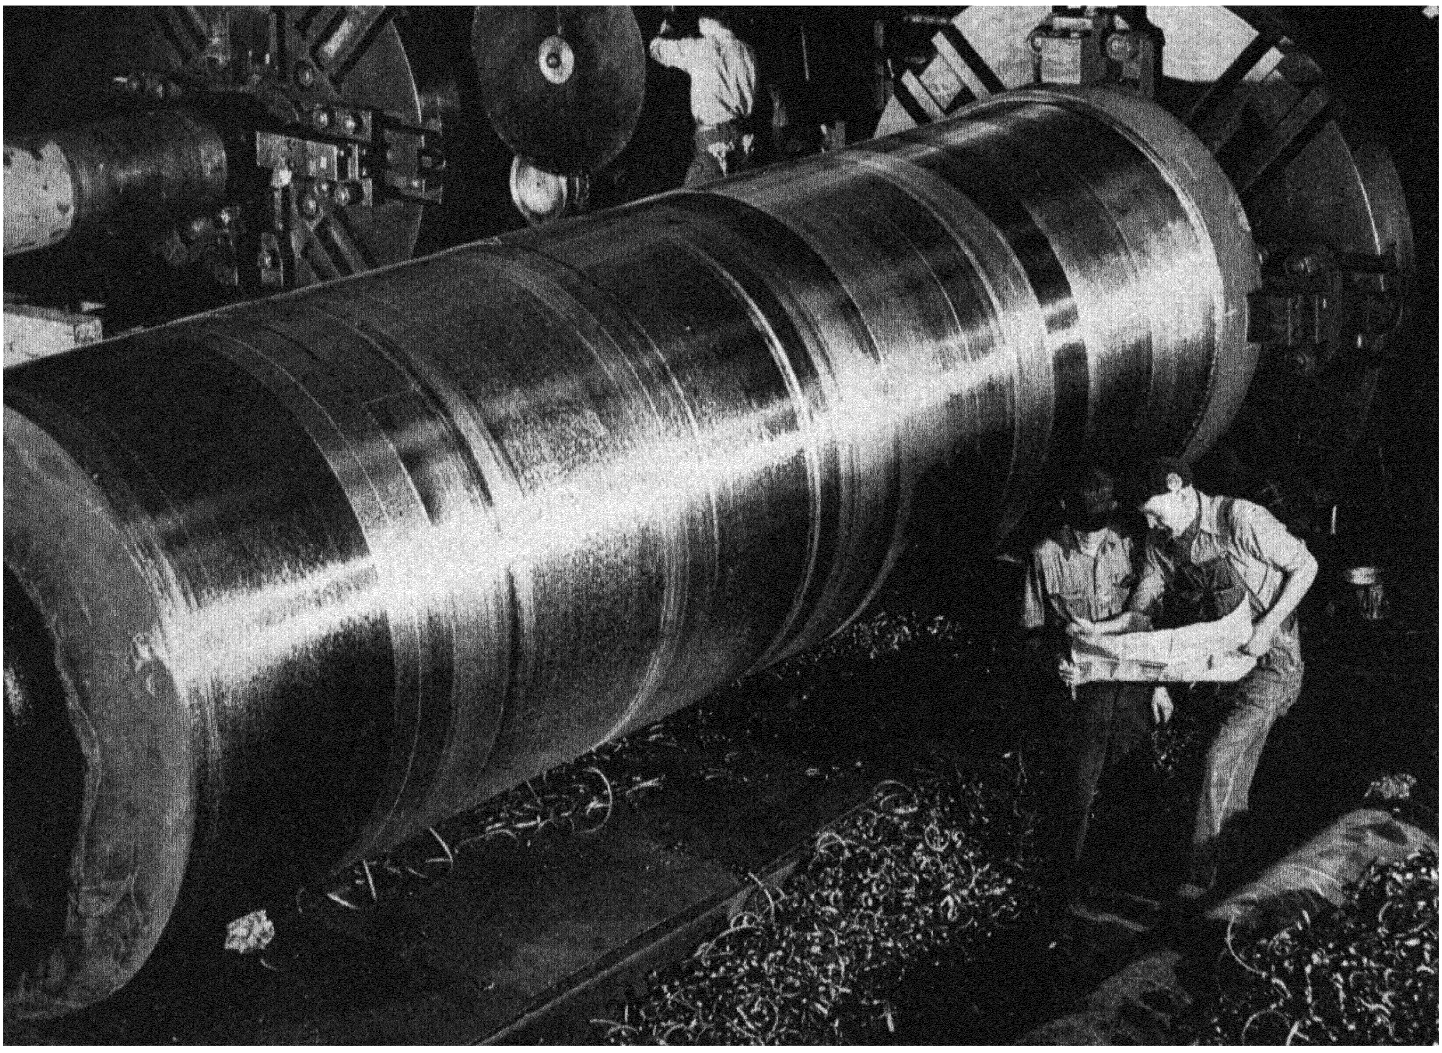
MacArthur, Douglas (1880–), U.S. army officer, was born Jan. 26 in Little Rock barracks, Ark., the son of Lt. Gen. Arthur MacArthur. Graduated as number one man of his class from West Point in 1903, he was commissioned in the engineer corps. He rose from major to brigadier general in World War I. He led the 84th infantry brigade in the St. Mihiel salient, Sept. 1918, and was subsequently made division commander. He was gassed and wounded in action. When made a major general in Jan. 1925, he was youngest of that rank in the U.S. army. He commanded the department of the Philippines, 1928–30. Made chief of staff with rank of full general by President Hoover on Nov. 21, 1930, he reorganized the nation's defenses, enlarged the air corps, doubled the enlisted personnel and initiated mechanization. President Roosevelt retained MacArthur as chief of staff beyond his regular term so that he could complete army reorganization. In Oct. 1935, at the request of President Manuel Quezon of the Philippines, he relinquished his post as chief of staff, became military adviser to the Philippine government and overhauled the commonwealth's defense system. On June 19, 1936, he was appointed field marshal of the Philippine army. He retired Dec. 31, 1937, but Quezon kept him on as head of all Filipino military and constabulary forces. Roosevelt formally nominated MacArthur to be a lieutenant general in command of U.S. and commonwealth forces in the Philippines, after the Philippine army was reincorporated into U.S. forces July 26, 1941. Following Japan's attack on the Philippines he was renamed a full general by President Roosevelt Dec. 19, 1941, and led Filipino and American forces in the defense of the islands.

McCormick, Harold Fowler (1872–1941), U.S. industrialist, was born May 2 in Chicago, the son of Cyrus Hall McCormick, inventor of the reaping machine. After graduation from Princeton in 1895 he went to work in the International Harvester company. In 1918 he became president of the company and in 1935 he was named chairman of the board. McCormick was a member of the board of the Chicago Civic Opera company and from 1934 until his death was honorary chairman of the Chicago Grand Opera company. He endowed the McCormick Institute for Infectious Disease and was a trustee of the University of Chicago and the McCormick Theological seminary. He died in Beverly Hills, Calif., Oct. 16.

Machinery and Machine Tools. Rapidly expanding requirements for production equipment to manufacture ordnance material during 1941 threw a tremendous load on the machine-tool industry. In normal

MACHINE TOOLS in the Chrysler tank arsenal at Detroit, Mich. were in place by April 1941, only seven months after ground was broken for the plant





HUGE LATHE machining the outer breech tube of a 16-in. gun in the ordnance shop of a U.S. steel works

times this industry is surprisingly small; it numbers about 250 companies employing in the neighbourhood of 50,000 men. In the worst depression year orders for machine tools fell off to only about $22,000,000. By 1939, however, Great Britain and France were purchasing large numbers of machine tools, and production for that year reached $200,000,000. The crisis of 1940 initiated a period of growth in the industry which had not reached its peak at the close of 1941. Production of machine tools rose to the unprecedented height of nearly $450,000,000 during 1940, and during 1941, production increased further to an estimated $750,000,000.

Output in 1941 was about 34 times that at the bottom of the depression, and was 7½ times the industry's normal volume. It was 2½ times the volume attained during 1918, when the industrial effort in World War I was at its peak. By the end of 1941 its monthly output was at a rate close to $850,000,000 a year. It was probable that in 1942 the machine-tool builders of America would turn out machines valued at $1,000,000,000 or more.

The industry expanded its output both by adding to its production facilities and by using those facilities more hours each day. New plants were erected, plants were expanded by putting up building extensions, new machine tools were installed and placed in operation within the industry, and many additional men were hired and trained. Practically every company in the industry took on "green" help and trained them as semiskilled operators. Also, the number of hours worked each week was increased. Some plants were working 20 to 24 hours a day with two or three shifts.

Most machine-tool companies also expanded their output by farming out work extensively. Where they had normally built all parts in their own plants, they were in 1941 supplementing their own efforts with the production of plants in other industries. In addition, the machine-tool producers surveyed their plants to discover and put into effect every possible means of increasing production with available facilities. Concentration of production on fewer sizes and types of machines was one of the means employed. The fewer sizes made, the nearer a plant could approach a maximum output. Other factors contributed to larger production: these included better use of floor space, better balancing of production schedules, the use of jigs and fixtures for parts previously made one at a time and improved methods of handling parts and materials through the shop.

Production of machine tools during 1941 naturally was concentrated for the most part on standard sizes and types of machines for which there was the most demand. Nevertheless, a number of new and improved machines were brought out to meet specific needs of the defense industries. In addition, builders of special machine tools found an increasing demand for their product coming from the rapidly expanding aircraft, aircraft engine and similar industries. In the past these industries had been working on a job-lot basis, and could not justify the high-production, single-purpose equipment which in 1941 was such an important factor in increasing production rates in the mass-production industries.

Transfer Machine.—An outstanding example of this type of equipment installed during 1941 was the two-section automatic transfer machine purchased by a new aircraft engine plant for drilling, countersinking, reaming and tapping aluminum cylinder heads. This 80-ft. long machine replaced 40 ordinary machine tools, and yet required only 24 semiskilled operators per three-shift day as compared with 105 highly skilled men needed on the 40 machines replaced. The first unit had 16 stations and performed 25 separate machining operations with 64 tools. The second unit had 53 stations, and 46 operations were performed with 70 tools. A finished cylinder head was turned out every two minutes, as contrasted with the 35 minutes required by ordinary methods.

Broaching, Drilling and Reaming Machines.—Of special importance in the manufacture of ordnance was the development during 1941 of machines and tools for broaching the rifling in gun barrels. Two companies, each working independently, made this equipment available. In one case, 20-mm. Oerlikon cannon could be broached in about 10 min. with solid helical broaches. Four operations, each using a separate broach, were necessary. Each broach had nine splines, six of the spaces between the splines being used as a body to guide the broach, while every third space had an oil channel which served as a passage for lubricating oil which was supplied under pressure.

In addition, a number of deep-hole drilling and reaming machines were made available to speed up production of gun barrels. One interesting machine announced early in 1941 was arranged to do all operations necessary to perform the complete precision chambering of gun barrels to receive the cartridge. In this machine the butt end of a previously drilled, reamed and rifled gun barrel was held at one end of the work spindle by a lever-operated collet chuck. Its outer end was supported in an adjustable lathe-type steadyrest with spring-operated jaws. The turret of the machine contained ten tool spindles, each fitted with a tool adapter, adjustable lengthwise, which acted as a depth stop as the tool was fed into the barrel. After the work spindle had been started, all succeeding operations were controlled by a capstan wheel. As the operator turned the handwheel at the start of the operation, the uppermost spindle, which was in line with the work spindle, fed forward and the first chambering operation was performed. Upon withdrawal of this spindle, the turret indexed to bring the next spindle into line and the second operation was performed. The ten tools working successively completed the chamber.

The drilling and reaming of rifle and machine gun barrels received particular attention during 1941. One six-spindle vertical drilling machine handled either cal. .30 or cal. .50 barrels. Each of the six spindles was provided with individual hydraulic actuation, and each had an automatically actuated three-jaw self-centring chuck for holding the barrel. The revolving barrels were fed down over stationary single-lip drills. For convenience in tool changing, the tool holder was mounted on a slide to accommodate different lengths of drills. Another vertical-spindle machine was arranged for push and pull reaming of the same rifle barrels. On this machine, spindles were grouped in units of four, with each unit independent of the others in action and control. Thus, on the 12-spindle machine three sets of four barrels of different lengths could be reamed at different speeds. Reamers were attached to the spindles either by rigid connections or by quick-acting chucks. Coolant was pumped to the centre of each hollow reamer shank to flush the reamers continually.

Thread Grinding.—Important developments continued to be made in the field of thread grinding. Two companies in 1941 offered fully automatic machines for grinding internal threads, in addition to their standard lines of external thread grinders. One company made internal thread grinders in three models, in all of which the grinding wheel spindle automatically was withdrawn from the grinding position to the wheel-dressing position for automatic dressing of the wheel, and the wheel spindle then was returned to the working position. The amount dressed off the wheel was compensated for automatically. With the machine in gauging position, a safety device locked the grinding wheel spindle to prevent accident to the operator while gauging or changing the work.

Heavy Duty Machine Tools.—Large, heavy duty machine tools were in considerable demand for the manufacture of naval vessels, tanks, heavy gun mounts and similar defense items. In this field a large horizontal boring, drilling and milling machine, announced during the latter part of the year, was of interest. Combination hydraulic-electric control permitted high standards of accuracy, operating convenience and maximum flexibility in application on this machine. The main spindle might be either six or seven in. in diameter, while a smaller 2¼ in. diameter auxiliary spindle was provided for high-speed cutting with small tools. The standard table on this machine measured 60 x 104 in. with 84-in. cross travel. Two oversize models also were available. The same company developed a large planer-type boring, drilling and milling machine with four heads, two on the crossrail and one on each of the side housings. Each headstock could be swivelled 30 deg. in either direction from its normal centre, and each had a 4½-in. diameter spindle in an 11½ in. diameter quill. Power for each spindle was supplied by individual 10-h.p. adjustable speed motors. Interlocking controls permitted starting of the headstock and table drive motors only when the table oil pump and headstock feed motors were running. An overload on any motor would cause automatic shut-down of the machine.

Large marine turbine reduction gears needed to drive naval vessels and auxiliary craft on the ways brought a demand for larger and more accurate hobbing machines. One of the leading suppliers of this type of equipment built several machines having a nominal capacity for gears 120 in. in diameter, with 48 in. face width at 45 deg. and 2½ diametral pitch. With lower helix angles, these machines would accommodate gears up to 160 in. in diameter. Each weighed approximately 138,000 lb. and required a 20 x 30 ft. floor space. Two opposite cutter heads permitted both right- and left-hand portions of double-helical gears to be cut simultaneously, resulting in a substantial increase in production. At any time either head might be disconnected, and the machine operated as a conventional single-head machine. Driving motors and main gear mechanism were placed away from the machine proper to provide thermal isolation. For the same reason, all drive shafts were journalled outside the machine. Tapered roller bearings 54 in. in diameter took the radial table thrust, while flat annular bearings carried the vertical load. Maximum table runout is 0.0003 in. Eleven motors were required to operate the machine.

Gear Shaver.—Shaving continued to increase in importance as a method for finishing gear teeth accurately. One company developed a crossed-axis gear shaver for finishing internal gears to supplement its line of rotary gear finishers for spur and helical gears. This machine finished internal gears through a combination of work rotation, cutter reciprocation and vertical work feed. In contrast to external gear finishers, the machine provided for mounting the cutter on the machine head, while the work was located in a special driving fixture on the knee. This arrangement permitted lateral reciprocation of the cutter through the head drive, while the work was rotated and fed into the cutter. The same company made available a line of gear-finishing machines for crossed-axis shaving gears up to four ft. in diameter and 20-in. face width. Another supplier of similar equipment announced a gear-shaving machine which finishes gears up to 36 in. in diameter, 2 in. pitch, with face widths up to 36 in.

Turning Machine.—One of the few entirely new machines announced during 1941 was the "Rigid-turner" vertical turning machine for high-production turning of multiple-diameter work having straight, tapered or formed sections. Single and eight-spindle machines incorporating this principle were being built for purposes such as turning diameters and tapers on cluster-gear shafts, turning the spherical end on variable-ratio universal joints, and turning the complete contours of shell. Main advantage of the machine was that inexperienced help could be used to operate it. The principle of turning might be described as a disk-type form cutter rolling along the work piece, which was rotated and fed vertically past the tool. Accurate layout of the cam and cutter permitted accurate starting of the cut, cutting of straight and tapered sections of exact length, generation of square-cut shoulders and chamfering. For shell turning, the rotary machine with a different type of head and a carbide tool was used. This head was operated from a cam which had the shape of the shell to be turned. The single tool turned the length of the shell, keeping the number of adjustments to a minimum. On 75-mm. shell, these machines averaged 185 pieces per hour over an eight-hour day.

Shell Machines.—Large requirements for shell-turning equipment brought about the development of a number of special automatic shell machines, in addition to the arrangement of a number of standard multiple-tool lathes for shell operations. During the year, the defense committee of the National Machine Tool Builders association, at the suggestion of army ordnance officers, developed a line of special machines for making shell. Designs of these machines were such that they could be built quickly in any well-equipped machine shop.

Also, a manufacturer of welding machines took over the manufacture of a British-developed shell-turning lathe of somewhat unusual type. Many new features were embodied in the design of this lathe. The tool boxes were supported from an overhead bridge to permit chips to fall clear. A conveyor loaded and unloaded the shell without being lifted by the operator. Production on this machine for large shell was high, as from 18 to 20 British 5½-in. shell, 27 in. long, could be rough turned per hour by unskilled operators. (B. C. B.)

Mackenzie King, William Lyon: *see* KING, WILLIAM LYON MACKENZIE.

McLean, Edward Beale (1883–1941), U.S. publisher, was born in Washington, D.C. Heir to an immense fortune, he was educated by private tutors. Young McLean made news in 1911 when he bought the famous Hope diamond for his wife at a cost of $300,000. In 1916 he again made news with his efforts to break his father's will and gain direct control of the McLean estate, then estimated at $25,000,000. McLean, who controlled the *Washington Post* and the *Cincinnati Enquirer*, became a power in the inner councils of the Republican party and was a close friend of President Harding and his secretary of interior, Albert B. Fall. Called to testify before the senate committee investigating the Teapot Dome scandal, McLean revealed that in 1921 he had made a loan—without security—of $100,000 to Fall. In 1933 McLean was declared legally insane and incapable of managing his estate. He died in Baltimore, Md., July 27.

McNamara, James B. (1881?–1941), U.S. labour agent, was sentenced to life imprisonment in 1911 for bombing the *Los Angeles Times* building in which 21 persons were killed. Defended by the late Clarence Darrow and supported in his protests of innocence by leading liberals, McNamara at first maintained that he was being "persecuted" to discredit the labour movement. He later confessed, however, declaring his motive for placing a time-bomb in the building was to demonstrate against what he regarded as the paper's "unfair" labour policies. Public reaction to the bombing was so strong that the *Times* won its campaign against closed shops. He died in prison in San Quentin, Calif., March 8.

McNaughton, Andrew George Latta (1887–), Canadian army officer, was born at Moosomin (Sask.) Feb. 25, the son of Robert Duncan and Christina Mary Anne (Armour); he was educated at Moosomin public school, Bishop's college school, Lennoxville, P.Q., and at McGill university (1906–10), B.Sc., 1910, M.Sc.

1912, Senior demonstrator in electrical engineering (1912–14). General McNaughton served conspicuously in World War I, during which he commanded in succession the 4th battery, 2nd brigade, Canadian field artillery; the 21st howitzer battery; the 11th brigade C.F.A.; and next was appointed counter-battery staff officer of the Canadian corps. Wounded at the second battle of Ypres (April 1915) and again at Soissons (Feb. 1918), he was three times mentioned in dispatches, awarded the Distinguished Service Order (1917) and made a Companion of the Order of St. Michael and St. George (1919).

Upon returning to Canada in May 1919, General McNaughton was appointed member of the committee for the reorganization of military forces of Canada, and in 1922 he was promoted to deputy chief of the Canadian general staff. In 1929 General McNaughton was again promoted, this time to chief of the general staff, a position which he held until asked to be president of the Canadian National Research council (1935).

He served in this capacity until Oct. 6, 1939, when he was appointed commander of the Canadian active service forces. As head of the National Research council, in addition to contributing numerous papers to technical journals, he particularly directed research in electrical and aeronautical investigations, and was joint inventor with W. A. Steel of the cathode-ray direction finder. At the close of the year (1941) General McNaughton was "somewhere in England" with the First Canadian Army corps.

Magnesite. The known prewar output of magnesite was about 1,350,000 metric tons, excluding Russian production, on which there was no accurate information. Of this total the axis powers had within their own original borders only about 5%, but controlled by forcible annexation and occupation at least 86% of the total; of the remainder 3% was in British territory and 13% in the United States.

To offset the shortage due to the inability to import Austrian magnesite, the United States production had been heavily increased, amounting to 333,166 short tons in 1940, as compared with 187,660 tons in 1929 and 316,838 tons for the former wartime peak in 1917. Of the 1940 output of crude, 2,133 tons was sold as crude, 16,261 tons as caustic calcined and 140,668 tons as dead-burned.

Imports in 1940 were 30,951 tons, most of which was from the Japanese area of Kwantung. No serious difficulty was anticipated in maintaining the necessary supplies to meet current needs in the United States, but no information was available as to conditions in other countries. (G. A. Ro.)

Magnesium. There has been an enormous expansion in the demand for magnesium for light alloys and for incendiary bombs. The 1940 output of metal increased by 87% over 1939, to 6,261 short tons. This was all by one producer, but others entered the field in 1941, and what the total for 1941 might be was largely dependent on when the plants were put into operation, and the output that could be worked up in the remainder of the year.

From such data as were available in 1941 it seemed fairly certain that a doubling of the 1940 total could be made, and that a trebling might not be impossible.

Still further additions to output were under way, and by early in 1942 the production rate was expected to be at least six times that of 1940, and the 1941 output should not be much if any less than the world total for 1940.

An unofficial estimate of production in 1940 included 19,000 metric tons from Germany, 6,500 tons from Great Britain, 5,680 tons from the United States, 4,000 tons from Japan, 2,000 tons from France, 1,500 tons from U.S.S.R., 700 tons from Switzerland, and 500 tons from Italy, a total of 39,900 tons, with nearly every country on the list planning for increased output. (*See* also METALLURGY.) (G. A. Ro.)

Mahmud, Mohammed Pasha (1882–1941), Egyptian politician, was born in Upper Egypt. A graduate of Oxford, he entered the Egyptian government service, soon won the rank of pasha and the post of deputy governor, and became a leader of the nationalist movement. In 1919 he was exiled to Malta for his anti-British activities, but was given permission to go to Paris where he appealed to Woodrow Wilson to help Egypt win her freedom. After failing to sway the U.S. president he went to the United States to enlist sympathy for the nationalist cause, but was again unsuccessful. On his return to Egypt he helped organize the Liberal Constitution party and became its leader and president. He became premier in 1928 and dropped his extremist views. When King Farouk called on him in Dec. 1937 to form a cabinet, it was for the purpose of disbanding the Blueshirts, a nationalist party made up of Egyptian youth. Mahmud Pasha resigned in 1939 because of ill health, but was called back in the war days of 1940 to the post of defense minister. He died in Cairo, Feb. 1.

Mail-Order Business: *see* BUSINESS REVIEW: *Retail and Wholesale Trade.*

Maine. The extreme northeastern state of the United States, admitted as a state in 1820 and popularly known as the "Pine Tree state." Area 33,215 sq.mi.; pop. (1940) 847,226. Rural dwellers numbered 504,169, while 343,057 were classed as urban. The capital is Augusta (19,360). The largest cities are Portland (73,643); Lewiston (38,598); Bangor (29,822).

History.—The state legislature met in Jan. 1941 for its regular biennial session and adjourned in April. The house had 151 members, the senate, 33. Among controversial measures enacted were a premarital examination law, a contributory pension bill covering state employees, and a cigarette tax bill the returns of which were earmarked for old-age assistance. Various tax rates were increased, including a half-cent-a-gallon rise on gasoline. The gas-tax increase was defeated in a referendum election, and the governor vetoed the pension bill because the legislature failed to enact tax measures to finance the state pension fund. The governor and his finance officers made changes in budgeting, accounting, and auditing procedures of the state, designed to improve efficiency and prevent financial scandals such as had occurred during the preceding administration. The permanent investigating committee established by an act of the 1940 special session published its first report on administrative conditions in the state government. The governor charged the liquor commission with inefficient and lax administration of the laws, and replaced all three members, with his former secretary as chairman. Many state employees resigned during the year to accept better-paid positions in war industries or other private employment. Governor Sewall of Bath was expected to be a candidate for renomination in the June (1942) primaries for the 1943–44 term. Senator Brewster took office in January for his six-year term.

Education.—Colby college carried on construction of several buildings on its new campus on "Mayflower Hill." The University of Maine started a library building. Maine's three colleges and the state university considered an accelerated (three-year) program as a war move, but no definite plans were made. There were 1,989 students enrolled at the University of Maine in Sept. 1941, and the teaching staff numbered 181.

Finance.—The state budget for 1939–40 through 1941–42 was as fol-

lows: actual, 1939–40: receipts $43,822,761; expenditures $43,462,343; estimated, 1940–41: receipts $41,243,284; expenditures $41,208,277; estimated, 1941–42: receipts $41,343,796; expenditures $41,342,496. The gross debt on May 31, 1941 was $28,205,500.

Agriculture.—One of the driest seasons in history in the southern and central portions of Maine affected hay, apples and other crops. Wells and springs went dry, forcing farmers to haul water for livestock, and at the end of the year streams and lakes were still below normal levels. Maine's potato crop for 1941 was estimated at 44,745,000 bu. as compared with 41,762,000 bu. for 1940. The average Maine price per bushel for the 1940 crop was 34 cents; reports through December showed a 64-cent average for the 1941 crop.

Table I.—*Leading Agricultural Products of Maine, 1941 and 1940*

Crop	1941 (estimate)	1940
Corn, bu.	697,000	663,000
Wheat, bu.	36,000	42,000
Oats, bu.	3,996,000	4,160,000
Barley, bu.	135,000	116,000
Buckwheat, bu.	105,000	91,000
Hay, tons	650,000	770,000
Potatoes, bu.	44,745,000	41,762,000
Apples, bu.	787,000	752,000
Beans, tons (dry)	5,150	3,850

Manufacturing. The total value of manufactures (1939 census) was $345,368,595. Total employment was 81,995, and wages paid, $82,026,503.

Table II.—*Principal Industries of Maine, 1939 and 1937*

Industry	Value of Products	
	1939	1937
Boot and shoe	$46,162,403	$42,568,005
Cotton mill	28,342,860	28,037,430
Woollen mill	36,118,681	28,109,949
Pulp and paper	25,370,932	28,890,516

During 1941 there was an exodus of skilled and semiskilled labour from the rural areas to shipyards and industries of Maine, and from Maine in general to industrial centres in other states. Maine shipbuilding revived and spread along the coast; paper, cloth, and shoe mills were on full-time schedules of defense work. The composite business index for the state rose to 21.3% higher in Nov. 1941 than in Nov. 1940. The 1941 tourist business was estimated at $108,000,000, $10,000,000 more than the 1940 figure.

Mineral Production.—The total value of minerals produced in Maine in 1939 was $3,769,671, as compared with $3,548,638 in 1938.

Table III.—*Principal Mineral Products of Maine, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Stone	$1,228,930	$1,161,535
Sand and gravel	888,646	968,766
Clay	371,629	210,814

Mallory, Clifford D. (1881–1941), U.S. shipping executive, was born May 26 in Brooklyn, N.Y. At 19 he became a clerk in the Mallory shipping firm, which his great-grandfather founded with a fleet of clipper ships. Except for a two-year interval, 1917–19, when he served as assistant director of operations of the U.S. shipping board, he remained with the firm continuously. In 1919 he was named president of C. D. Mallory & Co., and later headed several other shipping companies. Mallory died in Miami Beach, Fla., April 7.

Mallory, Frank Burr (1862–1941), U.S. pathologist, was born Nov. 12 in Cleveland, O. After receiving his M.D. from Harvard medical school in 1890, he studied pathology at Prague and Freiburg, Germany. In 1903 Dr. Mallory isolated the scarlet fever bacillus and a year later he published his discovery of "protozoonlike" bodies in the epidermal cells. He discovered the cause of cirrhosis of the liver and also developed new methods for treatment of whooping-cough. He was connected with the Institute of Pathology at the Boston City hospital from 1891 to 1932. Dr. Mallory was an organizer of the American Association for Cancer Research and in 1935 was awarded a medal by the Association of American Physicians for outstanding work in pathology. He was co-author of *Pathological Technique* (1897) and wrote *The Principles of Pathologic Histology* (1914). Dr. Mallory died in Brookline, Mass., Sept. 27.

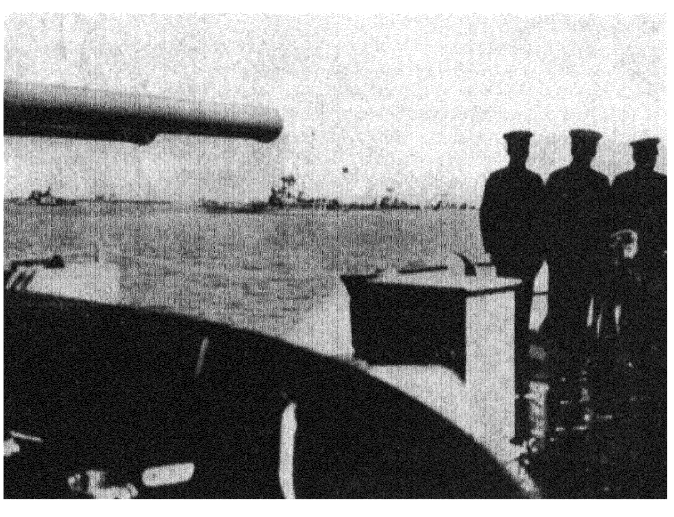
Malta: *see* BRITISH POSSESSIONS IN THE MEDITERRANEAN.

Manchoukuo (MANCHURIA). An empire, practically a dependent state of Japan, located in northeastern Asia, bounded on the north and east by Soviet Siberia, on the west by Siberia, Outer Mongolia and China proper, on the southeast by Chosen. Its main outlet to the outside world is through the Kwantung leased territory, with its large port of Dairen, which is directly administered by Japan. The capital is Hsinking (formerly Changchun); the emperor is Kangte. Area, approx. 548,000 sq.mi.; pop. (1939), 39,454,000, including 642,300 Japanese and 1,162,100 Chosenese. The largest cities are Mukden (863,515), Harbin (517,127), Hsinking (415,264), Antung (220,587).

History.—Manchoukuo was formerly divided into the three northeastern provinces of China, Fengtien, Kirin and Heilungkiang. It was not closely integrated with the Chinese state and its rulers, Chang Tso-lin (1916–1928) and his son, Chang Hsueh-liang (1928–1931), administered it as a virtually independent principality, with little reference to the Chinese central government. Both the U.S.S.R. and Japan possessed extensive administrative and preferential commercial rights in Manchuria in connection with their operation of the region's most important railways, the Russian-owned Chinese Eastern railway and the Japanese-owned South Manchuria railway. Russian rights lapsed during the years of revolution and civil war; but a new agreement for joint Soviet-Chinese operation of the Chinese Eastern railway was negotiated in 1924 and remained in effect until the soviet government sold its interest in the railway to Manchoukuo in 1935.

Disputes over various political and economic questions preceded the action of the Japanese army in seizing Mukden, seat of Chang Hsueh-liang's administration, on Sept. 18, 1931, and then extending its occupation to the whole country. A committee of Manchurians who were willing to accept Japanese domination proclaimed the independent state of Manchoukuo Feb. 18, 1932. Henry Pu Yi, a scion of the old Chinese Manchu dynasty, was inaugurated as chief executive of the new state on March 9; he was proclaimed emperor, assuming the name of Kangte, on March 1, 1934.

There are no representative institutions in Manchoukuo, and there is a firm Japanese control of the governing bureaucracy,



JAPANESE-MANCHOUKUOAN GUNBOATS maintained a vigilant patrol of the Amur river, along the Russian border, after Germany invaded the U.S.S.R. in 1941

largely achieved through the powerful general affairs bureau. While the ministers are usually natives of Manchoukuo, real authority rests with Japanese vice-ministers. The commander in chief of the Kwantung army, the Japanese force in occupation of the country, is also the ambassador of Japan to Manchoukuo; this army plays an important part in shaping the development of the country. For some years Japan and the Central American republic of El Salvador were the only foreign powers which recognized Manchoukuo diplomatically. As Japan became more closely associated with the Berlin-Rome axis, Germany, Italy and the countries which were associated with them politically extended recognition to Manchoukuo, and Manchoukuo associated itself with the anti-Comintern pact and followed Japan's lead in declaring war on the United States and Great Britain in Dec. 1941.

Education and Religion.—Manchoukuo in 1939 possessed 15,877 primary schools, with 1,589,169 students. There were 238 middle schools, with 54,768 students, 40 normal schools, with about 8,000 students, and 13 institutions for higher education, with 3,820 students. Manchoukuo's expenditure on education in the fiscal year 1939 was 45,967,000 yuan. The principal religions, in the order of numbers of adherents, are Buddhism, Taoism, Lamaism, Mohammedanism and Christianity. There are about 130,000 Roman Catholics and 125,000 followers of other branches of the Christian faith in Manchoukuo.

Defense.—The Manchoukuoan army was originally recruited on a volunteer basis, with a strength estimated at 80,000 to 100,000. In numbers, and still more in equipment and political reliability, it was inferior to the Japanese Kwantung army. An imperial ordinance of April 15, 1940, established conscription and a three-year term of compulsory military service. There were ten army headquarters in 1941, located in the principal cities of the country, with a river defense headquarters in Harbin, to take charge of the flotilla of gunboats and patrol vessels on the Amur and Sungari rivers. Between 1934 and 1939 five military schools were established, two in Hsinking, one in Mukden, one in Harbin and one in Wangyehmiao, in the Hsingan province.

Finance and Banking.—The Manchoukuoan yuan is equivalent in value to the Japanese yen, which was pegged at 23.48 cents. The budget for the fiscal year 1940 (which coincides with the calendar year) was 573,550,000 yuan, as against 403,377,000 yuan in 1939. The two most important banks in 1941 were the Central bank of Manchou, which controls the note issue, and the Industrial bank of Manchou.

Trade and Communication.—Like Japan, Manchoukuo ceased publishing statistics of foreign trade in the autumn of 1940. For the first nine months of 1940, exports were 544,629,000 yuan; imports were 1,397,715,000 yuan. These figures showed a continuance of the trend of the preceding years, when a series of heavy unfavourable trade balances indicated a pouring of Japanese resources into Manchoukuo for purposes of industrial and military development. Manchoukuo had 11,067,900 km. of railway lines in Oct. 1939. About 8,000 mi. of national highways were constructed at a cost of 50,636,766 yuan between 1932 and 1938.

Agriculture, Resources, Manufactures.—Manchoukuo's staple crop is the soybean, which is used for a great variety of food and industrial purposes. The annual production of this grain has been steady at about 4,000,000 tons. Manchoukuo's other principal crops in 1939 were kaoliang (4,570,000 tons), millet (3,530,000 tons), corn (2,470,000 tons), wheat (940,000 tons), rice (700,000 tons). The output of rice increased considerably because of the inflow of Chosenese farmers who are skilled in the use of irrigation. Manchoukuo has large forest areas in its northern provinces and considerable reserves of coal and iron, although the last is of low quality.

Mandated Pacific Islands: *see* PACIFIC ISLANDS, MANDATED.

Mandates. Owing to the war it was not found possible for the Mandates commission to meet in 1941. But the

Mandated Territories

Territory	Area	Date of Mandate	Mandatory Power	Former Title	Former Administration
South-west Africa, including Caprivi Zipfel, formerly part of Bechuanaland protectorate	317,725 sq.mi.	Dec. 17, 1920	Union of South Africa	German South-west Africa	German Empire
Togo, comprising: (1) Togoland, i.e. western section, excluding the seaboard	13,040 sq.mi.	July 20, 1922	Great Britain	Togo	German Empire
(2) Togo, i.e. eastern section and seaboard	20,000 sq.mi.		France		
Cameroons, comprising: (1) Cameroons adjoining Nigeria	34,081 sq.mi.	July 20, 1922	Great Britain	Kamerun	German Empire
(2) Cameroons adjoining French Equatorial Africa	161,200 sq.mi.		France		
Tanganyika	360,000 sq.mi.	July 20, 1922	Great Britain	German East Africa	German Empire
Ruanda-Urundi	21,200 sq.mi.		Belgium		
Palestine	10,100 sq.mi.	Sept. 29, 1923	Great Britain	Palestine	Ottoman Empire
Trans-Jordan	34,000 sq.mi.		Great Britain	Part of the Wilayat of Syria	
Syria and Lebanon	77,700 sq.mi.		France	Syria	
New Guinea, Territory of, comprising: (1) North-eastern New Guinea (i.e. the northern section of south-east New Guinea) (2) Bismarck Archipelago (New Britain, New Ireland, the Admiralty Isles, etc.) (3) Certain of the Solomon Islands (Bougainville, Buka, etc.)	93,000 sq.mi.	Dec. 17, 1920	Commonwealth of Australia	Kaiser Wilhelm's Land Bismarck Archipelago German Solomon Islands	German Empire
Western Samoa, comprising Savaii, Upolu, etc.	1,133 sq.mi.	Dec. 17, 1920	New Zealand	German Samoan Islands	German Empire
Nauru	8 sq.mi.	Dec. 17, 1920	British Empire, as represented by Great Britain, Australia, and New Zealand	Nauru	German Empire
Pacific Islands North of the Equator, comprising: (1) Marianne or Ladrone Islands (except Guam) (2) Caroline Islands, comprising the Eastern Carolines and Western Carolines, together with Yap Island and Pelew (3) Marshall Islands	811 sq.mi.	Dec. 17, 1920	Japan	No change	German Empire

mandates section of the secretariat at Geneva still received and distributed the annual reports of the mandatory powers to the members of the Mandates commission. It continued the classification and study of other documentary material concerning mandated territories. There was no question but that the exceptionally full documentary evidence at the disposal of the League secretariat, bearing on every aspect of the mandates system as well as upon many general colonial problems, would be found of the utmost value at the close of the war, when statesmen would be called upon to provide just and satisfactory solutions of these far-reaching, controversial questions. (M. FE.)

Manganese. Such limited information as had become available on world manganese production is condensed into the accompanying table.

World Production of Manganese Ore
(In thousands of metric tons)

	1929	1937	1938	1939	1940
Brazil	316	253	222	193	119
Cuba	1	131	124	102	120
Egypt	191	186	153	120	?
Gold Coast	415	536	329	342	?
India	1,010	1,068	983	950?	?
South Africa	9	631	552	420	412
U.S.S.R.	1,415	2,752	2,273	?	?
Others	482	483	472	450?	?
Totals	3,840	6,040	5,100	4,700?	?

Production of high grade manganese ores in the United States in 1940 was only 40,123 long tons. By midyear of 1941 new plant construction for increasing the output was being put into operation, and by November production had increased to 12,700 tons monthly, which is still a comparatively low figure considering the magnitude to which domestic production was pushed during World War I.

Total shipments for 1941 would not be much if any more than 75,000 tons.

Imports into the United States had been heavy, amounting to 1,294,278 long tons in 1940 (general imports), and at a rate during the first three quarters of 1941 equivalent to 1,135,000 tons for the year. Trade statistics indicated that receipts from Brazil, India, South Africa and various minor sources had been at a rate in excess of that needed for immediate consumption, and that surplus had been accumulating in bonded warehouses.

Receipts from the Gold Coast fell below consumption demands during 1940, and had practically disappeared since early in 1941; it was understood that most of the Gold Coast ore was sent to England after the Mediterranean had been closed to traffic from India. This also stopped shipment of Russian ore, of which no shipments had been received after about midyear of 1940, and it was believed that by the end of 1941 practically all of the stock in bond had been used.

The action of Japan in forcing the United States into the war in the Pacific area was expected to have considerable effect on the manganese supply.

In the first place, imports from the Philippines, which amounted to 45,000 tons in the first three quarters of 1941, were not expected to be possible, and smaller amounts from the Netherlands East Indies would also be cut off. Furthermore, any appreciable extension of Japanese naval activities was likely to have an adverse effect on Indian shipments.

Little was known of operations in 1941. Shipments from Cuba and Brazil increased, while production in South Africa in the first half of the year was 245,019 short tons, an increase of 16% over the same period of 1940, but exports declined to 151,423 tons. (*See* also METALLURGY.) (G. A. RO.)

Manitoba. A midcontinent province of Canada, the oldest and most easterly prairie province. Area, 246,512 sq.mi. (26,789 sq.mi. water); pop. (1941 Canadian census) 722,447; urban 44%. The 1936 census indicated the following racial origins of the population: British, 362,389; Ukrainian, 86,982; German, 52,450; French, 47,683; Polish, 35,136; Scandinavian, 31,504; Dutch, 25,521; others, 66,210. Total Canadian-born, 70%. Capital, Winnipeg; pop. (1941 census) 217,994.

History.—The unicameral legislature consisted of 55 members in 1941, with a coalition government representing the Liberal-Progressive, Conservative, Co-operative Commonwealth Federation and Social Credit parties, headed by John Bracken, premier since 1922. The lieutenant governor in 1941 was R. F. McWilliams. Representation in the dominion house of commons consisted of 17 and in the senate of 6 members.

Education.—Public, elementary and secondary schools are maintained by general taxation. Manitoba university, including a faculty of agriculture and an adult education division, and affiliated colleges in Winnipeg, St. Boniface and Brandon, provides for higher education. Pupils in elementary grades in 1941 numbered 111,932; in secondary, 22,411. Full-time students enrolled in the university 2,564; total registration, 4,116.

Banking and Finance.—Winnipeg, financial centre of western Canada, is western headquarters of 8 of the 12 Canadian banks, and of insurance, mortgage and financial institutions.

Agriculture.—The Manitoba Farmers' federation, a consolidation of all nongovernment agricultural organizations, continued its rural adult education program in 1941. A peak in the trend from a cereal to a mixed agricultural and industrial economy was evidenced during the year. The total gross value of agricultural production in 1940 was $101,368,000.

Communication.—In 1941: Canadian Pacific railway (Manitoba district) total mileage, 3,494; Canadian National railway, 3,061; Hudson Bay railway, 510; Midland railway, 75; Greater Winnipeg water district, 110. Highways in 1941: surfaced, including trans-Canada, 8,756 mi. (gravelled, 8,209; bituminous, 510; concrete, 37). The government-owned telephone system had 79,613 telephones, 129 exchanges and a total wire mileage of 315,924; it operated two radio stations in 1941, one of 15,000 watts at Winnipeg and one of 1,000 watts at Brandon. There was one privately owned radio station of 1,000 watts at Winnipeg and two short-wave transmitters operated in conjunction with it.

Manufacturing and Other Production.—Manufactures (1939) were valued at $134,293,595; minerals (1939), $17,137,930; fisheries, $2,754,254; furs (1940): wild catch, $2,036,728; farms, $847,227; processed in Winnipeg, $821,343; processed in and exported from Manitoba, including furs from other provinces, $6,935,216. A government program of muskrat development, game preserve and trapline regulation achieved success. (J. L. J.)

Mann, Tom (1856–1941), British labour leader, was born April 15 at Foleshill in Warwickshire, Eng. When he was nine, Tom Mann worked as a farmhand; at 11 he laboured in coal pits. He was then apprenticed to a toolmaker and later became a journeyman engineer. In 1885 he joined the Socialist movement.

Showing a flair for leadership, he helped stage a great dock strike in 1889. By 1900 he had led 150 strikes involving 250,000 workers.

Among his works were *A Socialist's View of Religion, Tom Mann's Memoirs* and *What I Saw in China, 1927*. He died in Grassington, Yorkshire, Eng., March 13.

Maple Products. Production of maple syrup and sugar, and the number of trees tapped in the United States in 1941, in 1940 and the ten-year (1930–39) aver-

Maple Syrup and Sugar Production and Trees Tapped in U.S. and Leading States

Marchand, Jean (1883–1941), French painter, was born Nov. 22 in Paris. He illustrated the works of Paul Valéry and Paul Claudel and painted the fresco "La Musique" in the Palais de Challot. His works hang in the Luxembourg museum, the Albertina museum of Vienna, the National gallery of London and the Imperial museum of Japan. Word of his death in Paris reached Vichy, Oct. 10. (See *Encyclopædia Britannica.*)

Marine Biology. Russia was brought into the European conflict in June and so far as can be known its long-range marine programs along the Murmansk and the Black sea ports were abandoned. This event intensified the deadlock on marine research in all European waters. However, in the western hemisphere some progress was made to keep the science active. The development of automatic depth recorders and accurate methods of position finding at sea[1] contributed an important addition to the knowledge of subterranean topography especially about the shores of the North and South Americas in both Atlantic and Pacific oceans. From echo soundings it can be concluded that the topography under the sea is quite like the configurations we are familiar with above sea level. The sub-surface continental slopes in locations where studied, show signs of erosion—submarine mountains are weathered (not mountains of deposition). These submarine slopes, it is estimated, date back to the Pleistocene or ice age. Evidences pointed clearly to the fact that the sea level at one time was at least 10,000 feet lower than at the present.

Another aspect of the physical topography of the ocean bottom[2] concerns the ages of its deposits. This has been approached by workers at the Carnegie Institute of Washington where an investigator has designed a device which can be shot into the mud to any required depth and tube-core samples obtained which subsequently can be studied by a new technique involving the determination of the amount of radium in the mud. From this index, the age of the mud can be accurately estimated. It has been deduced by this method that approximately 1,000,000 years are required to deposit 10 feet of ocean mud.

On the biological side, not even the ocean floor is hidden from the candid camera's[3] eye. In a new technique for deep sea study, a camera with its flash bulb can be sent down to any desired depth, where it can obtain snapshots of areas of between two and one-half and three and one-half feet in size. In the hands of a skilful operator at the Oceanographic institute at Woods Hole, Mass., photographs were taken from relatively shallow shores to half a mile below sea level. Over the Georges Banks fishing grounds along the New England coast, such exposures show crabs, sea snails, starfish, sea urchins, sand dollars, deep sea scallops, tube-building worms and sponges. While great profusion of animal life abounds at these depths, the photographs show no signs of plant life of any kind. These facts imply that the basic organic synthesis is largely performed by the pelagic phytoplankton—perhaps the diatomes standing first in rank. These are then postulated to be followed by zooplankton, especially the copopods which constitute the chief item in the dietary of our food fishes.

In spite of the effort to process all sorts of other fats and oils, whale oil[4] and all the complex factors involved in its extraction held its place in fixing the price structure for all the other fats. While this commodity totalled only about 10% of the world trade in fats, it constituted about 54% of the margarine and lard compounds in Germany, and contributed about 40% of the margarine and 28% of the lard compounds within the United Kingdom. With other fats being allocated to war purposes, new uses of whale oil as food and for industrial processes were rapidly being found.

While extensive damage was done to the Marine Biological laboratory at Plymouth[5] during the earlier months of the year, emergency repairs to the station were effected so that research might be continued although the greater part of the library was of necessity moved to other quarters. Limited use of the motor boats for work at sea also was renewed.

At the Bermuda Biological station[6] the buildings and grounds were leased to the United States government to be used as a temporary hospital, and the books, scientific equipment and supplies were stored in St. George. However, the government aquarium at Flatts with its limited laboratory facilities were made available for continued research on certain problems, and it was proposed by the trustees that temporary buildings be provided for research workers.

In an attempt to learn the habits, breeding places and breeding behaviour of certain game fishes (marlins, swordfish, etc.) the sixth Michael Lerner, American Museum Big Game Fish expedition[7] left Miami, Fla., early in January, for Talara, Peru. From this base near the Ecuadorian border off-shore fishing excursions were to explore the fish populations in the rip, where the warm El Nimo enters the colder Humboldt current. It is within these waters that the swordfish, manta sharks and whales are found feeding on the smaller fish of these two currents. It was hoped that data gathered might materially supplement that already at hand on these forms taken in successive expeditions since 1936, from the North Atlantic, the Bahamas, Australia and New Zealand. It was reported also a study would be made on the large squid which gather in enormous numbers on the surface waters at night. Live specimens were to be shipped back to New York for scientific study at the museum.

Another chapter in ontogeny written by nature, was translated in its essence by a scientist of the Eastern Pacific Zaca expedition of the New York Zoological society[8] concerning the young sailfish (*Istiophorus grey*). While in outward appearance the young resemble somewhat the adult, the internal anatomy belies the extensive changes that are to come. There is no suggestion in the young of replacement of scales with bony scutes; that sharp strong dermal denticles will replace the teeth; that the skull will be moulded into a prehensible snout; that the pliant body will be stiffened at all the joints to become a tense spring, an organic engine to generate power for terrific ramming.

Data gathered on the United States Antarctic expedition[9] it was reported would soon appear in published form. Reports are expected to include the aurora, ice formations, geology, ornithology, radio reception and weather conditions. New details were added to the map of Antarctica by field and aeroplane photos; four new areas of internal disturbance, and 15 new bay inlets were photographed over 400 miles of ice barrier. Gaps in Antarctic mountain chains were filled and the absence of sea level connections between Ross and Wedell seas was confirmed.

Experiments in fish culture at Cornell university demonstrated that fish require roughage[10] in their diet. One of the most efficient and acceptable substances is cellophane; when cut into fine shreds, fish eat it ravenously along with other constituents fed.

From records kept at the Marine station at Naples, it was reported that two sea anemones have lived for a period of over 50 years. (*See* also OCEANOGRAPHY; ZOOLOGY.)

Marine Corps. A military corps forming an integral part of the U.S. navy, it was established by an act of the Continental congress Nov. 10, 1775, and is specially organized and trained to meet the requirements of the navy afloat and ashore. Authorized strength (Nov. 30, 1941) of the corps was 75,000 officers and enlisted men, including organized reserves on duty with the regular force. On Dec. 22, the senate passed a bill to increase the authorized enlistment from 60,000 to 104,000.

The marine corps has four distinct missions with the navy: maintenance of an amphibious striking force as a part of the active fleet; maintenance of marine detachments aboard battleships, cruisers and aircraft carriers as parts of the regular crews; provision of garrisons for safeguards for navy property at all shore stations of the navy both within and outside the continental limits, and provision of landing forces for the navy.

The marine regiment stationed for several years at Shanghai for protection of American interests there was withdrawn in Nov. 1941.

Stations from the Philippines to the Virgin Islands had their garrisons increased in 1941, and the leased bases in the Atlantic from Iceland to Trinidad were given garrisons of marines during the year.

A small garrison of 378 marines on Wake island withstood heavy Japanese attacks for two weeks in Dec. 1941 before they were finally forced to surrender. Another detachment had successfully held Midway island, at the end of the year, against repeated enemy assaults. Marines in the Philippines also saw heavy fighting in Luzon and elsewhere. Some 183 marines in

A NEW TANK LIGHTER, built to carry U.S. light tanks ashore under enemy fire, was shown for the first time to news photographers July 18, 1941 in Onslow bay, North Carolina

Peiping and Tientsin, China were taken prisoners by the Japs.

The fleet marine force under the orders of the admiral of the fleet consisted in 1941 of two triangular divisions made up of the different arms and equipped specially for fleet duty.

Normally one division is assigned to the Atlantic coast and one to the Pacific coast, but their high mobility permits of use in any required theatre of operations, special transports and landing facilities being provided for such use.

Aviation training with naval aviation afloat and ashore is carried out, and such trained aviation units are attached to the divisions and garrisons as required.

Marine corps organized reserves in 1941 were on active duty under emergency conditions.

Officers and enlisted men of the marines are given special courses at the technical schools of the navy and the army, and special marine corps schools are established at Quantico, Va. A large correspondence course is conducted from Washington, D.C.

Officers are commissioned from graduates of the U.S. Naval academy and the distinguished military colleges and from selected qualified enlisted men.

Twenty-four were designated as second lieutenants in 1941 from the senior class of the Naval academy.

The ranks of officers and enlisted men correspond to those of the navy but the titles are those of the army from private to major general.

The commandant of the marine corps in 1941 was Major General Thomas Holcomb, who with an administrative staff is stationed at navy department, Washington, D.C.

Marine Insurance: *see* INSURANCE, MARINE.

Market Gardening.

Production of vegetables in the United States for fresh marketing in 1941 was 6,570,200 tons, about 3% less than the record production of 6,797,400 tons in 1940.

The harvested acreage in 1941 was 1,679,860, about 1% more than the 1,590,770 acres of 1940. Unfavourable weather caused the decrease in yield.

The combined harvest of vegetables for fresh marketing and vegetables for processing was, however, about 13% more than the record combined crop of 1940.

Vegetables grown for processing in the United States in 1941 totalled 11,498,200 tons.

(*See* TRUCK FARMING; *see* also LETTUCE; POTATOES; TOMATOES.)

Table I.—U.S. Acreage and Production of Market Vegetables

	1941 acres	1940 acres	1941 production	1940 production	10-yr. av. production	Unit of measure
Artichokes	10,000	10,600	700,000	848,000	889,000	40-lb. box

Marriage and Divorce.

The most significant influence affecting family life in the United States during 1941 was preparation for national defense. This was especially notable with the lengthening of the year but it is obvious that the full force of national policy and the outbreak of war was not yet generally felt by the American home by the close of 1941. The results evident were multiple, operating upon individual families differently. The most pronounced of these influences was that of the selective draft act. This both hastened and delayed marriages and in some instances stimulated the desire for parenthood. According to a survey,[1] the major effect of the U.S. defense program was to increase marriages in 30 of the largest cities having about one-fourth of the nation's population.

Marriages during the 11 months of 1941 exceeded those of the previous year for the same period by 8.8%. The greatest gains were found in cities having shipbuilding, metal and aviation industries.

The transition of industry from the commercial demands of a peacetime market to that of meeting the productive needs of an arsenal for democracy also affected the family. It led to an overcrowding that in certain localities revived slum conditions, caused much migration of families, changed the standards of living and in some families brought about the withdrawing of both the father and the mother from the home. This problem of both parents working was, of course, not new, but it was made greater as a result of the demand for workers in expanding industries and was bound to increase as World War II continued. Recognition of this problem led the Children's bureau to call a conference on the day care of children of working mothers. The recommendations adopted by this group resulted in the appointment of the Advisory Committee on Day Care of Children, which took over responsibility for a permanent program.

The financial consequences of the U.S. national program were beginning to be felt by individual families. Some enjoyed an increased income with a potential incentive toward conditions making for inflation, while others already felt pressure toward a lower standard of living. The national defense policy and World War II brought emotional and social reactions which had various and conflicting expressions of significance to the family, such as a feeling of fatalism and, up to the declaration of war, a division of sentiment as to national responsibilities, restlessness and the enhancing of social stress. Since family life is sensitive to these individual and social attitudes, there was already need in many communities for such an organization as the Spokane Counsel on Family Life and Education, which announced as its purpose the improvement of family living and of community conditions affecting the family.

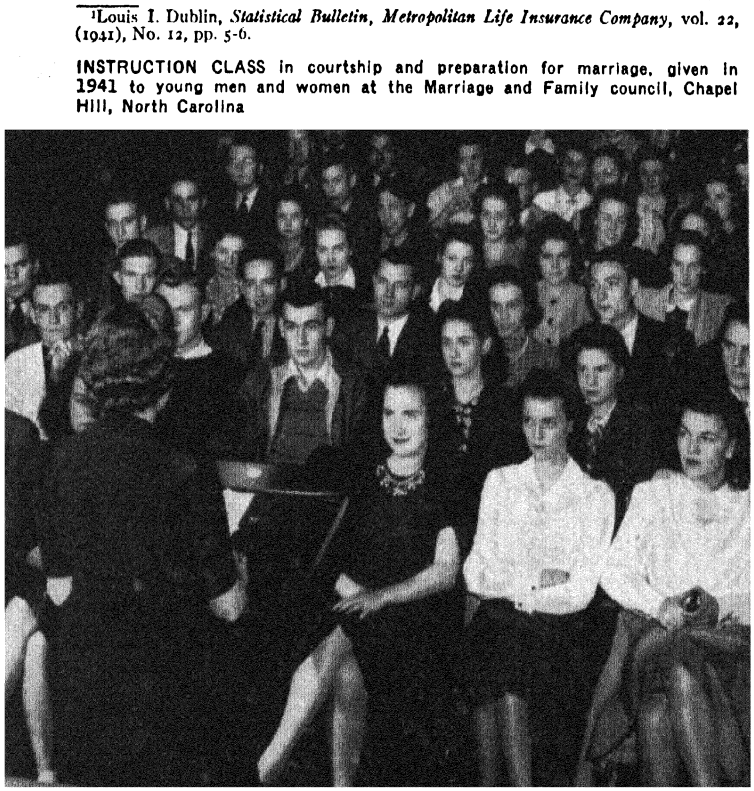
INSTRUCTION CLASS in courtship and preparation for marriage, given in 1941 to young men and women at the Marriage and Family council, Chapel Hill, North Carolina



Development of education in marriage and family life continued its previous momentum. The most significant expression of this interest was the publication of the 1941 Yearbook of the American Association of School Administrators, discussing education for family life. This gave the educational program designed to serve the American home the official recognition of the national organization of those responsible for public school policy. The program made in the college field was beginning to be reflected in high school undertakings. It was also appearing in a greater attention to problems of the home in institutions for Negro students in the south.

This was certain to hasten social progress in the southeast. An example of this greater interest was the Homemaking Institute held at Bennett college, Greensboro, N.C., which had as its topic, "Family Relationships in a Time of Stress."

A great many conferences centring about the interests of marriage and the family were held in various sections of the United States during 1941. The following were representative of different sections and various organizations: The fourth annual meeting of the National Conference on Family Relations, at New York city, having as its general subject "Family Preparedness," an organization that already, although only three years old, has one of the largest memberships of American social organizations; the Mid-Pacific Coast Conference on Education for Marriage, the first of its kind in the Pacific area; the Virginia Conference on Family Relations, an example of the state conferences being held in connection with the National Conference on Family Relations; the National Catholic Conference on Family Life held at Mount Mary college; the Mid-West Conference on Tomorrow's Children at Chicago; the week of intensive study of the medical background of courses in marriage, held at the Duke university medical school and the University of North Carolina under the auspices of the annual April Conference on the Conservation of Marriage and the Family at Chapel Hill; and the meeting of the Connecticut Counsel of Family Relations concerned with developing a program of family education on the secondary school level.

Two problems in contemporary American life were given greater attention during 1941: first, that of old age and ageing, which interested physicians, social workers and sociologists. The National Institute of Health of the United States Public Health Service organized a new unit for research concerning the former—the National Advisory Committee on Gerontology.

The second problem which received more attention than formerly was that of nutrition as it affects family welfare. This was featured at the annual meeting of the American Home Economics association and at various other conferences, and through publications advocating intelligent purchasing by consumers for adequate family diet.

During 1941 there developed a more aggressive attack on the problem of abortion. This was expressed not only in a tightening of legislation and law enforcement but, what was more significant, in an awakening of medical and public opinion to the seriousness of the situation.

The headway that was being made against the diseases that especially endanger marriage and family life met with a setback in 1941. Although the conscripts were examined for syphilis and gonorrhoea and any giving evidence of infection rejected, the

rate of infection in the army and the navy showed that these diseases had become the foremost medical problem of the armed forces.

From preliminary data obtained from 32 states which in the past reflected accurately the trends of the entire country, the United States Public Health service concluded that during the first six months of 1941 the mortality rate from all causes per 1,000 of the population was 11·1 compared with 11·3 for the same period in 1939 and 1940. The birth rate for the same time increased about one for each 1,000 of the population, from 16·6 to 17·4, lifting the rate of national increase from 5·3 for each of the two preceding years to 6·3. The infant death rate remained the same as in 1940 but the maternal mortality continued to show a decided decrease, 20% below the rate for 1940. The increased concern for the high maternal mortality that in times past prevailed in the United States was beginning to bring gratifying results. Contributing to this interest was the publication during the year of the *Proceedings of the First American Congress on Obstetrics and Gynecology* by the American Committee on Maternal Welfare, Inc.

The division of vital statistics undertook again the task of compiling marriage and divorce statistics, a service discontinued after 1933. The gathering of the necessary data for the years 1939, 1940 and 1941 was progressing, and it was hoped that annual reports concerning divorce might be made available subsequent to 1941. If Reno can be used as a barometer, the industrial boom, resulting from defense efforts, was increasing divorces. The number of divorces granted in Reno in September was the largest during any month for two and one-half years.

During 1941 Iowa, Maine, Ohio, Utah, Vermont and Massachusetts were added to the states requiring increased marital examination for the issuance of a marriage licence. Twenty-six states in 1941 required examination by a physician of both bride and groom, including a blood test for syphilis. Seven other states had some type of premarital examination law, and 23 of these states had a prenatal examination law. In addition to the value of this legislation as a defense against venereal diseases, it also, because of a misunderstanding of the meaning of the law, helped to increase the number of persons seeking the more inclusive examination in preparation for marriage advocated by medical specialists and marriage counsellors. In order to distinguish this technique of preventive medicine from the mere testing for venereal disease required by law, some such term as examination in preparation for marriage had become desirable.

Maryland during 1941 voted to include insanity as a ground for divorce.

One of the interesting statistical studies made during the year appears in Table II, which interprets the marriage expectation of white women in the southeast. Since the marriage expectation of women is one of the conditions most influenced by war, this investigation of the situation in one section of the United States before the beginning of World War II has significance for all students of marriage. (*See* also LAW: *Domestic Relations.*)

‡The county clerk may dispense with the examination of the woman if she has an illegitimate child by her intended spouse and he affidavits to support it; or the department of health may dispense with the necessity of its certificates.

Marshall, George Catlett (1880–), U.S. army officer, was born at Uniontown, Pa., on Dec. 31. Commissioned second lieutenant of infantry Feb. 2, 1901, after completing his studies at Virginia Military institute and the Army Staff college, he advanced through the grades to brigadier general in 1936. In 1902 and 1903 he served in the Philippines, also from 1913 to 1916. He was with the American expeditionary forces in France in 1917, on the general staff of the first division, as chief of operations of the first army and as chief of staff of the eighth army corps. After the war he was aide-de-camp to Gen. John J. Pershing for five years. From 1924 to 1927 he was stationed in China; in 1933 he was appointed commander of the Eighth infantry and in 1936 commanding general of the Fifth brigade. On April 27, 1939, President Roosevelt appointed him chief of staff of the U.S. army with the rank of full general. In this office it was his duty to direct and co-ordinate the enormous load of activity that attended the first peacetime military conscription in U.S. history.

On Feb. 20, 1941, Marshall called attention to the critical situation in the far east and said that steps were being taken to strengthen U.S. air power in the Pacific. He endorsed aid to Britain and early in the summer urged congress to extend the training period of conscripts and national guardsmen and to remove the ban on U.S. expeditionary forces outside the western hemisphere. On April 22 he had expressed himself as well pleased with the progress of the new U.S. army which, he said, had "the highest morale I've ever seen."

Marshall was present with other high army and navy officials at the "Atlantic charter" meeting between Churchill and Roosevelt in August.

Martin, Frank Lee (1881–1941), U.S. educator, was born July 7 in Benedict, Neb. He joined the *Kansas City Star* in 1902 and worked as reporter, telegraph edi-

tor and assistant city editor until 1909, when he left to become assistant professor at the school of journalism of the University of Missouri. From 1915 to 1916 he was news editor of the *Japanese Advertiser* in Tokyo, and from 1931 to 1932 he served as exchange professor of journalism at Yenching university in Peiping, China. After serving as associate dean of the Missouri school of journalism from 1930 to 1935, he was named dean in 1935, a position he held until his death in Columbia, Mo., July 18.

Martinique: *see* FRENCH COLONIAL EMPIRE.

Maryland. A south Atlantic state, one of the original 13 states, popularly called the "Old Line state." Area, 10,577 sq.mi., of which 9,887 sq.mi. are land; pop. (1940) 1,821,244. Total urban population 1,080,351, or 59·3%; rural population 740,893, or 40·7%; white 1,516,850; nonwhite 304,394. Capital, Annapolis (13,069). Other cities include Baltimore (859,100), Cumberland (39,483), Hagerstown (32,491), Frederick (15,802).

History.—The governor in 1941, elected in 1938 for a five-year term, was Herbert R. O'Conor; secretary of state, Francis Petrott. The Maryland legislature met for its biennial session January to April 1941; 1,481 measures were introduced and 937 were passed, of which 82 were vetoed by the governor. The new legislative council established in 1939 held hearings, issued research reports on proposed legislation and made its first report to the legislature. Of 118 bills sponsored by the council, 99 or 83% were enacted into law. These included bills placing a state-wide ban on fireworks, regulating instalment selling, providing for roadside control and changing publication notices for constitutional amendments.

Thirty obsolete or duplicate laws were repealed on recommendation of the council. Among the bills sponsored by the council which failed to pass were an almshouse measure, a roadside zoning measure, and a bill regulating building and loan associations—although a measure passed requiring the latter to make reports to the state tax commission. A law was passed providing for a board of natural resources to co-ordinate activities of several state departments concerned with conservation, and the board was organized by the governor. The unemployment insurance law was modified, and numerous tax and motor control laws were passed. The Woman Suffrage amendment was belatedly ratified.

Education.—There were 1,359 public schools (1,145 elementary, 214 high) in 1940, with a total enrolment of 297,031 and a teaching staff of 8,884. The enrolment in 1941 was estimated at 299,132. The state university had an enrolment of 5,297 and a faculty of 936 in 1941. There were five teachers' colleges, with a total enrolment of 1,239 and a faculty of 67. There were 216 private and parochial schools in 1939, with an enrolment of 50,458 and a teaching staff of 2,013.

Public Welfare, Charities.—Direct relief to the amount of $2,091,913 was given to 7,131 persons in the fiscal year ending Sept. 30, 1941. WPA employment for the first 11 months of 1941 was 85,880; cost, $5,680,226. Old-age assistance for the year ending Sept. 30, 1941 was given to 17,639 ($3,888,591); aid to dependent children (mothers' pensions), 16,595 ($2,513,628); blind pensions, 652 ($174,366). Unemployment insurance was given to 40,161 persons in the benefit year April–Nov. 30, 1941; the amount spent for this purpose in the first 11 months of the year was $4,517,296.

Communication.—In 1941 Maryland had a total highway mileage of 15,317, of which 11,091 mi. were rural and 4,226 mi. were maintained by the state. State expenditures on highways for 1941 were $16,696,366. Many roads were widened and improved; 127 mi. were constructed during 1941. A bridge 2,295 ft. long over the Sinepuxent bay at Ocean City was completed. There were 1,374 mi. of railroads in Maryland in Dec. 1939. Water-borne commerce in foreign trade for the first 10 months of 1941 totalled 7,667,206 tons (2,391,936 tons exports and 5,275,270 tons imports). There were 25 airports and seaplane bases in 1941. A new municipal airport was opened in Baltimore Nov. 16, 1941 with combined airport and seaplane base facilities. A total of 335,738 telephones were operated by the Chesapeake and Potomac Telephone company Nov. 1, 1941. Four independent companies operated approximately 700 telephones.

Banking and Finance.—As of June 30, 1941 there were 112 state banks and trust companies in Maryland, with deposits of $402,964,577 and resources of $453,931,479; 12 mutual savings banks had deposits of $229,037,225 and resources of $257,940,054. There were 63 national banks as of Sept. 24, 1941, with deposits of $461,497,000 and resources of $496,224,000. Savings and loan associations numbered about 800. For the fiscal year ending Sept. 30, 1941, state receipts were $67,251,210; expenditures, $63,571,845; bonded indebtedness, $40,179,000.

Agriculture.—Through September the acreage harvested in 1941 was 1,594,300. Total farm income in the state for 1940 was $73,373,000. Rainfall was approximately 10 in. below normal during 1941. Most of the state suffered severe drought during the year, the most abnormal crop year in Maryland's history.

Table I.—*Leading Agricultural Products of Maryland, 1941 and 1940*

Crop	Production		Value	
	1941	1940	1941	1940
Corn, bu	15,164,000	16,335,000	$11,672,000	$11,108,000
Wheat, bu	7,245,000	6,897,000	7,752,000	5,380,000
Barley, bu.	2,028,000	2,008,000	1,257,000	1,024,000
Hay, tons	475,000	553,000	6,918,000	6,130,000
Red clover seed, bu.	23,000,000	24,000,000	246,000	192,000
Tobacco, lb.	29,822,000	32,640,000	10,438,000	10,771,000

Manufacturing.—The total estimated value of manufactures in 1939 was $1,027,354,074; wage earners numbered 141,643; total wages paid were $156,782,654.

Table II.—*Principal Industries of Maryland, 1939 and 1937*

Industry	Value of Products	
	1939	1937
Bread and baking	$22,245,899	$26,566,579
Canning (fruits, veg., soup)	27,302,603	30,881,579
Men's and boys' clothing	34,507,240	33,252,549
Meat packing	34,767,939	40,611,524
Shipbuilding	...	17,925,710
Tinware	35,836,828	37,040,006

Maryland defense contracts exceeded $1,000,000,000 through 1941.

Mineral Production.—The total value of mineral production in 1938 was $9,407,723; in 1939, $11,837,593.

Table III.—*Principal Products of Maryland, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Coal	$ 2,905,000	$ 2,705,000
Sand and gravel	2,827,268	1,848,211
Clay	1,709,524	1,210,947
Miscellaneous, inc. cement	40,697,718	28,491,245

(C. B. S.)

Mascheroni, Edoardo (1859–1941), Italian conductor and composer, was born Sept. 4 at Milan, Italy. Famous as a conductor at Leghorn and Rome, Mascheroni was chosen by Verdi to conduct the première of *Falstaff* at La Scala in 1893. He composed two operas, *Lorenza* (1901) and *La Perugina* (1907), requiems, chamber music and works for orchestra, piano and voice. Mascheroni also conducted in the principal opera houses of Italy, Germany, Spain and South America. He died in Milan, March 4.

Masonic Order. Details of the anti-Masonic crusade, ruthlessly waged by the totalitarian dictators for considerably over a decade, at last reached the non-Masonic writers. In the February (1941) *American Mercury,* Sven G. Lunden states that, while their persecutions of Jews and Catholics "have had considerable publicity, the merciless assaults on Freemasonry . . . are practically an unknown chapter." His article affords a brief summary of Masonic history, with a partial, though impressive, enumeration of the great figures who have made and adorned it. The most conspicuous of the victims was the craft in France, where Scottish Rite Masonry arose, but where in 1941, in both occupied and unoccupied portions, as in the other countries conquered by the dictators, all lodges were closed, their property confiscated and their members "relentlessly pursued and persecuted," according to Meyer Mendelsohn, honorary member of the French supreme council, who wrote in the April *Masonic Craftsman.*

One of the Pétain government's devices for exterminating the order was the publication in the *Journal Officiel* of the names of those previously prominent in Masonry, along with the decrees dismissing them, for that reason, from the public service. By mid-August these lists, still in the

letter C, numbered over 1,500, including such men as former Premier Chautemps, also a member of the French supreme council. Names of British and Americans residing in France were likewise published. In a decree of Sept. 19, nine generals of the army and Henri Mouton, a distinguished member of the *Conseil d'Etat*, the most respected of French tribunals, were retired because of previous Masonic connections. By November, the Vichy regime seemed to have become conscious that it had gone too far and a law was published promising exemption from the official ban of "those who had long since severed such connections or had rendered services of special importance to the state." But since the execution of the law was committed to a small government unit, its effectiveness remained to be proved.

The information concerning the victims was reported as furnished by Bernard Fay, author of *Revolution and Freemasonry, 1680–1800* (1935), French national librarian, who had been commissioned to establish a "museum" for housing documents and paraphernalia of secret societies, which the authorities seized. Fay was denounced editorially in *L'Oeuvre* on Oct. 13 by Marcel Déat, wounded with Laval, who condemned the injustice to faithful officials and defended the order against the charge of subversivism which Doriot, a former communist, had exploited by organizing a "Legion to fight Anglo-Judeo-Masonic-Soviet plutocracy." The charge appeared to be accepted by Kenneth Monroe, who wrote in the June *Scribner's Commentator* what was virtually an apology for the anti-Masonic crusade. Lunden, in the article first above quoted, had forstalled him by showing that "Masons as individuals have founded a great number of modern democratic states" and that "totalitarian hatred for the order" is due to its ideal of equality and the "Masonic dogma of Humanity." That ideal was concretely expressed by the Boise Scottish Rite bodies in presenting an ambulance to the Chinese government, bearing the inscription "Humanity above all"; by the Mother (Scottish Rite) supreme council in appropriating at its Oct. 1941 session $1,000,000 for China relief; by the Imperial Council of the Mystic Shrine in expending a like sum, not only in 1941 but annually for years, on its 15 hospitals for crippled children, of whom about 30,000 have been rehabilitated, and by the Premier Grand Lodge in donating to the British government for defense purposes £10,000 realized from the sale of Masonic jewels, contributed by British Masons. Thus, despite the ravages of war, Masonry, in English speaking countries, continued to function. Statistics for 1941 show, in the 50 grand lodges of the United States and the Philippines (where the largest increase of any, except South Carolina, appeared), 15,507 subordinate lodges and 2,464,590 members; in Canada, 1,378 lodges and 167,729 members; and in the more than 5,000 constituent lodges under the aegis of England's Premier Grand Lodge, about 400,000 members

The North American visit of the duke of Kent, brother of King George VI and Grand Master of the bodies last mentioned, symbolized the link between them and the overseas craft as did the wide publicity given by the nazi press to President Roosevelt's membership in the order. Even in prostrate France, according to Lunden, Masons, like the early Christians, "still meet in locked homes and secret circles" and, although statistics there, as in the other conquered countries, were naturally difficult to obtain, the French minister of the interior Pierre Pucheu, admitted in a public statement that there were "not more than 100,000 Masons in France." Coming from a hostile source, this would seem to constitute an approximately minimum figure.

Massachusetts.

A north Atlantic state of the U.S.A., admitted to the union Feb. 6, 1788; popularly known as the "Bay state." Area, 8,257 sq.mi.; pop. (1940) 4,316,721 (3,859,476 urban, 457,245 rural). Capital, Boston (770,816). Other principal cities are Worcester (193,694); Springfield (149,554); Fall River (115,428); Cambridge (110,879); New Bedford (110,341); Somerville (102,177); Lowell (101,389); and Lynn (98,123).

History.—Governor Leverett Saltonstall was inaugurated Jan. 2, 1941 for his second two-year term, following the election two months previously in which the Republican party again won most of the elective offices of the state. Other state officers in 1941 were as follows: lieutenant governor, Horace T. Cahill (Rep.); secretary of state, Frederic W. Cook (Rep.); treasurer, William E. Hurley (Rep.); attorney-general, Robert T. Bushnell (Rep.); auditor, Thomas J. Buckley (Dem.). The state senate comprised 40 members (25 Republicans, 15 Democrats); the house, 240 members (143 Republicans, 97 Democrats).

The legislative session in 1941, biennial, was the longest in the history of the commonwealth—171 days in session from its convention, Jan. 1, to prorogation, Nov. 1. Legislation for defense and war constituted most of the action. The net state assessment on municipalities for 1941–42 was the lowest since World War I, with the exception of 1931–32. The net direct debt of the commonwealth between 1938 and 1941 was cut down from about $40,700,000 to $15,937,000.

When the national guard of the commonwealth was taken into army service, a new state guard of 6,000 was organized and was equipped, trained and ready for home police duty by the end of 1941.

The commonwealth during 1941 took back the East Boston airport from the city of Boston, with due compensation, and allotted substantial amounts to the federal government to help make it one of the best airports in the country. The state also bought land at New Bedford and was establishing there an auxiliary airfield for greater Boston.

One of the most productive acts of the governor was the formation of the Massachusetts Industrial Committee for National Defense. Civilian organization for home protection and regulation of consumption was rapidly completed under the direction of the committee on public safety.

Education.—In 1941 there were 2,019 elementary schools with 399,716 pupils and 14,220 teachers; 183 junior high schools with 105,006 pupils and 4,145 teachers; 263 senior high schools with 179,790 students and 6,959 teachers. The ten state teachers' colleges had a combined enrolment of 2,705 and faculties of 219. The state college at Amherst had 1,263 students and 135 faculty members.

Public Welfare, Correction.—State and municipal aid was extended to an average of 298,489 as of Dec. 1, 1941. Total yearly expenditures were $72,245,195 and were divided among the various types of assistance as follows: old age, $30,402,520; aid to blind, $333,661; unemployment compensation, $17,927,000; general relief, $12,623,649; aid to dependent children, $8,624,463; child guardianship, $2,333,902. The average number of WPA employees during the year was 57,250; expenditures were $42,526,000.

State correctional institutions included a state prison, a state prison colony, a reformatory for men, a reformatory for women and a state farm for the criminally insane, with a total average in 1941 of 5,655 inmates. Total expenditures in 1941 were $2,581,177.

Communications.—The total mileage of highways in 1941 was 23,132 (rural, 17,397 mi.). Highway expenditures in 1940 by the state government were $16,029,000, of which $11,328,000 was for construction, maintenance and administration. Railroad mileage in operation was 4,298. Exports in the first nine months of 1941 totalled $18,053,003; imports, $201,423,407. There were 44 commercial airports in Massachusetts in 1941. Telephones in use numbered 973,274.

Banking and Finance.—There were 908 state banking institutions in 1941 (191 savings banks, 182 co-operative banks, 70 trust companies, 465 credit unions) and 124 national banks. Total banking deposits were $5,101,100,082; total assets, $6,918,345,108. There were also 26 federal savings and loan associations, with resources of $126,901,971.

The state debt in Nov. 1941 (net direct) was $15,936,647.

Agriculture.—The total estimated value of agricultural production in 1941 was $75,609,000; the total acreage of field crops harvested was 432,970. Cash income from crops was $31,123,000; from livestock, $44,486,000; from government payments, $619,000.

Table I.—*Principal Agricultural Products of Massachusetts, 1941 and 1940*

Crop	1941	1940
Tobacco, lb.	10,031,000	10,141,000
Cranberries, bbl.	510,000	332,000
Apples, commercial, bu.	2,174,000	2,174,000
Potatoes, bu.	2,402,000	2,848,000
Asparagus, crates	156,000	166,000
Onions, bags	411,000	434,000
Hay, all, tons	450,000	491,000
Corn, grain, bu.	287,000	287,000
Corn, silage, tons	294,000	270,000
Oats, bu.	204,000	170,000

Manufacturing.—The estimated value of manufactures in 1941 was $3,500,000,000; the average number of employed in Dec. 1941 was 600,000 and average weekly wages were $16,572,515.

Table II.—*Principal Industries of Massachusetts, 1939 and 1937*

Industry	Value, 1939	Value, 1937
Woollen and worsted goods	$193,201,168	$232,513,060
Boots and shoes, other than rubber	140,045,664	150,999,351
Electrical machinery	117,921,691	148,798,048
Cotton goods	103,539,165	120,292,300
Printing and publishing	97,506,593	106,604,044
Clothing	93,358,623	80,502,504
Bread and bakery products	70,157,717	79,458,398
Foundry and machine shop products	75,067,337	88,706,980

Mineral Production.—The principal minerals of Massachusetts, and their individual outputs in 1940, in short tons, are as follows: coke and by-products, 1,130,311; lime, 108,797; stone, 2,176,340; sand and gravel, 3,563,760. (L. SL.)

Massachusetts Institute of Technology.

An institution of higher technical education, at Cambridge, Mass.

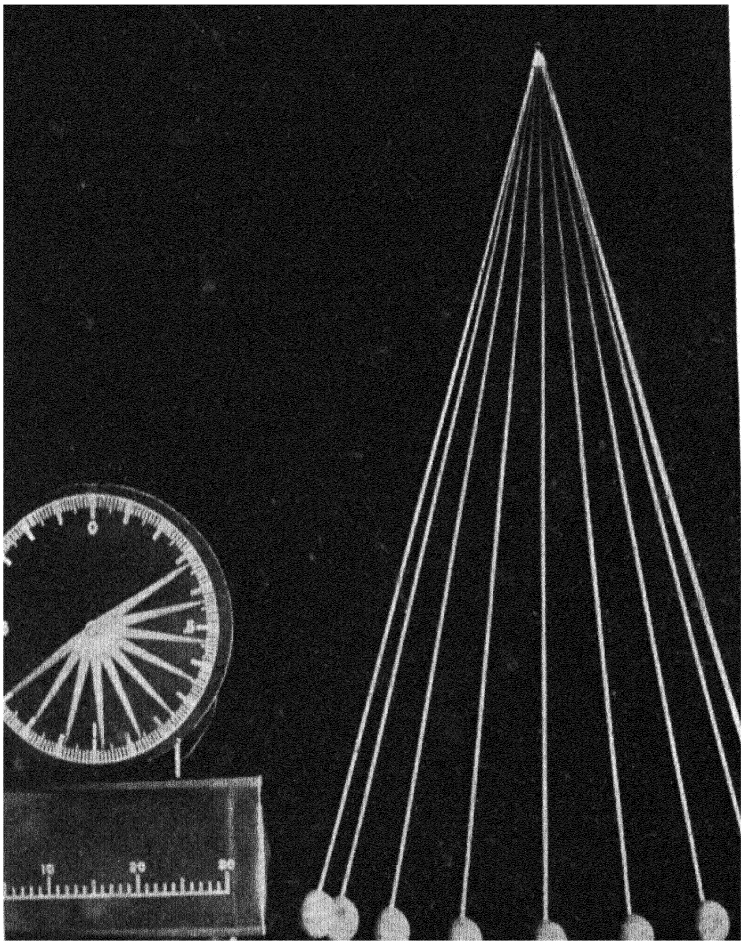
During 1941 the institute continued its normal educational program in addition to undertaking a great amount of work for national defense. It provided experts from its staff to serve on various advisory or operating committees of the government. The extent of this service is indicated by the fact that nearly 100 members of the M.I.T. staff were engaged in this type of service in 1941.

Under the auspices of the United States office of education, the institute offered 15 special engineering defense training courses and more than 1,000 students had completed the courses in 1941. Many special students from the army, navy and weather bureau also were given postgraduate training in weather forecasting, an essential feature of modern warfare.

The most important of the institute's activities in the national defense field was its research program. More than 65 separate contracts for research and development were in force in 1941. Several of the contracts included more than one project, so that the number of individual researches under way was more than 70. Of these contracts more than half were with government agencies and the rest with industrial firms. This defense research involved an increase in expenditures of approximately two-thirds of the institute's normal operating budget and required an increase in staff appointments of approximately 50%. The institute's normal operating budget, excluding the special defense program, for the year 1940–41 totalled $3,355,000; gifts received totalled $888,180; educational plant assets stood at $16,724,000, an increase of $396,000; and the book value of endowment funds totalled $35,984,500, a decrease of $31,000 during the year.

Enrolment for the academic year 1941–42 totalled 3,055, of which 679 were graduate students. Seventy-one percent came from outside Massachusetts, 64% from outside the New England states, 33% from outside the North Atlantic states and 6% from outside the U.S. There were 194 foreign students from 37 foreign countries. (K. T. C.)

VISUAL DEMONSTRATIONS of mathematical formulas were set up and photographed with high-speed cameras in 1941 at the Massachusetts Institute of Technology. The photograph illustrates $T = \pi\sqrt{\frac{l}{g}}$, where T equals the time of the pendulum swing, l the length of the pendulum cord, and g the acceleration of gravity. At the left are a clock and a scale to show the length of the swing



Mathematics. Mathematics in the U.S. was characterized by intensive research in all fields of pure mathematics and by the development of centres of instruction and research in applied mathematics. In pure mathematics, the trend toward the abstract continued, with interest centred on abstract algebra and topology. Many problems of analysis were investigated in abstract settings: the year 1941 brought important advances in the study of integration in linear topological spaces and of the Riemann hypothesis in function fields. The appearance of Wintner's *Analytical Foundations of Celestial Mechanics* and of Widder's *The LaPlace Transform* emphasized, however, that there was no lessening of interest in the older fields. New results included, among others, a proof of the ideal Waring theorem for $n=6$; new methods for the construction of diabolic magic squares; a significant extension of Cauchy's integral formula; the solution of a generalized form of the celebrated Problem of Plateau; a solution of the inverse problem in the calculus of variations; a new system of postulates for the theory of probability, based on Boolean algebra; solution of problems connected with the bending and buckling of elastic plates.

Interest in applied mathematics was an outgrowth of war. Dr. Fry's report on *Industrial Mathematics* emphasized that industry needs mathematicians to serve as consultants, and that no centres existed for their training. In response to this report, a program of advanced instruction and research in mechanics was developed at Brown university, an Institute for Applied Mathematics was established at New York university, and Massachusetts Institute of Technology announced the formation of a Research Center of Applied Mathematics.

The War Preparedness committee of the A.M.S. and the M.A.A. (1) published reports setting forth mathematical requirements of workers in industry and of members of various branches of the service and recommendations to secondary schools and colleges for meeting these requirements; (2) examined the demand for mathematicians, and the supply—already decreased by 25%; a statistical report with recommendations for the deferment of mathematicians in order to conserve the supply was expected at the end of 1941.

South America.—*Revista de la Universidad de Tucumán—Serie A: Matemáticas y física teórica* is an important new journal (first two numbers dated Dec. 1940) in South America for the publication of mathematical research.

Europe.—In Europe research continued. Erich Hecke developed a theory which establishes a connection between modular functions and Dirichlet series; it yields a connection between the theory of modular functions and multiplicative number theory. Publication of books and periodicals continued without interruption in Great Britain. Journals at least continued to appear in Germany and Italy; and publication of journals was resumed, even if slowly, in the occupied countries.

Japan.—In Japan the number of younger mathematicians continued to increase rapidly; they worked at the world's level. Subjects of investigation included abstract algebra, ergodic theorems, partially ordered linear spaces, and spectral theory in Hilbert space. *Free Groups* (Osaka University Colloquium Lectures, vol. 6, in Japanese) by S. Iyanaga was published. With the appearance at the end of 1940 of the first number of the new periodical *Memoires of the Kiushu Imperial University, Series A, Mathematics*, Japan had at least ten periodicals devoted to pure and advanced mathematics. In late 1940 Teiji Takagi of Tokyo

perial university was decorated with the "Order of Culture" · earlier works on class field theory.

U.S.S.R.—Mathematicians of the U.S.S.R., producing an ever-reasing amount of research, were signally honoured in the first ards of the Stalin Prizes. First prizes, of 100,000 rubles, went Vinogradov for work on the Goldbach problem, to Gelvich · work on the theory of gun fire, and to Muskhelishvili for rk on elasticity; second prizes of 50,000 rubles were awarded Kholmogorov and Khinchin for work on probability, to Pon-agin for his book *Topological Groups* (published also in an glish edition by the Princeton University press), and to Sob-v for research on partial differential equations. A rapproche-nt, signalized by an exchange of greetings, took place between : mathematicians of the U.S.S.R. and those of the U.S. late 1941. Both of these countries continued to receive large num-:s of mathematicians from those parts of Europe under Ger-n control.

athews, Shailer (1863–1941), U.S. theologian and educator, was born May 26 in Portland, Me. was dean of the University of Chicago Divinity school, 1908–33, and dean emeritus after 1933. A trustee of the Church ace Union founded by Andrew Carnegie, he was an untiring ·ocate of peace. In 1937 he headed a committee appointed in neva to convoke a world conference for international peace ough religion. Among his later works were: *The Atonement l the Social Process* (1930); *Creative Christianity* (1935); *w Faith for Old: An Autobiography* (1936); and *The Church l the Christian* (1938). He died in Chicago, Oct. 23. (*See cyclopædia Britannica.*)

atsuoka, Yosuke (1880–), Japanese statesman, was born in Yamaguchi-ken of an poverished samurai family. In 1893 he went to the United ites, became converted to Christianity and worked his way ough the University of Oregon law school, graduating in 1900. returned to Japan and was appointed vice-consul at Shanghai, 04. He then spent 15 years in the Japanese foreign service. In 18 he was appointed secretary to the premier of Japan and ended the Versailles peace conference as an interpreter. In 32 he represented Japan before the League of Nations. In 40 he became foreign minister. In 1941 he made an extended) to Berlin, Rome and Moscow, secured a pact of nonaggres-n with Stalin and aligned his country more closely with the me–Berlin axis. On Feb. 21, 1941, Matsuoka warned that glo–U.S. defense measures in the far east might lead to a ngerous situation." Three days later, he told the diet that the ite race must cede "Oceania" to Japan; he defined "Oceania" a huge area in the Pacific capable of supporting 500,000,000 ople. He lost his post as foreign minister when Premier Konoye *v.*) reshuffled his government on July 18, 1941.

eat. With the exception of pork, production in 1941 of the principal meats (beef, veal and lamb) in the United ites exceeded all previous years, as did consumption. The 1941 consumption was nearly 19,500,000,000 lb., about 1,000,000,000 lb. more than that of 1940, the American Meat institute reported.

Table I.—*Meat Processed under Federal Inspection Jan. 1 to Dec. 1, 1941 and 1940*

	1941 lb.	1940 lb.
Meat in cure		
Beef	122,601,000	108,448,000
Pork	2,598,722,000	2,679,000,000
Smoked and/or dried		
Beef	54,506,000	47,310,000
Pork	1,538,559,000	1,055,188,000
Bacon, sliced	292,201,000	292,779,000
Sausage		
Fresh	132,548,000	123,223,000
Smoked and/or cooked	501,401,000	555,568,000
Dried or semi-dried	113,712,000	111,424,000
Meat loaves, head cheese, chili, jellied products	130,133,000	110,294,000
Cooked meat		
Beef	6,199,000	6,638,000
Pork	233,927,000	221,744,000
Canned meat		
Beef	96,975,000	68,581,000
Pork	396,762,000	251,096,000
Sausage	79,135,000	33,411,000

U.S. exports during the first two years of the war (the period ending Aug. 31, 1941) were 231,101,000 lb. of pork and 494,173,000 lb. of lard, with shipments of meat to Great Britain subsequently expanding. Still greater increases in all meat production were scheduled for 1942. The British ministry of food announced during the first week in Jan., 1942, that the millionth ton of lend-lease food from the United States had arrived in the United Kingdom. (For details as to the number of animals produced and the number converted into meat and meat products *see* CATTLE; HOGS; LIVESTOCK; POULTRY; SHEEP; *see* also BACON; FARM INCOME for lend-lease shipments of meat to Britain.)

Table II.—*United States Storage Holdings of Meat Jan. 1, 1941 and 1940 and 5-yr. Average*

	1941 lb.	1940 lb.	5-yr. av. lb.
Beef, frozen	110,048,000	95,513,000	80,019,000
" , in cure	19,905,000	14,181,000	15,305,000
" , cured	5,770,000	3,630,000	4,053,000
Pork, frozen	177,783,000	96,506,000	209,255,000
D.S. pork, in cure	47,697,000	38,950,000	40,213,000
" " , cured	28,386,000	22,030,000	24,635,000
S.P. pork, in cure	137,370,000	121,331,000	157,158,000
" " , cured	77,820,000	68,444,000	92,977,000
Lamb and mutton, frozen	7,951,000	6,432,000	5,317,000
Frozen and cured trimmings	104,805,000	72,982,000	93,573,000
Lard	180,463,000	171,020,000	152,619,000
Rendered pork fat	4,982,000	5,445,000	..

Medical Research, Committee on: *see* SCIENTIFIC RESEARCH AND DEVELOPMENT, OFFICE OF.

Medicine. Stimulated by the military emergency and by the great advances made particularly in fields related to chemistry, the glands and the vitamins in recent years, investigations were especially extended along those lines. Investigations also were concerned with the viruses and the diseases that they cause and with the new techniques in surgery.

Chemical Therapy.—Outstanding among the investigations in the field of chemistry during 1941 were the new derivatives of the sulphanilamide drugs. The chief value of the new derivatives is that they are less toxic than sulphanilamide but equally effective. The sulphonamide group includes these drugs, which have been definitely recognized: sulphanilamide, sulphapyridine, sulphathiazole, sulphadiazine and sulphaguanidine. Moreover, other sulphonamide derivatives, called promin and succincyl sulphathiazole, are undergoing active investigation. Promin was reported effective in tuberculosis in guinea-pigs, but there were not sufficient studies in human beings to establish any definite merit.

Extensive use of sulphonamide drugs has aided in reducing the death rate from pneumonia to 10% in contrast with approximately 33% before the new drugs became available.

The use of the sulphonamide derivatives was extended to the treatment of influenza without, however, any conspicuous success. In meningitis, in all conditions involving the streptococcus, in gonorrhoea, in chancroid, in trachoma (an inflammation of the eyes), in dysentery, in gas gangrene and in many other conditions they were found to be invaluable. For skin disorders sulphathiazole in an ointment was used for some previously resistant diseases.

Studies made in the Panama Canal Zone showed that a shortage of quinine would not be fatal because the sulphonamide derivatives could be substituted for quinine with considerable success in cases of malaria.

By a combination of the use of sulphathiazole and heat, cases of gonorrhoeal infection were cured in from three to five days, the method being equally valuable for women and for men.

In studies made in California, sulphathiazole given together with anti-plague serum saved 98% of mice which had been infected experimentally with plague germs. The possible spread of plague during war was given special consideration at a national conference called by the United States Public Health service.

Investigators at Johns Hopkins university found that in cases of severe burns sprays of sulphadiazine were helpful in preventing serious scarring and in aiding healing.

Heparin, an anti-blood-clotting substance developed from the lung material of cows and from other tissues, has immense value in preventing the clotting of blood. Already it has been applied in the treatment of the blocking of the blood vessels in the legs and the blood vessels generally after surgical operations. It has been recommended for use in the treatment of the blocking of blood vessels in the heart and for the breaking up of blood clots in the interior of the heart. Investigators have found a derivative of spoiled sweet clover, coumarin, which apparently has the ability to prevent clotting of the blood. Studies on human patients have been made with some degree of success.

Distressed by the possibility of epidemics breaking out in air-raid shelters, the British experimented with a mist of propylene glycol sprayed into the air and reported that it was largely effective in controlling the spread of air-borne infections. The method has certain disadvantages which make it unlikely that it will be adopted on a large scale.

In certain forms of tremor associated with such conditions as Parkinson's disease, or the shaking palsy, belladonna root was found to be of value. Although reports from Europe indicated that only the Bulgarian belladonna was satisfactory for the purpose, experiments carried out in the United States showed that the American belladonna root is just as effective.

Glands.—Outstanding was the release by the United States government of the product called stilbestrol, which is a synthetic substitute for the female sex hormone. Particularly useful is a drug of this type during the climacteric in women.

Interesting experiments were carried on involving the injection of the male sex hormone, called testosterone propionate, into women in cases of cancer. This male sex hormone acts in controlling the stimulating activities of the female sex hormone within the woman's body. The use of this product will stop the flow of milk in a nursing mother. By a technique discovered some years ago pellets of the hormone can be implanted beneath the skin, from which they are slowly absorbed, permitting the effect to last for some time.

These same glandular materials were found to be definitely related to the appearance of pimples and blackheads on the skin of young boys and girls. Experiments were being made to determine how these materials could be used in the control of this unpleasant but not too serious condition.

Probably more work was done on the so-called sex glands during 1941 than on any other of the glandular products, primarily because they seem to be so fundamental to the whole structure and activity of the human body. Thus, they have been shown to be related to the shaping of the bones of the body; they also account for differences in the formations of the bodies of men and women.

Among other qualities discovered in relation to the female sex hormone substitute (called stilbestrol) was the way in which it can work together with insulin to keep down blood sugar in diabetes. Some reports indicated the value of the product for "sick headaches" in women when these are due to glandular action. Apparently some women react more definitely to these products than others, and cases were reported of sensitivity to the drug, with the usual nausea, vomiting and other signs of sensitivity. The male hormone seems to stimulate growth of prostatic tissue and the female material seems to inhibit such hypertrophy.

An extraordinary announcement was the report that pregnancy could be diagnosed by a skin test based on the use of the fluid secreted by the breasts of women previous to childbirth. Investigators at the University of Illinois college of medicine said that the test would be valid as early as two weeks after the time when the woman became pregnant. Studies made in other laboratories indicated that the test had value, but the investigators were not able to obtain a degree of accuracy much above 80%. (*See* also ENDOCRINOLOGY.)

Vitamins.—The announcement that two vitamins of the B complex, known as pantothenic acid and para-aminobenzoic acid, were definitely related to the growth of hair and to the prevention of graying of the hair aroused nation-wide interest. Studies already made indicated that the use of these vitamins had a relationship to the graying of hair, although there was some doubt as to what was the best dosage to be used in individual cases. There seemed to be no reason to believe that any vitamin yet known was important in growing hair on the human being.

Chemical studies apparently have shown that certain well-known chemicals are related to vitamin products. Thus, one report showed that manganese is necessary for the development of vitamin C in tomatoes. Another report showed that inositol, which is a part of the vitamin B complex, may be a convenient form for putting iron into enriched bread, in connection with the government's nutritional campaign.

Vitamin B complex was the centre of interest, with new evidence of its great value, through the nicotinic acid that it contains, for controlling pellagra and eliminating the 7,000 deaths which used to occur annually from this disease in the south.

Thiamin, which is vitamin B_1, is related to appetite, and it was found that even hogs which failed to get proper amounts of thiamin became less hoggish.

For years it was thought that the drinking of alcohol was responsible for the hardening of the liver that takes place in chronic alcoholics. Apparently, however, the alcohol is only incidental as a cause for this condition. The failure of the chronic alcoholic to get proper amounts of protein and of thiamin is much more important in producing this condition.

As part of the national campaign for nutrition in defense, attention was given to the preparation of tablets of vitamins to be used by American soldiers in Iceland and Alaska and to the proper incorporation of vitamins in the emergency diets used by soldiers far removed from their bases.

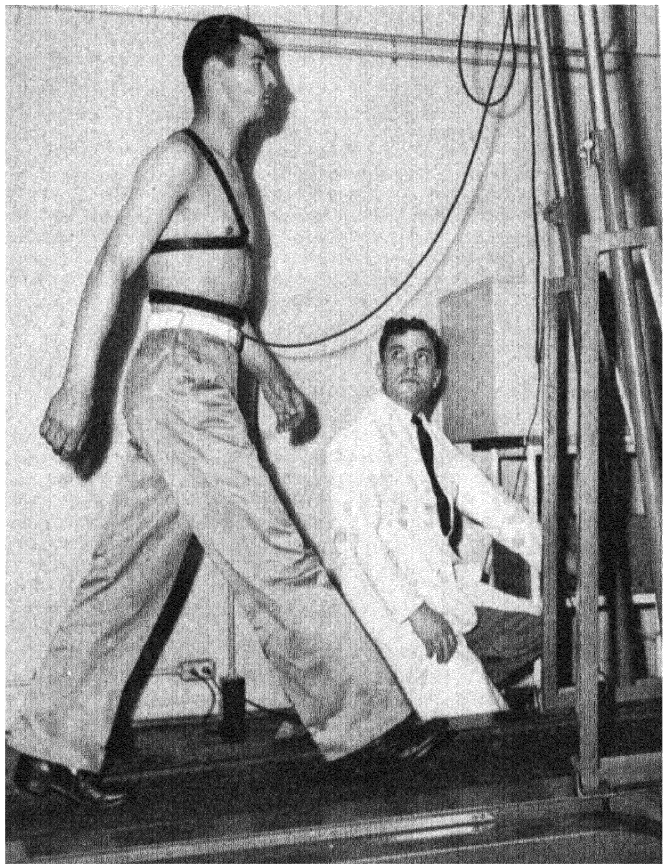
As a means of overcoming deficiencies in the national nutrition, formulas were developed for enriched bread which would contain extra thiamin, riboflavin, iron, calcium and phosphorus. Regulations were established for the inclusion of vitamin A in oleomargarine and for the addition of iodine to salt.

One group of investigators reported that the use of vitamin C after operations and during convalescence aids the healing of wounds. Another group of researchers found that vitamin C is useful in overcoming toxic reactions after the use of preparations of arsenic in the human body, such as arsphenamine, which is given in the treatment of syphilis.

Vitamin B_6, or pyridoxine, was the subject of intensive experimentation related to muscular atrophy and Parkinson's disease. (*See* also VITAMINS.)

Infections and Viruses.—Since Pasteur first established the germ causation of disease, medicine has been able to isolate the causes of many infections, the germs responsible being visible in most instances with an ordinary microscope. Such are the germs that cause diphtheria, typhoid, plague, tuberculosis and many similar diseases. More recently medical interest has centred on viruses which are so small that they cannot be seen with an ordinary microscope, so small, in fact, that they will pass through the pores of a clay filter. These viruses lie between living organisms and inert chemical substances. They have, however, the power to grow and many of them are definitely related to the causing of certain diseases. Most conspicuous among the virus diseases are influenza, infantile paralysis and epidemic encephalitis, or inflammation of the brain. On these virus diseases particularly medicine concentrated its attention in 1941.

Influenza is particularly important because health authorities continue



TESTING THE VALUE of supplementary vitamins in the diet of the U.S. army, at the University of Minnesota in 1941. After taking vitamin pills of unknown potency, a soldier walked for one and a half hours on a treadmill with electrodes strapped to his chest to record heart action

to predict a return of the severe epidemic that devastated the world in 1918. Fortunately several forms of one virus have been identified as responsible for influenza. This virus has been cultivated in the chicken embryo. Evidence was also developed that mosquitoes might be carriers, particularly the mosquito called Culex tersalis.

It has been found that a vaccine can be developed from the growing virus which, when injected into the body, will set up resistance against influenza. This is called a protective vaccine. There was good evidence that it aids in shortening the attack or in curing the influenza once it has developed. Almost at the end of the year, however, came a report that the fluids in the nose during an attack of influenza contain antisubstances against the disease, and early experiments seemed to indicate that the development of this fluid might yield a specific preventive of influenza.

Similarly, during the year several different viruses were found associated with epidemic encephalitis, which was a most serious condition during 1941, particularly in North and South Dakota, Montana and Idaho. Three hundred and forty cases were reported in a single week in North Dakota. Altogether more than 3,000 persons were affected during the summer of 1941.

Information became available that the virus of this disease could reach man not only through infected animals but also through infected chickens. This disease sometimes occurs in a form that is transmitted from horses to man, known as epidemic equine encephalomyelitis. Cases of the horse type were found in Texas, where it became necessary to destroy many horses because of the disease. Since this condition is of the type that might be spread more particularly by movements of great bodies of men associated with war, epidemiologists considered the possibility of epidemic encephalitis as a war disease.

For infantile paralysis it was established definitely that the disease can be transmitted, like typhoid, by healthy carriers who eliminate the virus from the body by way of the bowel. Moreover, the transmission of the disease would seem to be in most instances directly from persons who have the disease, but the possibility also exists that flies or other insects, feeding on human excretions, could carry the virus from such excretions to healthy persons.

Toward the end of 1941 came reports confirming the value of the treatment developed by Miss Kenny of Australia for the acute nerve manifestations of infantile paralysis in the early stages. Previous practice involved application of splints and braces and enforced rest. The Kenny method applies alternate heat and cold and other methods of stimulating circulation in muscles, also controlled movements of muscles to keep the tissues in the best possible condition to take over as soon as the acute inflammation of the disease has passed.

Blood Pressure.—Significant observations on the cause and treatment of high blood pressure were the focus of medical interest in 1941, especially the view that interference with the circulation of the blood through the kidney affected the development of a substance called angiotonin and a substance called renin, definitely related to the cause of high blood pressure or opposition to the substance that causes high blood pressure. Many patients were treated successfully by this technique, but the substances were difficult to prepare, exceedingly costly and sometimes had toxic reactions. Nevertheless, work was continuing on a large scale because this seemed to be the most significant lead ever developed as a means of controlling high blood pressure.

Insulin.—The patents for insulin expired Dec. 24, 1941. Congress passed new legislation providing for complete control of the quality of the product through multiple assays conducted in the National Institute of Health under the authority of the Food and Drug administration.

Aviation.—Many studies on aviators indicated that most aeroplane catastrophes are due to difficulties with the physical condition of the pilot rather than with the machine. New techniques for improving vision, supplying oxygen and testing psychological conditions in fliers were introduced, particularly in military aviation. For aviators at extremely high altitudes where the temperature may reach 40° below zero, new types of uniforms were developed to keep the pilot and the gunner warm.

Cyclotron.—A new cyclotron was developed in 1941 which can create 200,000,000 volt energy.

Shock Treatment.—In the treatment of certain forms of insanity, electric shock under complete control seems to be equally as useful as the kind of shock caused by insulin or by metrazol. Investigators also introduced lobotomy, a technique in which sections are taken from the frontal lobes of the brain. This technique was reported as especially valuable in cases of insanity with depression.

Rickets.—In the treatment of rickets, investigators tested the effects of one large dose of vitamin D injected directly into the buttocks as opposed to the giving of small doses repeatedly throughout infant and child life.

Rocky Mountain Spotted Fever.—An anti-serum was discovered and used successfully in cases of Rocky Mountain spotted fever. Reports from the United States Public Health service laboratory indicated vast benefit from the use of this substance in 20 cases.

Surgery.—Vitallium is a new alloy of chromium, nickel and cobalt, or molybdenum, first produced for use in dentistry. Surgeons found it extremely valuable in 1941 for the making of plates which are used to repair defects in the skull, also in reconstruction of the hip after serious damage or in cases where that is necessary to control some forms of hip-joint disease, and for filling eye sockets after removal of an eye.

Surgeons also concentrated on operations on the sympathetic nervous system associated with the control of high blood pressure. From the University of Chicago came reports that the operation on the sympathetic nervous system for high blood pressure had brought relief in 11 cases. Such cases, however, must be most carefully selected. The operation is not attempted on persons over 40 years of age.

Emphasis on the avoidance of the use of laxatives and of early operation in appendicitis, together with improvements in anaesthesia and post-operative care, brought the death rate from appendicitis to a new low record; namely, 8.9 per 100,000 population.

World War II surgery concentrated on new plastic operations and particularly on the use of the sulphonamide drugs to prevent secondary infections after operations. Preparations of sulphonamide derivatives were put into the abdominal cavity following abdominal operations, applied directly to the surgical wound where there was danger of infection through the incision. (*See* also SURGERY.)

Blood Plasma.—Especially important in surgery was the development of the use of dried blood plasma as a basis for blood transfusion. Late research indicated the possibility that the dried blood plasma from cattle might be used as a substitute for human plasma. Hundreds of thousands of quarts of plasma were in preparation for uses of the U.S. army and navy as well as that of the British military personnel. One technique involved the injection of blood directly into the bone marrow, using especially the breast bone, a method exceedingly valuable in children or in cases in which it is difficult to get blood directly into the veins.

Cancer.—Special studies on cancer brought information that cancer of the lower lip may come from chronic sunburn with repeated irritation of the lip. Cancer of the mouth was also related to the continuous use of chewing tobacco, which may act as an irritant. Other studies on cancer were concentrated on the use of metallic substances submitted to the cyclotron and thus made radioactive. Especially significant were the tests made on radio-strontium used in bone cancer. The radioactive metal is made in the atom-smashing cyclotron and carried directly to the affected bones. Early reports indicated relief of pain.

Dye substances containing lithium and boron were tested as to their effects on cancer in mice.

Chemical studies indicated definite relationship between glandular activities and cancer, and also the possibility that certain substances derived from vitamins and proteins might have specific relationships to the prevention of cancer. Also *see* articles on specific diseases.)

Medicine in the War.—To meet the needs of World War II, American medicine began organizing in 1940. The American Medical association circulated a questionnaire to every physician in the United States, and had available in 1941 complete information under 82 different classifications for 180,000 physicians. Furthermore, some 25,000 specialists were classified as to their professional ability, leadership, administrative ability, teaching qualifications and other factors. Another survey concerned doctors especially trained in industrial medicine.

On Oct. 30, 1941, the president of the United States signed an executive order establishing the Procurement and Assignment Service for Physicians, Dentists and Veterinarians in the office of defense health and welfare. This agency was to be controlled by a board of five physicians and had a full-time executive office in Washington, a regional office in Chicago in the headquarters of the American Medical association, and suboffices in each Army Corps area. The suboffices in the individual corps areas were also administered by boards, including physicians, dentists and a veterinarian, also representatives of hospitals and of medical education.

A duplicate of the first American Medical association roster was provided through the National Roster of Scientific Personnel in Washington. By utilizing these materials and agencies the names of physicians capable of giving service to the army, the navy, public health, civilian defense, industrial medicine and many other agencies, became available, and such physicians may volunteer for service as needed. In his executive order, the president instructed federal agencies requiring physicians, dentists and veterinarians to secure them through the Procurement and Assignment service.

Personnel.—Through the division of medical sciences of the National Research council, under the directorship of Dr. Lewis Weed, committees were established covering medicine, surgery, infectious disease, shock, blood substitutes and many other medical specialties, with a view to aiding the army and the navy in the standardization of medical procedures. These special committees were also of service in finding personnel for specific purposes.

Through the committee on information a new publication called *War Medicine* was published in co-operation with the American Medical association. War manuals have been prepared on special aspects of war surgery. The agency was also concerned with the development of the medical history of the war which would cover every possible medical aspect.

The army was aided in the development of a field manual to be used by medical officers, a manual on physical therapy, and special circular letters on venereal disease, inoculation against tropical diseases, tetanus and other conditions.

Other committees made special studies of medical problems in aviation, mechanized warfare, chemical warfare and biologic warfare.

Research.—The board of the special committees of the division of medical sciences of the National Research council co-operates with the Office of Scientific Research and Development (*q.v.*)—the Bush committee—in evaluating problems for scientific medical research in relationship to the war, in developing new problems and in making appropriations for such studies. Special consideration was being given to the problems of aviation, blood distribution and blood substitutes, shock, chemical warfare and anoxaemia.

Office of Defense Health and Welfare.—In this department, under the direction of Paul V. McNutt, there was a co-ordinating committee called Health and Medical committee, under the chairmanship of Dr. Irvin Abell, who was also chairman of the Committee on Medical Preparedness of the American Medical association. This committee included the three surgeons general of the army, navy, and United States Public Health service, Dr. A. N. Richards of the Office of Scientific Research and Development, and Dr. George Baehr of the Office of Civilian Defense. Special subcommittees were concerned with the problems of medical education, hospitalization, nursing and other medical interests. This committee was largely concerned with policies in medical affairs during the war.

Office of Civilian Defense.—The Office of Civilian Defense (*q.v.*) had a special division known as Emergency Medical service, under the direction of Dr. George Baehr. This agency enrolled the services of physicians throughout the United States in meeting any emergency which might be created by the war, including first aid, hospitalization, blood distribution, care of dependent children and mothers, transportation of wounded and many other similar matters. A subagency existed in each one of the army corps areas.

Red Cross.—The medical profession was co-operating with the Red Cross (*q.v.*) in the blood distribution program. The Red Cross assumed the responsibility for the collection of blood and of blood plasma to meet the needs of the army and of the navy. The medical profession co-operated particularly with the Red Cross in all activities of medical character. The medical aspects of the work of the Red Cross were under the direction of Dr. Albert McCown in the Washington headquarters.

Army.—The U.S. army, under the direction of Major General James C. Magee, required from six to seven physicians for every 10,000 men enrolled. At the end of 1941, there were some 14,000 medical officers on active duty, and approximately an equal number in the Medical reserve. It was anticipated that an increase of the army to 4,000,000 men would require at least 28,000 physicians.

Navy.—The navy, under the administration of Rear Admiral Ross T. McIntire, utilized some 5,000 physicians in its work.

United States Public Health Service.—The United States Public Health service expanded greatly to meet war needs, and undertook particularly the prevention of disease in areas surrounding army camps and large industrial centres. This work was under the direction of Surgeon General Thomas Parran.

Scientific Problems.—Particular interest attached to the increased ability of modern medicine with new drugs to prevent serious infections of war wounds, and to control such conditions as pneumonia. Sickness and death rates in the U.S. army during the period of mobilization were the lowest in any army at any time. The reports of casualties in Hawaii on Dec. 7 indicated that the number of infected wounds was less than in any previous engagement of army and navy personnel in battle. The subsequent mortality from wounds was the lowest ever reached in such incidents. More than 60% of the casualties in the navy were due to burns. In the treatment of burns, the use of blood plasma to prevent shock and of the sulphonamide derivatives to prevent infection greatly improved the treatment, shortened the duration of illness and prevented mortality.

All American soldiers and sailors were inoculated against typhoid fever, smallpox and tetanus. Sailors going into tropical areas had the benefit of inoculation against typhus, cholera and plague.

Nutrition.—In the army, standard diets were calculated according to the best modern knowledge of nutrition, so that the food supplied to the army was well above that of any other nation in the world.

Socialization of Medicine.—Concentration by federal agencies on health in the national emergency seemed to bring about a lull in activities related to socialization of medicine. In the meantime, more than 14 states, through their state medical societies, developed mutual plans for extending medical service to large numbers of workers, the outstanding plans being those of the Michigan State Medical society and of the California State Medical society. Under the Michigan plan almost 400,000 workers had voluntary hospital insurance through their industry, and also 100,000 were covered by insurance against surgical fees. A small number of workers seemed to be interested in insurance against ordinary medical fees. The Farm Security administration provided a system of insurance against medical costs for some 105,000 farmers and their families throughout the United States. This system was developed by co-operation between the Farm Security administration and the county medical societies in various parts of the country. In his message to the congress, President Roosevelt recommended expansion of the Social Security law to provide compensation for workers disabled in industry, with a view also to getting hospitalization and care.

Private insurance agencies throughout the United States extended insurance against the costs of hospitalization, surgical fees and medical care, so that many hundreds of thousands of workers in major industries were covered by such insurance. In most cases the cost was divided between the worker himself and the industry which employed him.

THIS 18-MONTH-OLD LONDON BOY had 60% of his body covered with second- and third-degree burns after a German raid of April 1941. Though a 30% burn is usually fatal, he was revived with saline solutions, then placed in a tub of salt water kept at constant temperature. In June he was able to stand in his bassinet

Mediterranean, British Possessions in: *see* BRITISH POSSESSIONS IN THE MEDITERRANEAN.

Meighen, Arthur (1874–), Canadian politician, was born June 16, at Anderson, Ont. Raised on a farm, he was educated at St. Mary's Collegiate institute and at the University of Toronto. After teaching in Collegiate institute, Caledonia, Ont., and in Winnipeg, he was called to the bar

at Winnipeg in 1903. He then practised law at Portage la Prairie, Manitoba.

Meighen was elected to the Canadian house of commons in 1908, and was re-elected in 1911, 1913 and 1917. He was solicitor general, 1913; secretary of state for Canada, 1915–17; minister of interior and superintendent general of Indian affairs, 1917. He went to England with the prime minister, Sir Robert Borden, to attend the Imperial Conference of 1918. Meighen was premier of Canada from July 1920 to Dec. 1921, and again July–Sept. 1926, till defeated in a general election; he was also minister without portfolio in the Bennett cabinet (Feb. 1932). He was chosen as leader of the senate in 1932, and was selected to lead the Conservative party in 1941.

Mellon Art Gallery: *see* SMITHSONIAN INSTITUTION.

Menocal y Deop, Mario Garcia (1866–1941), Cuban politician, was born Dec. 16 in Matanzas province, the son of a wealthy sugar planter who fled to the United States during the Cuban revolution, 1868–78. Menocal, who was graduated from the engineering school at Cornell university, returned to Cuba in 1891. He joined a Cuban army of rebels, fought in the war of independence, 1898, and won renown as a military strategist. He rose swiftly in politics and was elected president of the island republic in 1912 and was re-elected in 1916. But charges of maladministration persisted through both of his terms (1913–21), and the man hailed as a liberator in 1912 was regarded with suspicion in the early twenties. He remained a power in Cuban politics, however, until Machado assumed office in 1925. Menocal was twice imprisoned and finally fled to Miami, Fla.

He returned to Havana and was again engaged in politics when he died in the Cuban capital, Sept. 7.

Menzies, Robert Gordon (1894–), Australian statesman, born Dec. 20 and educated at Grenville college, Ballarat, at Wesley college, Melbourne, and at Melbourne university. He practised law in Victoria and entered the Victorian legislative council in 1928, and the provincial assembly the following year. From 1932 to 1934 he was attorney-general and minister for railways in the cabinet of Victorian Premier Argyle, and for a short time in 1934 was acting premier. In that year he was appointed attorney-general and minister for industry in the dominion cabinet of Joseph A. Lyons. Upon Lyons' death in 1939, Menzies was elected to succeed him as leader of the United Australia party and received his commission to form a cabinet. Immediately upon the outbreak of war Sept. 3, 1939, Menzies' cabinet approved a declaration of war against Germany. The following month he re-introduced compulsory military training in Australia. On March 14, 1940, he reformed his cabinet along coalition lines to include three members of the Country party.

Menzies left Australia in Jan. 1941 for a series of conferences in London. Early in February he visited Australian forces in North Africa. In London for two months thereafter, he conferred frequently with Winston Churchill and members of the war cabinet on Australia's part in the war; he also paid a visit to Eamon de Valera in Eire. He returned to Melbourne May 31 to face a growing opposition in parliament which was due partly to the Libyan, Greek and Cretan defeats, and partly to the Labour party's insistence that the prime minister should remain in Australia and not return to London.

Menzies resigned Aug. 28 and was succeeded by Arthur Fadden (*q.v.*), in whose cabinet he remained as minister of defense coordination.

Mercury. Production of mercury in the United States in 1940 reached the highest level since 1883, with 37,777 flasks of 76 lb. each, or 1,302 metric tons. The monthly output had been more than doubled during the course of the year, and the output was sufficient to meet all domestic demands, supply net exports of 9,446 flasks and add 1,731 flasks to stocks. There were no imports after April, and the total for the year was only 171 flasks, against exports of 9,617 flasks. Production rose from 3,100 flasks in Jan. 1941 to 4,211 flasks in September, and the total for the nine months was 32,200 flasks, 21% more than the same period of 1940. The total for the year was expected to come close to 45,000 flasks. Imports during this period were comparatively small but had increased over those of 1940; 104 flasks of Spanish mercury appeared in March and April, probably from bond, rather than by direct importation, and in August 500 flasks were received from Canada, followed by 75 more in September, and 200 flasks from Mexico. Exports during 1941 were much less, being 1,560 flasks to the end of September. Consumption during the first three quarters of 1941 was 32,200 flasks, 70% more than the same period of 1940, and was expected to reach 43,000 flasks for the year. Stocks at the end of Jan. 1941 had reached 14,512 flasks, but had dropped to 12,716 flasks at the end of September.

In June 1940 the price of mercury was at a high of $208–$212 per flask, dropping to $164–$166 at the end of the year; there was a gradual recovery in 1941, to $197–$199 in November, in spite of a warning issued in March that the government considered the $180 current at that time to be higher than was warranted by existing conditions or future prospects.

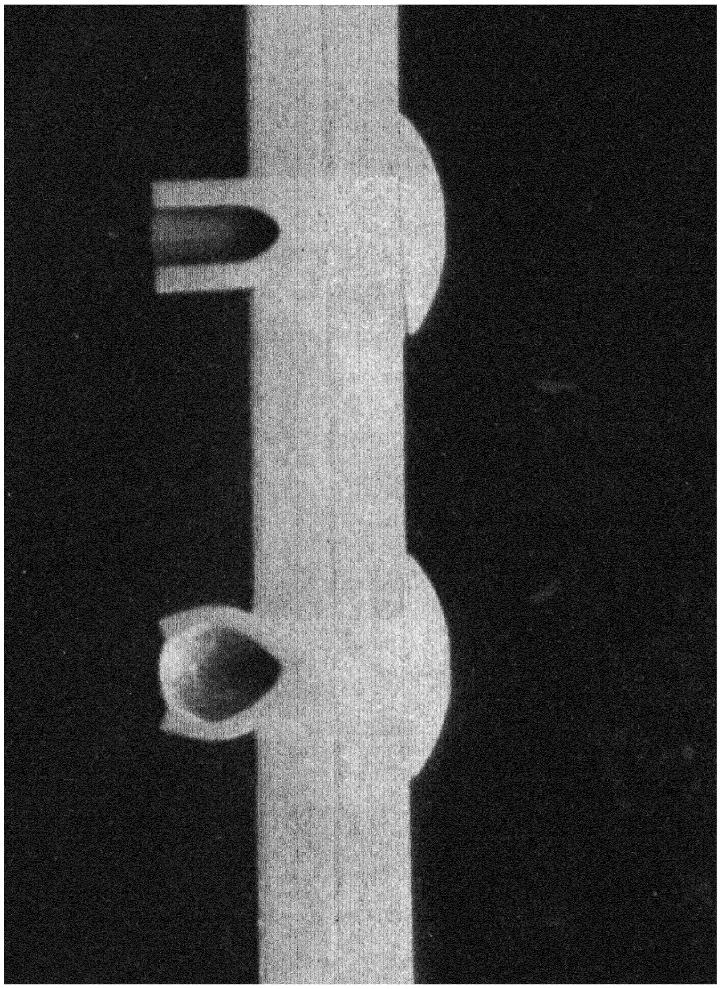
Mexican production had increased to 593,343 kg. (17,198 flasks) to the end of July 1941, as compared with 185,265 kg. (5,370 flasks) in the same period of 1940, and 401,700 kg. (11,653 flasks) for the year. Although in the past Mexico had been the only other North American producer, Canada entered the list with a small experimental output in 1939, and in June 1940 started a new plant treating 50 tons of ore daily from a deposit at Pinchi lake, B.C. Late in 1941 the addition of 250 tons capacity to this plant was announced, and while no reports have been made on output, judging from such data as have been published, this should give Canada an output of something like 30,000 flasks a year. (G. A. Ro.)

Merezhkovsky, Dmitri Sergeievich (1865 – 1941), Russian novelist and critic, was born Aug. 2 in St. Petersburg (Leningrad). Among his later books were *The Romance of Leonardo da Vinci* (1931) and two volumes on Christ, *Jesus the Unknown* (1934) and *Jesus Manifest* (1936). His death in Paris was revealed in a Vichy dispatch dated Dec. 9. (See *Encyclopædia Britannica.*)

Metallurgy. Heavy demand for all kinds of metals, and shortage in the supply of most of them, resulted in many new developments to speed up production, save time and material in fabrication, and make use of substitutes wherever possible. With the still greater demand that would result from the active entry of the United States into the war, 1942 was expected to see even greater extensions of the type of progress that had been made in 1941, as indicated in the following brief notations on some of the high lights of the year's progress.

Die Castings.—Die-casting machines were growing in size and weight, and were being made with interchangeable pots and plungers, so that the machine might be adaptable to more than one type of alloy.

Explosive Rivets.—One of the most interesting of the new metallurgical developments was the use in aircraft construction of a rivet with a hollow end, in which is embedded a small charge of explosive. These are used at points where the under side of the work is inaccessible for heading in the usual way, the operation being accomplished by the application of heat to the head of the rivet; when the explosive is set off by the heat, the end is



EXPLOSIVE RIVETS, perfected in 1941, are set with greater speed and ease than is possible by mechanical means. An explosive placed in a cavity at the end of the shank is detonated by the heat of an electric gun applied to the rivet head. The explosion expands the cavity and forms a "blind" head which sets the rivet. The photograph shows the rivet before and after setting

expanded and the rivet is set in place.

Flame Cutting.—The old established methods of flame cutting, using an oxyacetylene torch, were adapted to shape a rough form from a steel bloom, to replace a casting.

Inclusions.—A scheme for the classification and identification of inclusions in cast iron and steel was reported to the British Iron and Steel institute by Marrogh.

Powder Metallurgy.—The new applications of powder metallurgy were relieving the load on the die-casting industry, and at the same time were expected to play a part in the solution of many problems involving compounding as well as forming, as applied to war production.

Superfinish.—To what extent the aeroplane industry would be able to make use of the developments made in superfinishing by the automobile industry was a matter of speculation.

Surface Hardening.—This new type of localized hardening, making use of either flame or electrical heating, was expected to save time in certain types of war work, as a substitute for case hardening or nitriding.

Testing Methods.—The X-ray, radiography, magnetic and photoelastic methods, and measurement of hardenability and machinability were among the newer testing processes which were finding new fields of use and broader application.

Ultrasonics.—There were on the market in 1941 generators of ultrasonic waves, that is, sound waves above the hearing limit of the human ear, and several new applications were being tried out in the testing of metals for flaws, cracks, inclusions and voids; another angle that showed promise was in the better dispersion of liquid alloys and of metal powders, and there were indications that these waves might help in the degasifying of metals and in the penetration of the hardening agent in surface hardening processes.

Bismuth.—The machinability of stainless steel might be improved by small additions of bismuth, but at the loss of some part of the impact value, tensile strength and elongation.

Cobalt.—Belgian Congo cobalt residues were being smelted at Niagara Falls, along with ores from Canada.

Magnesium.—The heavy demand for new plant capacity for magnesium called for new sources of raw materials, which would include not only the former magnesium chloride, but also magnesite, and magnesia dolomite, recovered from sea water. Tests were to be made with bruceite.

Manganese.—Progress was being made with processes for the recovery of manganese from low-grade ores.

Sodium.—Metallic sodium was being used as a coolant for the valve stems of aeroplane engines, the metal being placed in a hollow stem, so that when melted by the heat, it could by convection and conduction carry the head away from the head of the valve to the base of the stem, where it can be absorbed in the cooling jacket.

Stainless Steels.—Excessive demand for aircraft was expected to lead to the use of stainless steel parts, due partly to the shortage of aluminum and partly to better resistance of steel to high temperatures and abrasion.

Tin.—There were seven small tin smelters in operation in the United States in 1940, and in 1941 a plant with a capacity of 18,000 tons of metal a year was being built near Galveston, Texas, the ore supply having been contracted for in Bolivia. The developments of the year-end in Malaya and Netherlands East Indies would probably lead to an extension of these activities. (*See* also articles on individual minerals.) (G. A. Ro.)

Metal Prices and Production: *see* MINERAL AND METAL PRICES AND PRODUCTION.

Metaxas, John (1871–1941), premier and dictator of Greece from 1936 until his death, was born April 12 on the island of Ithaca. He attended military schools in Greece and Germany and served as commissioned officer in both the Graeco-Turkish War in 1897 and the Balkan Wars, 1912–13. His ability in directing field operations in the latter conflict earned him the post of chief of general staff in 1915, and he became King Constantine's closest military adviser during the war of 1914–18. Twice exiled from Greece, once for plotting an unsuccessful monarchist revolt, Metaxas returned to his country's good graces and in 1926 was given the post of minister of communications in the newly created Greek republic. He was appointed minister of state in 1935 and a year later became premier. Once established in the premiership, Metaxas showed his scorn for democratic procedure. One of his first acts was to abolish parliament and all political parties. He declared martial law to quell a general strike, and with the consent of King George II he proclaimed himself chief of state and ruled Greece with an iron hand. Following the fascist pattern of one-man government, he organized a secret police system, established a youth movement, assumed control over labour unions and advocated a Spartan life for modern-day Greeks. He also took over the portfolios of war, navy, air, foreign affairs and cults and national education. Metaxas again displayed keen military judgment when Italian armies attacked Greece in Oct. 1940, and was credited with the Greek successes against the invaders in the ensuing campaigns in Albania. He died at his suburban home near Athens, Jan. 29.

Meteorology. An outstanding development in meteorology during 1941 was the large-scale adaptation of its uses to military purposes. While the importance of weather in war has long been obvious, the comparatively short time-range in forecasting had heretofore limited its military usefulness to the planning of actions (such as gas attacks, aerial reconnaissance and adjustments of artillery ranges) that could be executed on short notice. With the rapidity of modern military operations and the corresponding time-extension of weather forecasts, however, the two were brought together and the usefulness of the latter decidedly increased—particularly in the prediction of fog, winds and clouds for naval and large-scale aerial activities and of conditions that might affect short-period land actions and communications.

In the United States, where military uses of weather information in World War II had been watched closely since its beginning, the start of hostilities in December found the weather bureau and the meteorological branches of the army and navy already co-operating closely and prepared to put the national meteorological service on a war footing at once. The control of Canadian and marine reports was extended to a complete shutdown of radio broadcasting of synoptic data. The special forecasting services for Great Lakes shipping, construction of plants, regulation of manoeuvres, scheduling of aviation practice and transport of bomber fleets were raised to a level of first-priority importance. Improvements in the meteorological services of Alaska and the Caribbean sea, already well advanced as a preparatory defense measure, were accelerated. And studies of climatological data, already providing helpful guidance in the location

of camps and factories, the orientation of airport runways, the determination of efficient flying levels and the scheduling of long-range activities of various kinds, were extended at once to include climatic surveys of foreign areas of likely operation by American military forces.

Notable improvements in American meteorological practice resulted from the perfection of the radiosonde and the adoption of the air-mass system of forecasting. In a broad sense these two contributions might be considered interdependent—at least to the extent that air-mass forecasting on an areal scale as great as that of the United States could scarcely succeed without the current records obtained by radiosonde of upper air conditions and movements. At the close of 1941, twice-daily flights of this instrument, reporting humidity, temperature and atmospheric pressure through vertical heights of the order of 12 mi., were being recorded at 40 stations in the United States and its possessions. These data, representing an accurate cross-sectional measurement of atmospheric conditions and circulatory actions aloft, constituted an invaluable aid in the analysis of the three-dimensional charts upon which modern forecasting is based.

With this and other refinements in basic observational procedures combined with an enlarged use of teletype and radio in communications, the range and usefulness of applied meteorology broadened considerably. Engineering, transportation and industry particularly found uses for this service of hitherto unrealized value; and the same was true to a somewhat smaller extent in the fields of advertising, public health, agriculture, construction and chemical manufacture. It was notable that the bulk of unsatisfied demands, from a wide range large-scale human activity, reflected no lack in either the accuracy or the content of weather forecasts, but rather called insistently for extension

of the time-period covered by them. The five-day forecasts inaugurated in late 1940 in the United States met some of these demands satisfactorily; but to a very large extent the problem of long range forecasting for periods exceeding five days was still unsolved.

The beginning of hostilities in Dec. 1941 produced an almost immediate curtailment in the issue and publication of official weather information. This curtailment, shaped to the double purpose of withholding information from the enemy and at the same time continuing essential service to civilian interests, necessarily imposed a considerable inconvenience upon many lines of activity, a number of which were directly connected with the production of war materials and the conduct of other defense work. At the close of the year, under the president's stipulation requiring the control of information by means of "voluntary censorship," the office of censorship and the weather bureau were formulating a plan of press publication for weather information expected to meet all essential civilian as well as military requirements.

Weather of 1941 in the United States.—In the United States the weather during 1941 was decidedly abnormal in several respects. Following the general trend since the turn of the century, the year was warmer than normal practically everywhere. Rainfall was unusually heavy over the western two-thirds of the country and was decidedly scanty in a central-eastern area. There was less sunshine than normal in the central valleys and generally in the south and more western states, but there was more than the usual amount from the middle Atlantic area northward and in the northwest. The year was outstandingly cloudy in the Gulf area.

Temperature.—The tendency for above-normal warmth was present in all seasons of the year. The average winter temperature was above normal everywhere except in parts of the Atlantic area. The spring, March–May, had slightly below-normal temperatures in the south and some eastern sections, but it was substantially warmer than normal throughout the northern half of the country, the plus departures ranging from 3° to 5° in most sections. The summer was somewhat cooler than normal in the southwest and parts of the Great Basin, but elsewhere it was warmer than normal, with the greatest plus departures in the same area as for the spring. The fall season, September–November, was relatively cool west of the Rocky mountains, but elsewhere temperatures averaged considerably above normal.

In January the lowest temperature recorded was —43° at Taylor Park, Colo., and in Alaska —65° at Fort Yukon. In February the lowest in the states was —40° at Edmore, N.D., and in Alaska —42° at Fort Yukon. The highest for the year was 124° in Death Valley, Calif. For the year as a whole the temperature averaged above normal in practically all parts of the country, with the largest plus anomalies, 2° to nearly 5°, in north central states from the Ohio and middle Mississippi valleys northward and northwestward.

Precipitation.—While both the spring and the fall were abnormally dry in the eastern states, for the country as a whole 1941 was one of the wettest years of record, the last half being especially wet nearly everywhere west of the Mississippi river. Louisiana, with a state average rainfall of 60.5 in., was the wettest state, and Nevada, with 13.8, the driest. An outstanding feature of the year's rainfall was the reversal of usual conditions as reflected in the heavy rains in western states and relatively light amounts in the east. The southwest was especially wet, with five states having more than 150% of normal annual precipitation, while west of the Mississippi river only Arkansas and Washington had deficiencies and these were small. On the other hand, the middle Atlantic states, led by Virginia, were abnormally dry.

It was the wettest year of record in North Dakota, Utah and New Mexico, the last named having had more than a third more precipitation than had occurred in any previous year of record. It was the second wettest year of record in Nevada, Arizona, Texas, Oklahoma and Kansas, and the third wettest in California. On the other hand, several of the more eastern states had far below normal. Tennessee had the driest year of record, Kentucky, Virginia and Maryland the second driest and North Carolina the third.

For the U.S. as a whole the average annual precipitation was 32.36 in., or nearly 12% above normal; there were only two wetter years of record in the climatological history of the country. It is noteworthy, for example, that Kansas, in the area where severe drought prevailed during the 1930 decade, had more rainfall in 1941 than either of the Virginias, Maryland, Ohio, Indiana, Kentucky and even Tennessee. Rainfall in these states is normally much heavier than in Kansas.

Floods.—Excessive rains in several areas, especially in June and July, resulted in heavy flood damage. In the Sacramento valley of California floods occurred in February, March and April, with a total property loss of more than $1,000,000, and losses in Missouri and Arkansas in April amounted to more than $1,500,000. The most damaging floods of the year occurred in June and July in the Missouri, Ohio, Arkansas and Red river basins, and in July in the rivers of western Texas, resulting in a total of some $12,000,000 damage. (*See* also FLOODS AND FLOOD CONTROL.)

Destructive Storms.—Noteworthy destructive hailstorms occurred in Rooks county, Kan., on June 15, damage $172,000; in several Iowa counties on the same day, damage $143,000; in Calhoun county, Ia., July 10, damage $150,000; several counties of central and southwestern Minnesota July 17, damage $767,000; Fergus county, Mont., July 18, damage $250,000; in the vicinity of Blanca, Colo., Aug. 20, damage $600,000; and at Sugar City, Colo., on the same day, damage $100,000.

An outstandingly destructive storm, remarkable for suddenness and severity, swept into the northern Great Plains from the adjoining Canadian provinces on March 15. It was the most severe storm of record in the Red river valley of the north and some adjacent sections, when the wind of moderate velocity from the southwest suddenly shifted to the northwest with very high velocities, attended by drifting snow. The temperature dropped from around the freezing point in the early evening of the 15th to considerably below zero by the following morning. Many motorists were caught on the highways, unprepared, and found it impossible to proceed with the blinding snow driven by winds of gale force, reaching 60 to 70 m.p.h. About 60 people lost their lives in North Dakota and Minnesota, with heavy property loss. (*See* also DISASTERS: *Natural Disasters.*)

(F. W. RR.)

Other Countries.—The values for monthly rainfall and monthly mean temperatures given in the accompanying tables referring to countries outside the United States are provisional and may in some cases require a small correction. On account of war conditions it has not been possible to give complete data for some of the stations. Gaps in the tables indicate that the data could not be obtained. (D. BRU.)

Methodist Church. Membership figures for the Methodist Church, as of July 1, 1941, were as follows: Members in the United States, 6,993,975; in other lands, 354,770. The large apparent decrease was due to the discontinuance of the practice of counting "inactive members" in the total. There were 23,924 ministers in the U.S. and 2,211 elsewhere. Sunday school enrolment was 5,152,887 in the U.S. and 314,701 in other countries.

The collection on "Compassion Sunday," March 2 (and after), produced $957,000 up to Dec. 1. The collection was being divided between the service of soldiers and sailors, relief of British Methodists and for war sufferers generally. In addition, the Commission on Overseas Relief raised more than $200,000, much of which was sent to China.

The central conferences elected bishops as follows: Germany, F. H. Otto Melle (re-elected); southern Asia, Shot K. Mondol and Clement D. Rockey; China elected Carleton Lacy, Z. T. Kaung and W. Y. Chen. Bishop John Gowdy retired. Latin America elected Enrique Balloch in place of Bishop Roberto Elphick, retired.

The Methodist Publishing house closed its printing plant near New York city on July 1 to concentrate the manufacture of books and periodicals in Nashville, Tenn., Cincinnati, O. and Chicago, Ill. The Methodist building in New York city was remodelled at a cost of $250,000 and a new building for the publishing house in Nashville, Tenn., was authorized. The house had the most profitable year since 1929, and distributed to the retired preachers a dividend of $200,000. In place of the 55 Sunday school periodicals formerly issued by the three churches, the publishing house issued, beginning Oct. 1, a carefully graded series of 25 periodicals, which started off with a circulation of 4,400,000. The *Christian Advocate*, the one official weekly, issued at Chicago, Ill., Dr. Roy L. Smith editor, maintained a circulation exceeding 260,000.

The churches contributed $4,166,262 to the World Service and General

Administration fund in the fiscal year ending May 31, 1941, a decrease of 3.12%. Receipts of the Episcopal fund (for maintenance of the episcopacy) were $631,650 and disbursements, $412,721. The General Administration fund received $125,999 and disbursed $99,095.

The war disrupted Methodist foreign missions to an unprecedented degree. Communication with the workers in most of the European countries occupied by the nazis was cut off, and some of the missionaries interned. Germany and Czechoslovakia were notable exceptions. The Finnish Methodists especially suffered severe privations. In Japan the government forced the denominational groups into a united Church of Christ in Japan. Most, if not all, of the Methodist missionaries in Japan, Korea and occupied China were withdrawn, some of them finding work in India and the Philippines. West China, Chiang Kai-shek's domain, was urging that more young workers be sent. Bishop Lee in Malaya reported great ingatherings. The same was true of the Philippines. The total receipts of the division of foreign missions from Jan. 1 to May 31, 1941, were $987,585. The total giving of the Methodist church for all purposes in the year ending May 31, 1941, was $90,323,961, of which $7,950,303 were for missionary, philanthropic and educational purposes.

In Chicago, in November, the new 22-story building of the Wesley hospital was dedicated. It adjoins the downtown campus of Northwestern university medical school. The Methodist hospital in Brooklyn, N.Y., on Dec. 4 laid the cornerstone of Buckley pavilion (surgery), to cost $1,125,000.

Very large gifts to Methodist education, missions and philanthropy were made in 1941 by Mrs. Sterling Morton of Chicago, Ill., Mrs. Henry Pfeiffer of New York, N.Y. and the Collins family of Portland, Ore.

A gathering at Baker university, Baldwin, Kan., in August formed the Methodist Youth Fellowship, an organization which replaced the Epworth League and other existing young peoples' societies of the three churches. Kempton Jones of Salisbury, N.C., a student in Duke university, was elected president and Harvey Seiffert of Nashville, Tenn., secretary. It is claimed that 2,000,000 Methodist young people are eligible to membership. Departments were provided for worship and evangelism, world friendship, community service, recreation and pleasure. Nashville, Tenn. was designated as the central office.

The council of bishops in December in their statement on the war which Japan had launched said: "Our duty as American citizens is clear. The enemy leaves us no alternative. In answer to the challenge of international immorality our president has avowed for himself and for our people the determination that the forces of brutality and treachery must be permanently broken. In this crisis, as in all previous crises in our history, the Methodists of America will loyally support the president and the nation."

It was reported that the Methodists rank next below the Quakers and Mennonites in numbers in the camps of conscientious objectors. Pacifist teaching was emphasized by prominent Methodist preachers and in statements by the Commission on World Peace. One much publicized case was that of one H. W. Kuhns, a Methodist youth of high reputation in Redlands, Calif. On his refusal on conscientious grounds to be inducted into the army, he was sentenced to two years in jail. Bishop Baker and leading Methodist officials expressed the belief that the conviction was a miscarriage of justice. The district attorney thereupon announced an investigation to ascertain whether the churchmen had not been guilty in the affair. But before he could start operations, Washington became aware of the case and an order from Attorney General Biddle arrested his action.

Great Britain.—War conditions led to the Methodist conference meeting in Leeds instead of London as appointed in 1940. So thin was the attendance that it was called a "shadow conference," and it completed its business in four days. The officers were Rev. W. H. Armstrong, president; Lord Rochester, vice-president and Edwin Finch, secretary. Officers elected for 1942–43 were Rev. W. J. Noble, president; Herbert Ibberson, vice-president and the secretary re-elected. Proposed amendments to the Deed of Union were adopted. One reduced the size of the conference; the other, which conferred unprecedented powers of appointment on the president, was strongly opposed. A declaration of support for the government in the war was carried by 131 votes against 16, with 9 not voting. Rev. Henry Carter made the pacifist protest against war and Dr. Scott Lidgett supported the action. The total membership reported was 770,653. The conference heard with regret that the decline in membership, which has cost the Methodist Church 90,000 members since the union (1932), had continued, the net loss in the year 1941 being 13,482, with only 2 out of the 46 districts reporting an increase. The collections for missions and other connectional purposes were being well maintained. War activities included 180 army and navy chaplaincies and more than 500 canteens. Methodist women knitted more than nine tons of "woollies" for the men in the service. Bombing raids damaged 1,500 church properties, 400 of them so that they cannot be used. Several central halls, including Manchester, were totally demolished. The church co-operated with the government in handling the damage problem. The War Emergency fund reached a total of £116,996, much of which was contributed locally, with large contributions from Methodists in the colonies and largest of all from the United States. (J. R. J.)

Mexico. A federal republic, between the United States and Central America and bordering the Pacific and Atlantic (Gulf of Mexico). Area, 767,168 sq.mi.; pop. (1940 preliminary census report) 19,546,135. Capital: Mexico City (1,451,616). Other principal cities: Guadalajara (220,049); Monterrey (180,942); Puebla (137,324); Mérida (98,334); León (86,089); Tampico (81,334); Aguascalientes (81,124); San Luis Potosí (78,042); Torreón (76,613); Veracruz (74,541); Chihuahua (57,456); Pachuca (52,387). About 55% of the population was mestizo, 29% Indian, 15% white. Foreigners constituted less than 1%. About 14% speak only Indian tongues. Religion: Roman Catholic. Mexico includes 28 states, each with its own governor and legislature and a limited autonomy, and three territories and a federal district, with governors appointed by the president. The national government is administered by a president elected for six years, and a bicameral congress. The 170 members of the chamber of deputies are elected for three years and the 58 senators for six years, by universal suffrage. President in 1941: General Manuel Avila Camacho (*q.v.*).

History.—In 1941, developments in Mexico were strongly influenced by affairs abroad. Politically, the country was quiet, but economic expansion was limited by external conditions resulting from the war. Mexico continued to tie her destiny with that of the other American republics, especially the United States, by economic and diplomatic bonds, but remained technically at peace.

Throughout the year Mexico was beset with the problem of maintaining her neutrality in World War II and her part in the defense of the hemisphere without sacrificing internal political and economic freedom. The situation was met with a program of close collaboration with the United States in everything short of war.

In the first few months of 1941, a naval and air base on the Pacific was planned, with La Paz, Baja (Lower) California, as the site; the cancelled Japanese fishing rights on the west coast were denied renewal; the Spanish fascist Falange organization was subjected to close government scrutiny; and two German ships with 269 officers and men and 10 Italian vessels with crews numbering 291 were interned in Mexican ports.

In August, 13 army officers were assigned to United States posts to study modern military methods, and reconstruction was begun on the antiquated 190-mi. Isthmus of Tehuantepec railroad, an alternate route to the Panama Canal. In September Mexico obtained credits for the purchase of 160 military planes from the United States. Shipment of vital war materials to non-American countries was banned in July. Close scrutiny of exports was ordered in October after the discovery of large quantities of contraband mercury ready for shipment on a Japanese steamer at Manzanillo.

When the United States entered the war, Mexico took further strong steps toward hemispheric defense. On Dec. 10, all Japanese funds were frozen; former President Gen. Lázaro Cárdenas was appointed to command all land, sea and air forces on the Pacific coast; and troops, gunboats and planes were rushed to that sector, two battalions crossing through United States territory into Baja California. United States and Mexican air forces co-operated in patrolling the west coast from the border of the two countries to the Panama Canal, and four Japanese fishing boats were seized off Baja California Dec. 12 and Dec. 19. Plans to fortify the west coast harbours of Mazatlán, Manzanillo and Magdalena bay went into formative stages Dec. 15, and a bill according nonbelligerent status to any American nation at war with a non-American country was passed unanimously by the senate Dec. 24, permitting troops, warships and planes of such American governments to use Mexican territory, waters and ports. On Dec. 27, Pres. Avila Camacho sent a bill to congress to broaden and strengthen the powers of judicial agencies dealing with espionage and sabotage. Telephone communication with the strategically located María Madre and Tres Marías islands in the Pacific and with Mazatlán and Mexicali on the west coast was opened in the interests of national defense.

Meanwhile, popular support of the president's co-operation with the United States in the war against the axis was manifested on Dec. 14, when 30,000 workers staged a demonstration in the capital applauding the administration's anti-axis policies. The next day groups of teachers and university students announced cessa-

tion of all anti-United States activities and wholehearted support of the government's stand. Although Mexico failed to declare war by the year's end, it had firmly embarked on a policy of close co-operation with the United States in the role of an arsenal for the democracies, especially in supplying food and strategic materials.

The year's political trend followed the program outlined by Pres. Avila Camacho in his inaugural address in 1940. Instead of a definite swing to the right, as many expected, the new administration policy was rather to slow the pace of Mexico's second six-year plan and to consolidate gains already made. In keeping with this policy was the administration's political toleration and delicate balancing of the political scales between left and right, which made 1941 stand out as a year of striking internal tranquility. Tomás Garrido Canabal, violently antichurch former governor of Tabasco, and Gen. Plutarco Elías Calles, former president and long-time political boss of Mexico, who had been exiled by the Cárdenas administration in 1935 and 1936 respectively, were permitted to return to Mexico. Later in the year cabinet changes replaced two leftist members with more moderate ministers, one of them the president's brother, Maximino Avila Camacho, a close associate of the rightist wing of the administration. But the appointment of Gen. Cárdenas, actual leader of the left wing, to high military command (*see* above) was regarded as counterbalancing any political effects.

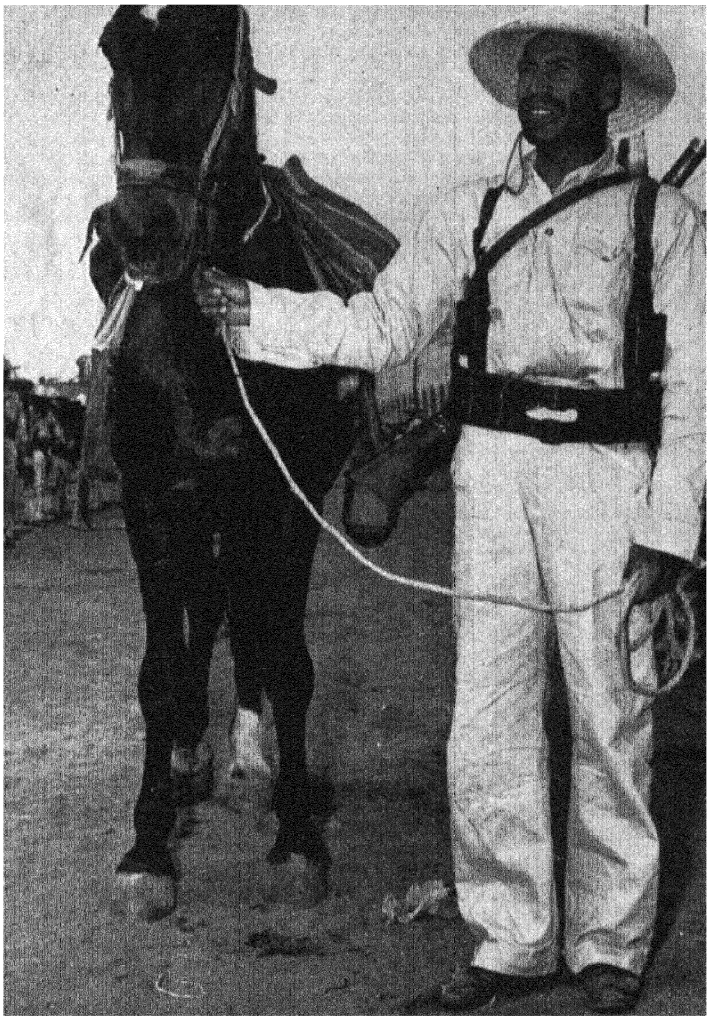
Administration control over organized labour as a political force seemed assured in February when Vicente Lombardo Toledano, intransigent radical political boss of the powerful Confederation of Mexican Workers, formally relinquished his office of secretary-general and was replaced by a more moderate leader —Fidel Velásquez. In November, however, Toledano was re-elected president of the international Confederation of Latin American Workers at its congress in Mexico City, and he remained a potent force in the labour movement. Meanwhile, in March, Velásquez, affirming a policy established in 1940, issued a stirring manifesto which strongly condemned the axis powers in Europe and aligned Mexican labour with the democracies.

The only serious threat to Mexico's political unity was made by the Sinarquista party, a pro-fascist rightist group strongly organized among remnants of the church party and large and small landowners. A plan to colonize scantily populated Baja California with Sinarquistas, including many Spaniards, was unanimously opposed by the chamber of deputies in October, but Pres. Avila Camacho authorized the settlement with the reservation that not more than a third of the colonists be Sinarquistas, and the senate approved the measure. The administration's political trend was well indicated in the year's economic developments. Strikes continued to hamper industry, with no more restriction than a six-day "cooling off" period required by law.

The land redistribution program slackened in 1941, but the principle of collectivization continued in force. Although newly distributed plots were given in private ownership, their alienation in any way was prohibited, and failure to utilize them for two years meant loss of rights to them. The large ejidal, or collectivized districts of La Laguna, Los Mochis and the Yaqui valley were specifically exempted from subdivision into private plots. During the year ending Aug. 31, 1941, 2,075,535 ac. were distributed among 36,340 persons.

In March the National railways, reorganized under a board of labour and government representatives, began paying monthly instalments of 1,200,000 pesos on its accumulated deficit of some 13,000,000 pesos. Six modern locomotives were purchased from the United States in August. In November the government made $40,000,000 available for urgent improvements, including the purchase of more rolling stock.

The oil industry, operating at an accumulated loss of about



IRREGULAR of the Mexican army participating in manoeuvres at Puebla in 1941. There were more than 250,000 of these "agraristas" in Mexico in 1941

$20,000,000 since nationalization in 1938, suffered seriously in 1941 because of further wartime loss of markets and a $130,000 fire at the huge Minatitlán refinery in October which threatened to halt lubricating oil production for six months. The shortage of transport facilities was aggravated in April, Italy seized three tankers being built for Mexico in Genoa, but this was offset by the expropriation of axis tankers by Mexico. Five of these were put into Mexican service in June, and three more were scheduled for operation. In October, the petroleum administration moved to barter $18,000,000 in crude oil for United States oil-extracting and refinery equipment. The cost of re-equipping the industry was estimated, in December, at $15,000,000. Production and especially exports of petroleum fell off considerably during the year. In November, however, the controversy with United States companies whose properties were expropriated in 1938, and whose subsequent pressure on the Mexican industry had reduced its markets, reached a quasi settlement through diplomatic channels.

The mining industry, except for a boom in mercury, was not appreciably aided by war demands abroad, but agreements with the United States for the purchase of all surpluses of strategic minerals and of 6,000,000 oz. of silver monthly at 35 cents an ounce, heartened this branch of Mexican economy.

The financial situation was aided by the repatriation of some 200,000,000 pesos during the first four months of the new administration, but this trend diminished in the spring when it became apparent that the president would not swing sharply to the right. Bank deposits continued to increase until December, when some 2,000,000 pesos of axis funds in Mexico were frozen. Spanish and French residents, the largest and richest foreign group in Mexico, created a run on the banks, leading to the withdrawal of about $6,000,000. An agreement with the United States

in November for a $40,000,000 loan to stabilize the peso, however, strengthened the financial structure immeasurably.

Mexican industry dependent upon United States shipments of machinery suffered acute shortages because of U.S. priority restrictions, but actual closing of plants was avoided. In December shortages of such vital materials as tin-plate, aluminum, iron, steel and wool resulted in export control of those commodities. Previously Mexico had exported iron ore to Canada on an unprecedented scale. The volume of production during the first eight months of 1941 was slightly lower than in the same period of 1940. Mining, petroleum and electric power indices (basis: 1929=100) slumped from 82·1 to 81·7, 94·8 to 93·8 and 155·5 to 153·5, respectively.

The cost of living, particularly in the federal district, after rising 57·5% since 1934, continued around that level through Sept. 1941, and then jumped to 76% over the 1934 monthly average.

The tragedy of the year was the earthquake of April 15, which rocked central Mexico from coast to coast. Official estimates revealed 90 dead, 300 wounded and 50,000 homeless as a result. At Colima, worst hit, 90% of the houses were destroyed. Property damage amounted to $2,000,000, of which $800,000 was in Mexico City alone.

Foreign Affairs.—Foreign relations during 1941 were marked by close collaboration with the United States in hemisphere defense, resumption of diplomatic relations with Great Britain, and severance of relations with the axis powers.

A mutual assistance pact with the United States, in March, for reciprocal use of air bases, was followed in July by an agreement under which, for an 18-month period, Mexico prohibited the export of her commodities, directly or indirectly, to nations outside the western hemisphere, in return for which the United States undertook to purchase any resulting surpluses, capped by a comprehensive agreement on Nov. 19 for the settlement of all outstanding United States claims. Under this agreement the United States agreed to buy some $25,000,000 of Mexican silver a year, to make available $40,000,000 for currency stabilization, and to lend $10,000,000 annually for three years for Mexican road building. Mexico, on her part, in 15 annual instalments of $2,500,000, undertook to pay in full claims totalling $40,000,000 by putting up $3,000,000 on account. Within six months each country was to appoint one expert to determine the value of United States-owned oil properties in Mexico, expropriated in 1938. In the event five months of diplomatic negotiations should fail, this portion of the agreement was to be cancelled. Mexico was to pay $9,000,000 on these claims beforehand.

Relations with Great Britain, severed in 1938 during the oil expropriation crisis, were resumed in October, but no steps were taken to settle British claims.

Mexico recalled her minister to Germany for "consultation" in April. He did not return to his post. In June, Mexico officially condemned Germany's invasion of the U.S.S.R. as "one of the most tragic violations of international ethics recorded in history." Following strained relations over German indignation at Mexico's failure to protest against the United States black list of axis firms in Latin America, Mexico, in August, ordered German consulates to close and withdrew her own consuls from German-occupied Europe. Relations with Japan (Dec. 9) and Germany and Italy (Dec. 11) were formally severed, in a gesture of open support of the United States in its war against aggressor states. Similar action was taken against Bulgaria and Hungary on Dec. 23. Mexico did not declare war during the year.

Education.—Public education in Mexico is free, compulsory and completely divorced from religion. In 1941, there were 23,181 primary schools with 46,652 teachers and 2,037,870 students. Secondary school enrolment amounted to about 80,000. There were approximately 100 technical schools, including 30 vocational agricultural schools for Indians, and 91 federal schools for adult education, with 488 teachers and 8,760 students. The enrolment in Mexico's ten universities was approximately 30,000. Illiteracy (50% in 1930) was reduced to 45% in 1940 especially through rural education among the Indian population. Rural education is supported mainly by the federal government, urban instruction by the states and municipalities. In 1941, the federal budget for education was 77,850,000 pesos (1940: 73,800,000).

Defense.—The standing army was unofficially estimated in 1941 at 56,000 officers and men with 150,000 reserves. Plans to increase the reserves to 200,000 by compulsory military training were scheduled to go into effect in Jan. 1942. In 1940, the army had only four small tanks and the air force 90 planes and 700 men, but both were being steadily increased in 1941. Purchase of sea-patrol and fighter planes from the United States, in Nov. 1941, was expected to increase the air force to 300 planes by the end of the year. To defend the 3,000-mi. coast line, the navy had six escort vessels, ten coast guard craft and three patrol boats. Mexico's largest appropriations were for national defense (110,000,000 pesos in 1941; 94,025,000 pesos in 1940).

Finance.—The monetary unit is the peso (value: 20.70 cents U.S. Dec. 31, 1941). In 1941, the federal budget called for approximately 492,000,000 pesos, and receipts in the first half of the year were up some 36,278,000 pesos from estimates. Revenues in 1940 amounted to 515,200,000 pesos; expenditures, 523,700,000 pesos. At the end of 1941, metal reserves totalled 189,733,199 pesos; money in circulation 869,260,288 pesos (Sept. 1940: 618,468,000 pesos); and deposits in 137 banks (127 private, two foreign, and the National Bank of Mexico, with its branches, representing a combined capital of 307,352,000 pesos and resources of 1,816,993,000 pesos) 609,158,000 pesos, of which 523,000,000 were demand deposits. The national gold reserve was $31,000,000 U.S. in 1940. Banking is centralized under the National Bank of Mexico. Deposits in the Bank of Mexico and its associates amounted to 1,503,000,000 pesos in June 1941.

Trade.—Foreign trade in 1940 totalled 1,629,000,000 pesos, up 5.5% from 1939. In 1941, for the first time in the 20th century, imports exceeded exports by the substantial margin of some 120,000,000 pesos during the first eight months, as trade concentrated increasingly with the United States.

Exports in 1940 totalled 960,000,000 pesos (5% over 1939), with mineral products, chiefly silver, gold, lead, zinc, copper and petroleum, comprising approximately 70%. The United States took 89.4%, Japan 2.5% and Italy 2.3%. In the first eight months of 1941, exports dropped more than 35%, mainly because of decreased petroleum shipments to Europe after May 1940, and greatly reduced consignments of gold to the United States in 1941.

Imports in 1940 were 669,000,000 pesos (6.2% above 1939), with automobiles, rayon yarn, machinery and other manufactures the main commodities. The United States supplied 78.8% of the imports in 1940, Great Britain 3.2% and Japan 2.6%. In the first eight months of 1941, imports rose almost 29%.

Communication.—External communications are by steamship service, especially through Veracruz; by three main railways to the United States and one to Guatemala; by increasingly important air service north and south and to the West Indies; and by highway, notably through Nuevo Laredo to the north.

There were 24,363 km. of railway in 1941 (more than 50% government-owned) and approximately 56,000 km. of improved highway (including 7,200 km. paved). Work on the 1,900 km. route from Mexico City to the United States border at Nogales, Arizona, via Guadalajara, and on the southern sector of the Pan-American highway from Mexico City to the Guatemala border continued during 1941. A total of $23,000,000 was allotted for construction in 1942, covered in part by a $10,000,000 credit from the United States. Mexican civil air service carried 86,599 passengers in 1940, 3,460 tons of freight and 271,751 kg. of mail. Mexico had 103 licensed radio stations in 1940.

Agriculture.—Essentially an agricultural country, Mexico in 1941 had 120,417,760 ac. of cultivable land (one-fourth of its total area), but only 30,000,000 ac. were cultivated and only 5,700 ac. of a possible 90,000,000 ac. were under irrigation. Agricultural produce was valued at more than 700,000,000 pesos in 1939.

Principal Agricultural Products of Mexico

Crop	Output, tons (1940)	Area harvested, 1940 hectares (=2.471 ac.)	Value, pesos (1939)
Maize	1,680,503	3,302,181	206,437,000
Wheat	362,986	586,979	71,820,000
Cotton	62,440	249,880	70,467,000
Sugar cane	4,972,849	98,346	48,802,000
Henequen	124,973 (1939)	108,900 (1939)	36,614,000
Beans	96,752	635,447	34,905,000
Bahanas	370,643	34,738	23,105,000
Coffee	52,384	116,152	22,289,000
Alfalfa	1,719,084	40,455	22,037,000
Rice	106,589	52,438	14,061,000
Tomatoes	80,362	20,588	13,008,000
Chick-peas	65,561	99,849	11,025,000

Various fruits are also grown. Grazing lands in Mexico cover an area of 120,500,000 ac., with approximately 30,000,000 head of livestock in 1941, including cattle, horses, mules, donkeys, sheep, goats and pigs. There are 44,000,000 ac. of forests, of which 25,000,000 are estimated to be rich in pine, spruce, cedar, mahogany, rosewood and logwood.

Manufacturing.—In 1940, manufactured products were valued at 1,521,673,537 pesos, with 11,974 industrial establishments capitalized at 872,119,997 pesos. The chief manufactured products, with 1940 values, were as follows: refined petroleum products (243,070,899 pesos), cotton thread and cloth (216,154,000), wheat flour (97,335,000), cigars and cigarettes (71,487,000), iron and steel products (65,507,000), refined sugar (62,694,000), woollen thread and cloth (40,126,000), vegetable oils (38,506,-

000), soap (38,223,000), paper (32,641,000). The index of industrial values (basis: 1929=100) rose from 143.2 in Jan. 1941 to 194.3 in Aug. 1941.

Mineral Production.—Mexico's money economy is based on mining. In 1940 metallic production was valued at 645,067,000 pesos. In world production, Mexico ranked first in silver, second in lead and fourth in gold in 1941. Silver production in 1940 was 2,570,394 kg. (1939: 2,359,839 kg.), increasing 2.3% in the first half of 1941. The principal metals mined, with 1940 volume (value in pesos in parentheses) are: gold, 27,468 kg. (164,481,000); silver, 2,570,394 kg. (157,223,000); lead, 196,252 tons (122,609,000); zinc, 114,955 tons (91,110,000); copper, 37,600 tons (51,510,000); antimony, 12,268 tons (20,757,000); mercury, 401,715 kg. (10,929,000); cadmium, 814 tons (8,291,000); iron, 68,163 tons (3,772,000); white arsenic, 9,266 tons (1,165,000); others, 547,646 tons (10,876,000). Coal production in 1940 was 547,646 tons. Holding sixth place in world petroleum production, Mexico's 1941 output was estimated at 40,380,000 bbl. (1940: 41,876,000 bbl.).

Other Resources.—Other important resources are fishing on the west coast and the increasingly important tourist trade, mostly from the United States. In 1940, a total of 130,170 tourists entered Mexico (1939: 136,477), 61,450 reaching Mexico City (1939: 50,263) and spending 61,160,300 pesos (1939: 50,199,700 pesos). In 1941, an estimated 200,000 tourists spent almost 70,000,000 pesos in Mexico. (*See* also HISPANIC AMERICA AND WORLD WAR II; INTERNATIONAL LAW; PETROLEUM; UNITED STATES.)

Mica. Sheet mica output in the United States in 1940 was 1,625,437 lb., an increase of 100% over 1939, but the value of the output, at $291,685, had increased 110%. The domestic output supplied only a small fraction of the needs, and imports included 6,122,731 lb. of scrap, 1,534,188 lb. of uncut sheet, 76,010 lb. of cut sheet, 7,386,397 lb. of splittings and 16,505 lb. of manufactured mica. Except for scrap, imports increased still further in 1941, but as preliminary data are not separated into the individual items, direct comparison is impossible. Imports of scrap and uncut sheet combined, which were 7,656,919 lb. in 1940, had dropped to 2,584,010 lb. in the first eight months of 1941; while this is apparently a heavy drop, since the value increased from $599,176 in 1940 to $617,332, the decline must have been confined to the cheaper scrap, while the more expensive sheet mica increased. In like fashion, the total of cut sheet and splittings combined was 7,482,407 lb., valued at $1,865,565, in 1940, while in the eight months of 1941 the weight reported was 6,596,040 lb., but the value was only $781,467, indicating that the relative proportion of splittings in the combination had been increased materially.

No current data could be secured on production and exports in India, the world's chief source of supply, but such information as was received seemed to indicate progress, demand from such countries as were accessible for export having compensated for the loss of those to which exports were prohibited. Great Britain and the United States presumably were getting the major portion of the exports. (G. A. Ro.)

Michigan. One of the north central group of states, Michigan was the 26th state admitted to the union; it is popularly known as the "Wolverine state." Area, 97,940 sq.mi. (including 39,960 sq.mi. of Great Lakes' water surface); pop. (1940) 5,256,106; (estimate Jan. 1, 1942) 5,315,000. Of the state's population in 1940, 3,454,867 were urban, or 65.7%; 1,801,239, or 34.3% were rural. Whites comprised 95.892% of the population, nonwhites 4.108% (215,934). Of the whites, 81.93% were native-born, 18.07% foreign-born. Capital, Lansing (78,753). Larger cities were Detroit (1,623,452); Grand Rapids (164,292); Flint (151,543); Saginaw (82,794).

History.—On Jan. 1, Murray D. Van Wagoner, Democrat, succeeded 81-year-old Luren D. Dickinson, Republican, as governor of Michigan. The new legislature was dominantly Republican; considerable interest was aroused, therefore, in the fate of 58 appointments which the retiring Gov. Dickinson had submitted to the incoming senate. At first it appeared that the senate would confirm the rival appointments made by the incoming governor. In nine instances, however, the Republican senate chose to confirm Dickinson appointees; in October the state supreme court, by refusing—in a four-to-four vote along strictly party lines—to issue an order requiring one of the Dickinson appointees to show cause why he stayed in office, endorsed, in effect, the nine appointments of the former governor.

The legislature, convening in its 61st session, proved to be an active one. A deadlock occurred, however, when the Republicans discovered, as they were preparing to adjourn in July, that they could not muster the necessary two-thirds vote to override any of 33 vetoes of the Democratic governor. The legislature then recessed for three months. When it reconvened in October, peace was negotiated with the governor, the Republicans being allowed to override 11 appropriation vetoes while the governor got his way on all policy-making vetoes. Included in the work of the legislature were laws providing for the consolidation of most of the revenue-collecting departments, re-enacting regulations for milk-price fixing, implementing new constitutional amendments to provide "clean election" machinery to prevent fraud in invoking the initiative and referendum, liberalizing the Michigan unemployment compensation act and making industrial sabotage a felony. The legislature failed in a vigorous attempt to override the governor's veto of a law to prevent the consolidation of banks and the erection of banking chains.

In all, 382 laws were enacted. By the terms of the state constitution, unless acts are given immediate effect at the time they pass, the effective date is 90 days after adjournment. Of the laws passed, 116 were given immediate effect. When the legislature reconvened in October, and found itself hard pressed by various groups wanting immediate effect, it adopted a concurrent resolution giving immediate effect to 55 additional acts. Early in Jan. 1942, however, the state supreme court by a unanimous decision ruled that the legislature in taking this step had exceeded its constitutional authority. Accordingly, more than two-thirds of the laws passed by the legislature did not become effective until more than 12 months after its session had begun.

Among the more important governmental changes in 1941 was the inauguration of a new four-member civil service commission to supervise the broad merit system established by constitutional referendum in Nov. 1940. Widespread acclaim greeted Governor Van Wagoner's appointments to the commission: George J. Burke, Democrat, a pioneer in the cause of the merit system in Michigan, who became chairman; former Governor (1921–27) Alex J. Groesbeck, Republican; John C. Beukema, Republican, and William Palmer, Democrat. Before many months had passed, 16,987 of an estimated 18,000 state employes were under civil service.

According to the provision in the state constitution providing for consideration every 16 years as to whether a constitutional convention shall be held, such a decision must be made in Nov. 1942. Accordingly, Gov. Van Wagoner appointed a 35-member constitutional study commission, with Justice George E. Bushnell of the state supreme court as chairman, to advise the electorate as to what changes it would be desirable to make in the state constitution.

In the April elections, George E. Bushnell and Edward M. Sharpe were re-elected supreme court justices on a nonpartisan ballot; in an extremely close race for the office of regent of the university, Franklin M. Cook and Charles F. Hemans, Democratic incumbents, were defeated by Earl L. Burhans and Alfred B. Connable, Republicans. E. B. Elliott, Republican, was re-elected superintendent of public instruction; Wynand Wichers, Republican, was re-elected member of the state board of education.

Following the appointment in April of State Supreme Court Justice Thomas F. McAllister to be a judge of the United States circuit court of appeals, Gov. Van Wagoner filled the vacancy in the state supreme court by the appointment of former Attorney General (1937–39) Raymond W. Starr.

The year 1941 saw the beginning of a widespread program of "clean-up" in politics and government. When a trial of Frank D. McKay, Republican national committeeman, in federal court on a charge of using the mails to defraud, resulted in a divided jury, steps were taken by the United States government to conduct a new trial. Meanwhile in a state court, Duncan C. McCrea and Thomas C. Wilcox, former prosecutor and sheriff, respectively, of Wayne county, were convicted on charges of conspiracy to protect vice and gambling; while former mayor of Detroit (1937–39) Richard W. Reading and 14 others were convicted on charges of conspiracy to protect a $10,000,000 a year "numbers" racket.

In labour ranks in Michigan a momentous event occurred in June: the Ford Motor company, which had long vigorously opposed granting a union contract, agreed with the United Automobile Workers of C.I.O. to establish a union shop.

Education.—In 1939–40, elementary school enrolment (through 6th grade) in Michigan was 580,925, with 32,736 teachers; secondary school enrolment (7th through 12th grades) was 396,920, with 13,373 teachers. Enrolment for state institutions of higher learning and their teaching staffs (in parentheses) were as follows: University of Michigan, 13,011 (773); Michigan State college, 8,472 (436); Michigan College of Mining and Technology, 998 (73); Michigan State Normal college, 2,393 (187); Western Michigan College of Education, 3,068 (215); Central Michigan College of Education, 1,556 (99); Northern Michigan College of Education, 693 (57).

Public Welfare, Charities, Correction.—There was a general downward trend in the number of persons receiving direct state relief, from 172,170 in Jan. 1941 to 97,980 in November. For the first 11 months of 1941, the monthly average number of individuals aided, and the monthly average of assistance payments were as follows: direct relief, 127,696 ($932,242.82); old age assistance, 86,866 ($1,498,337.05); dependent children, 50,002 ($859,414.31); the blind, 1,240 ($29,847.73).

There were three state-supported penal institutions: the state prison of southern Michigan at Jackson, the state house of correction at Marquette, and the Michigan reformatory at Ionia; the total number of prison inmates in the state Dec. 31, 1940 was 7,419.

Communication.—In 1940, the state system of highways included: hard-surface road, 5,945 mi.; gravel road, 2,932 mi.; earth road, 77 mi.; miscellaneous, 288 mi. In the year ending June 30, 1940, disbursements of the state highway department for administration, maintenance and construction totalled $58,868,528.31. Figures for 1939 showed 7,338 mi. of railways in the state. Total number of airports in 1941 was 121.

Banking and Finance.—As of Sept. 24, 1941, there were 364 commercial banks, industrial banks and trust companies in Michigan, with total deposits of $880,000,000 and total resources of $1,003,800,000; 235 small loan companies under the supervision of the state banking department; and 176 credit unions chartered under state law.

Agriculture.—The total value of agricultural production in the season of 1940 was $148,737,000; the total acreage harvested was 7,847,000. Cash income from crops was $85,547,000; from livestock and livestock products, $1,091,000, and from government payments, $12,773,000. A drought in the spring and summer of 1941 proved damaging to crops, particularly oats, hay and corn.

Table I.—*Leading Agricultural Products of Michigan, 1940 and 1939*

Crop	1940	1939
Corn, bu.	49,856,000	58,830,000
Wheat, bu.	17,812,000	15,784,000
Oats, bu.	60,489,000	42,712,000
Barley, bu.	5,796,000	5,771,000
Rye, bu.	1,260,000	1,512,000
Potatoes, bu.	20,640,000	24,250,000

Manufacturing.—Total estimated value of manufactures in 1939 was $4,341,413,139; in 1937, $5,296,100,960; in 1935, $3,986,178,348. Total employment figures for 1939, including both wage earners and salaried employees, were 589,319, with a total of $964,491,813 earned.

Table II.—*Principal Industries of Michigan, 1939 and 1937*

Industry	Value of products	
	1939	1937
Motor vehicles, not including motorcycles	$2,284,666,538	$1,613,225,661
Motor vehicle bodies and parts		1,313,376,621
Steel works and rolling mill products	.....	130,888,132
Foundry products	.....	114,463,371
Paper	135,162,620	92,418,197
Refrigerators, etc.	51,805,725	75,966,655
Hardware not elsewhere classified	.....	75,134,277

Mineral Production.—The total value of mineral production in Michigan for 1938 was $81,380,602; for 1939, $115,969,514. Considerable expansion took place in petroleum and natural gas industries.

Table III.—*Principal Mineral Products of Michigan, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Iron ore	$37,026,665	$13,139,823
Pig iron	18,872,150	9,806,994
Petroleum	21,350,000	10,300,000
Coke	12,408,881	10,135,722
Cement	10,891,078	8,767,859
Copper	9,148,880	9,161,628
Natural gas	7,411,000	6,387,000
Salt	6,726,912	6,151,154
Stone	5,890,728	4,059,590

Michigan, University of.

Gifts of $500,000 each from the Rockefeller foundation and the W. K. Kellogg foundation made possible the organization of a new school of public health at the University of Michigan during 1940–41. It will be housed in a building, plans for which have been drawn, adjacent to the university hospital group. Dr. Henry F. Vaughan, formerly health commissioner of the city of Detroit, was appointed dean. The new school, the fourteenth of the schools and colleges composing the university, was officially inaugurated in the fall of 1941. Its curriculum is based on that of the former division of hygiene and public health, with important additions. In view of the national emergency the university appointed a central committee on national defense which counselled with students affected by the selective service law, organized an information service on public issues through lectures and other means, and arranged for instruction in subjects bearing on both military and civilian defense. A considerable number of staff members entered the national service as reserve officers or as research experts. Latin-American relations gave rise to numerous activities. Besides co-operating with the state department in welcoming visiting leaders from South America, the university arranged an English language centre for Latin-American students and special courses during the summer session for groups of students from Ecuador and Venezuela. One member of the faculty, Professor Arthur S. Aiton, lectured at the University of Costa Rica during the summer. (A. G. R.)

Midway Islands.

A group of two small islands and several sand islets of the Hawaiian group lying in longitude 177° 23′ W. and latitude 28° 13′ N., 1,149 mi. N.W. of Honolulu, possessions of the United States of America. Sand, the larger island, about 850 ac. in area, has a maximum height above sea level of 43 ft.; the smaller island, Eastern, about 328 ac. in area, is very low.

The islands are enclosed in a circular reef about five mi. in diameter, nearly four-fifths of which is above water. They are nonproductive, being little more than sand dunes, and have no native inhabitants. Sand Island is the site of a commercial cable station.

In 1859 Captain Brooks of the U.S.-owned Hawaiian bark "Gambier" discovered the group and took possession in the name of the United States. Formal possession was taken Aug. 28, 1867 by Capt. Reynolds of the U.S.S. "Lackawanna." An executive order dated Jan. 20, 1903, placed the islands under the control and jurisdiction of the U.S. navy department. Under licence from this department Pan American Airways established facilities on Midway for use in connection with its transpacific commercial airline. The 76th congress authorized the navy department to construct a seaplane base at Midway and appropriated approximately $5,000,000 for the purpose. Construction work on this base was in progress in 1941. (G. L. WF.)

Midway was attacked by Japanese naval and air units Dec. 7,

1941. For a number of days no word was received from the small group of U.S. marines there, and the islands were believed lost.

However, a message received Christmas day from Midway said, "We are still here, Merry Christmas."

By the end of the year, it was apparent that the garrison was still resisting.

Milk. All records for milk production in the United States were broken in 1941. The department of agriculture announced a total milk flow of 117,000,000,000 lb. for the year.

The previous high was 111,072,000,000 lb. in 1940. The five-year (1935–39) average annual production was 104,710,000,000 lb.

For 1942 the federal government called for still larger production, 125,000,000,000 lb., in order that there might be an ample supply of fluid milk and dairy products for home consumption and, in addition, still larger supplies of cheese and evaporated, condensed and dried milk to send to Britain under the lend-lease program of "Food for Freedom." From March 15, 1941, when the department of agriculture began its expanded purchase of agricultural products for Britain, to Dec. 1, 1941, the department bought for such export the following dairy products:

Dry skim milk	32,419,520 lb. at f.o.b. cost of	$ 3,127,841
Dry whole milk	2,575,500 lb. at f.o.b. cost of	737,534
Evaporated milk	13,570,430 cases at f.o.b. cost of	45,742,713
Cheese	137,566,710 lb. at f.o.b. cost of	31,544,071
Butter	65,787 lb. at f.o.b. cost of	20,508

Factors contributing to the heavy milk flow in 1941 were the larger number of milk cows on farms, the unusually mild fall weather, the larger number of cows freshening early in the fall and the liberal feeding of cows owing to high prices for milk and a favourable feed ratio. For example, grain and concentrates fed per milk cow per day, Dec. 1, 1941, in herds kept by dairy correspondents of the department of agriculture were 5.40 lb., the highest on record. The average of such daily feeding for the year was 4.85 lb.

Total milk production Dec. 1 was 8% higher than on the same date in 1940, and production per cow was 5% higher, the largest on record for that date. Milk production in the United States, the department of agriculture reported Dec. 15, 1941, was being pushed as fast as was practicable, but to supply Britain's requirements even more milk would have to be produced or home consumption curtailed. Nov. 1941 was the 16th successive month of increased sales of fluid milk, according to reports made by leading distributors in 152 U.S. markets to the Milk Industry foundation. This distribution was 7,183,228 qt. daily in Nov. 1941, compared with 6,943,035 qt. daily in Nov. 1940.

Widespread increases in milk prices occurred in October, owing partly to seasonal conditions and partly to the diversion of milk to cheese factories and condenseries.

In Chicago, where the retail delivery price was advanced to 15½ cents per quart, members of the city council proposed redefining the Chicago milk shed so that it would include only producers in Illinois, and none in Wisconsin and other states, and thus evade the federal interstate regulation of milk prices.

Two new developments in the milk industry were announced in 1941. The National Dairy Products corporation developed a new casein fibre, "Aralac," which the felt hat industry adopted as a substitute for foreign rabbit fur. A new system of zoning milk deliveries in Auckland, N.Z., reduced the mileage of milk trucks from 3,125 to 1,036 mi. per day, with a resultant saving in gasoline. (*See* also BUTTER; CHEESE; DAIRYING.) (S. O. R.)

Miller, Dayton C. (1866–1941), U.S. physicist and astronomer, was born March 13 at Strongsville, Ohio. After 1904 Dr. Miller conducted many experiments in an effort to determine whether the ether is carried along through space. In the summer of 1925, after making some 100,000 measurements in his special laboratory atop Mt. Wilson, Dr. Miller announced he had obtained evidence that there is an ether drift. The results of this investigation were then believed to have upset the famous Morley-Michelson experiment of 1887, upon which Einstein based his theory of relativity. In 1926 Dr. Miller won a $1,000 award from the American Association for the Advancement of Science for his theory of ether drift. Subsequent investigations tended to prove that Miller's experiments were inconclusive. A leading authority on acoustics, Dr. Miller had been preparing to consult with the U.S. army ordnance department on new range-finding equipment only a few days before he died in Cleveland, Ohio, Feb. 22. For his experiments, see *Encyclopædia Britannica.*

Mineral and Metal Prices and Production.

The first of the accompanying tables (page 436) gives data available by Jan. 1, 1942, on mineral and metal production during 1940 for the leading commodities and the more important producing countries. However, many of the figures are estimates, and others are lacking.

The *Statistical Summary* of the Imperial institute did not appear after 1938, and the data presented was collected from all available sources.

The *Mineral Industry* index of aggregate world mineral production rose in 1940 to a new high at 159, as compared with 152 in 1939, 139 in 1938, and the former high of 150 in 1937. The chief items contributing to the increase were, in order of magnitude, copper, petroleum, coal, aluminum, tin, tungsten, gold, diamonds and chromite.

The second accompanying table (page 437) shows the range of prices for leading metals and minerals during 1941 on the New York market and the opening and closing prices on the London market. Few prices advanced in any material degree, except those imported, for which freight and insurance rates increased. The *Engineering and Mining Journal* index of nonferrous metal prices rose from 82.48 in January to 84.32 in November, only June and August not showing increases.

In many cases the open market price was replaced by a controlled maximum, both in the United States and Great Britain. (G. A. Ro.)

NOTES: A figure in parentheses is for the preceding year, 1940 data not being available. A figure without decimals or with less than the normal number is an estimate. The letter "p" indicates a production unknown, smaller than the minimum base of the table, while "P" indicates an unknown output of greater size.

[1]Crude magnesite in 1938, except U. S. [2]K_2O equivalent of salts produced in 1938; except U. S. [3]Mainly crude sulphur, but includes some ore, where sulphur content is not reported; also includes some sulphur recovered from industrial gases, especially from the roasting of sulphide ores. [4]Concentrates with 60% WO_3.

Mineralogy. In spite of greatly disturbed international conditions, many significant contributions were made in 1941. These included the study on the relation of chemical composition, colour and refractive index of biotites, by Hall (*American Mineralogist*, January), Colorado cerite, by Hanson and Pearce (*ibid.*, February), types of colouring in minerals, by Kennard and Howell (*ibid.*, July), proxenes, by Hess (*ibid.*, September and October), the relative corrosion hardness of agate, synthetic corundum and other minerals, by Eppler (*Zentralblatt für Mineralogie, etc.*, Nos. 1 and 4), *Mineralogy 1888–1938*, by Kraus (Fiftieth Anniversary Volume of the Geological Society of America), and the fifteenth edition of Dana's *Manual of Mineralogy*, by Hurlbut (Wiley, New York.)

During the year Herbert P. Whitlock, curator of minerals at the American Museum of Natural History, New York, since 1918, retired from active service. Dr. Whitlock was largely instrumental in arranging the museum's excellent exhibition collection of minerals. He is the author of many scientific papers, and the mineral Whitlockite, a tricalcium phosphate, is named in his honour.

Gem Minerals.—The cutting of the Vargas diamond weighing 726.6 carats, found in Minas Geraes, Brazil, in July 1938, and subsequently purchased by Henry Winston, Inc., of New York city, was begun during the year 1941. This was the second large diamond to be cut in the United States, the other having been the Jonker diamond, which weighed 726 carats, found in Jan. 1934 near Pretoria.

On account of the greatly increased demand for diamonds for industrial purposes, a symposium on diamonds was conducted at the annual meeting of the Mineralogical Society of America in Boston. The production and supply of diamonds, the cutting of gem diamonds, the manufacture and the use of diamond wire-drawing dies in the national defense program, diamond-set tools, bonded diamond wheels and evaluation criteria were discussed. This was the first symposium covering the various uses of diamonds that had ever been held.

To further the dissemination of information concerning the use of diamonds in industry the *Goldsmith's Journal* (London) added a section, entitled "Industrial Diamond Review."

Since the invasion of the low countries and France, the importation of synthetic rubies and sapphires, and of watch jewels and bearings manufactured from them, was practically cut off. These materials are highly essential in the manufacture not only of watches but of precision electrical and physical apparatus. In 1941 the U.S. production of these synthetic gems was begun.

Although synthetic emeralds had been produced in Germany for a number of years, their first production in the U.S. was announced during 1941 by Caroll F. Chatham, a chemist in San Francisco.

The following were noteworthy publications of the year on gems: "The Diamond Industry," by Ball (*Jewelers' Circular-Keystone*), "Cutting of Diamonds for Industrial Purposes," by Kraus and Slawson (*American Mineralogist*, March), *Mining of Gems and Oriental Stones by American Indians*, by Ball (Bulletin 128, Bureau of American Ethnology, Smithsonian Institution), and *Practical Gemmology*, by Webster (N.A.G. Press, Ltd., London.)

Roebling Medal.—The fourth Roebling medal of the Mineralogical Society of America was awarded to Dr. Esper S. Larsen, Jr., at the annual meeting of the society at Boston, Dec. 29. Dr. Larsen, professor of petrography at Harvard university since 1923, made many valuable contributions to mineralogy, especially to the determination of nonopaque minerals by microscopic methods. (*See* also MINERAL AND METAL PRICES AND PRODUCTION.) (E. H. KR.)

Miniature Photography: *see* PHOTOGRAPHY.

Minnesota. A north central state of the United States, popularly known as the "Gopher state." Area, 84,068 sq.mi., of which 4,059 are water. Pop. (1940) 2,792,300. The rural population was 50.2% of the total. Capital, St. Paul (287,736). The only city in the state with a larger population was Minneapolis (492,370); Duluth had 101,065.

History.—During 1941 the state legislature adopted a broader child-welfare program, provided for the enlargement of the Gillette State Hospital for Crippled Children, improved the labour conciliation law, amended the unemployment compensation law, provided for paying rural credit losses, and liberalized the old-age assistance lien. Officers of the state in 1941 were: Governor, Harold E. Stassen; lieutenant governor, C. Elmer Anderson; secretary of state, Mike Holm; treasurer, Julius A. Schmahl; auditor, Stafford King; attorney general, J. A. A. Burnquist; chief justice, Henry M. Gallagher.

Education.—In 1940–41, Minnesota had 8,339 elementary, 661 secondary and 440 consolidated schools; also 13 junior colleges. Enrolment was 318,921 with 13,260 teachers in the elementary grades; 192,433 with 8,488 teachers in the secondary grades; 2,940 with 174 teachers in junior colleges; 11,157 in adult-education classes with 237 teachers; and 485 in teacher training departments with 34 teachers. The total public school expenditure for 1940–41 was $58,420,911. The University of Minnesota had a regular enrolment of 14,345 full-time students in the fall of 1941 and a faculty of 1,098 in all branches and sessions. It ranked second in the United States in enrolment. Six state teachers' colleges had an enrolment of 7,265 with 325 teachers. Minnesota's educational system numbered 13 colleges in addition to the state university.

Charities and Correction.—During the year ending June 30, 1941, $9,040,511 was spent on general relief, the average number of cases being 33,043.

At the end of 1941 the general relief load in the state was estimated as 38% lighter than at the end of 1940. The WPA employed 40,464 persons during 1941 on projects on which $42,795,120 was spent; $12,199,355 of this amount was contributed by sponsors. In the year ending June 30, 1941, $15,982,405 was spent for old-age assistance, the average number of recipients being 62,898. A total of $3,801,228 was spent on dependent children; this sum cared for an average of 9,194 families and 21,884 children.

Communication.—During 1940, $28,491,421 was spent on highways in the state. The highway mileage totalled 11,261 mi. at the end of 1941; railroad mileage for 1940 was 9,199 mi. About 2,000,000 tourists visited Minnesota in 1941, making the estimated $150,000,000 tourist trade the state's third most important industry.

Banking and Finance.—On July 1, 1941, there were 484 state banks, one mutual savings bank and four trust companies in Minnesota with deposits of $306,247,103; 186 national banks with deposits of $817,938,000 and resources of $905,473,000; 44 building and loan associations with resources of $34,489,126. The state revenue fund and expenditure for the year ending July 1, 1941, was as follows: receipts to June 30, 1941, $42,259,183; overdrawn July 1, 1940, $2,119,137; payments to June 30, 1941, $45,379,411; balance July 1, 1941, $658,184. The outstanding debt on June 30, 1941, was $118,982,774, a slight reduction from that of 1940.

Agriculture.—The total value of farm crops in 1940 was $252,080,000; the harvested acreage, 19,114,000; cash income from crops, $112,368,000; from livestock and livestock products, $270,164,000; and from government payments, $40,552,000. Minnesota had an unusually favourable agricultural year in 1941 with gross cash sales of products probably the largest in many years, and perhaps as great as for any year since World War I. The 1941 corn crop was the second largest produced in Minnesota. Cattle production continued to expand.

Table I.—*Leading Agricultural Products of Minnesota, 1941 and 1940*

Crop	1941 (est.)	1940
Barley, bu.	44,980,000	57,348,000
Rye, bu.	...	5,958,000
Flaxseed, bu.	14,858,000	16,695,000
Wheat, all, bu.	21,268,000	32,069,000
Corn, all, bu.	197,868,000	172,457,000
Oats, bu.	116,123,000	180,795,000
Tame hay, tons	5,672,000	4,702,000
Potatoes, bu.	18,204,000	23,750,000

Manufacturing.—Principal industries in 1939 were as follows: meat packing $198,124,044; flour and grain milling $67,437,432; butter making $78,029,290; making of bread and other bakery products $21,349,382; printing and publishing (newspaper and periodical) $21,964,698; liquor manufacturing (malt) $23,364,854.

Mineral Production.—The 1941 output of iron ore in Minnesota was estimated at close to 64,000,000 gross tons, with a value of about $221,000,000 as shipped from the state. The production of rock wool was begun in 1941 in Minnesota and a second plant was built.

Table II.—*Principal Mineral Products of Minnesota, 1940 and 1939*

Mineral	Value, 1940	Value, 1939
Iron ore	$118,947,068	$97,113,591
Coke	3,662,908	3,684,811
Stone	1,987,822	2,339,774
Sand and gravel	1,024,716	1,942,430

Minnesota, University of. An institution of higher education at Minneapolis, Minn. Collegiate enrolment at the university, which had more than doubled in the previous 20 years, experienced its first significant drop in 1941 since the 1932–35 decline. Fall quarter, 1941, figures showed a falling off of 10.5% from those of 1940–41, which were the highest in the institution's history, and ranked it again second among U.S. universities in regular collegiate enrolment. The net total enrolment for the year ended June 30, 1941 was 45,588, of whom 19,140 were women. Opened for use in the fall of 1941 was a new $350,000 field-crops building on the farm campus. National defense activities occupied an important place in the program of the university, and a number of staff members were granted leaves of absence to engage in various aspects of the defense effort. In many university laboratories staff members carried on special research studies under agreements entered into by the university with the National Research committee. A special program was begun during the spring quarter 1941 for men students subject to selection for army service. It consisted of examinations, tests, and corrective work in the areas of health, physical fitness and recreation; and was being continued on an expanded scale in 1941–42. On June 30, 1941 accessioned volumes in the library totalled 1,183,620. Walter C. Coffey, dean of the department of agriculture, became acting president upon the retirement June 30, 1941 of Guy Stanton Ford. (W. C. C.)

Minor, Robert (1884–), U.S. communist leader, was born July 15 in San Antonio, Tex. His father was a school teacher, lawyer and district judge, and his mother was a member of Gen. Sam Houston's family. Young Minor attended school only four years and in his teens worked as messenger boy, sign painter's apprentice and carpenter. For a time he was cartoonist on the *San Antonio Gazette* and the *St. Louis Post-Dispatch*. In 1907 he joined the Socialist party, dividing his time between cartooning and political activities. Later he was cartoonist for the *New York World*, then the socialist newspaper, the *New York Call*. In 1916–18 he was an organizer for the International Workers' Defense league, handling publicity in the Tom Mooney case. In 1918 he was a war correspondent in Russia. During 1924–26 he lectured for the Communist party and in 1928 became editor of the *Daily Worker*. He was Communist candidate for mayor of New York city in 1933, and for governor of New York in 1936. On Feb. 24, 1941 he was made acting secretary of the Communist party of the United States, replacing Earl Browder, who had been sentenced to four years in federal prison for passport fraud.

Mississippi, admitted as a state in 1817; popularly known as the "Bayou state"; area, 47,716 sq.mi.; population (U.S. census, 1940), 2,183,796; capital, Jackson, 62,107, largest city in the state. Of the state's population in 1940, 432,882 were urban, or 19.8%. In 1940 there were 1,106,327 whites; 1,074,578 Negroes; 2,174,917 native born; 8,879 foreign.

History.—The state of Mississippi votes solidly the Democratic ticket. In the presidential election of 1940 the following votes were cast: Democratic balloting 168,267, regular Republican, 2,814, Independent Republican, 4,549, Socialist, 193.

For 1940–44 principal officers of the state were: governor, Paul B. Johnson; lieutenant governor, Dennis Murphree; secretary of state, Walker Wood; attorney-general, Greek L. Rice; state tax collector, Carl N. Craig; state treasurer, Lewis S. May; superintendent of education, J. S. Vandiver; presiding officer of the state senate, Lieutenant Governor Dennis Murphree; presiding officer of the house of representatives of the state, Sam E. Lumpkin. The state senate has 49 members in addition to the presiding officer, the lieutenant governor. The house of representatives has 140 members. In the membership of the state legislature farmers predominate with a total of 67 in the two houses; lawyers, 59; teachers, 23; merchants, 9; insurance agents, 5; with 13 other occupations represented in the membership with from five to one member. All members of the legislature are members of the Democratic party.

Education.—The state maintains two systems of public schools, one for whites and one for Negroes, as required by the constitution. Consolidation of rural schools has been extensive since 1930, the rural schools of all 82 counties of the state having been to some extent consolidated.

Banking.—There were in 1941 in the state 183 state banks, including 24 branch banks and 18 branch offices, and 24 national banks, including one branch bank. Bank resources stood at $273,946,371.98 on Sept. 24, 1941, with deposits at $242,956,784.07.

Agriculture and Manufacturing.—Agriculture provided direct employment for 64.4% of the state's total population. Sixty-three and two-tenths per cent of the total land area of the state is used for agricultural purposes, there being 291,092 farms covering 19,156,058 ac. in 1941, with a crop output of $212,159,000, of which $119,140,250 was cotton and $29,550,912 was cotton-seed.

Table I.—*Leading Agricultural Products of Mississippi, 1941 and 1940*

Crop	1941	1940
Cotton, bales	1,445,000	1,250,000
Corn, bu.	47,753,000	40,544,000
Oats, bu.	5,725,000	3,770,000
Sweet potatoes, bu.	6,935,000	4,485,000
Sugar-cane syrup, gal.	2,856,000	1,744,000
Peanuts, lb.	15,515,000	13,500,000
Pecans, lb	5,089,000	2,717,000

Manufacturing in recent years has developed rapidly, particularly manufacturing having to do with the use of cotton and the use of wood products.

Mineral Production.—The total value of mineral production in Mississippi in 1939 was $5,192,156; in the preceding year it was $5,209,547.

Table II.—*Principal Mineral Products of Mississippi, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Natural gas	$3,300,000	$3,210,000
Sand and gravel	810,933	1,240,974
Clay products	761,686	605,311
Petroleum	94,000	..

(A. B. Bu.)

Missouri. A west north central state of the U.S.A., admitted to the union in 1821; popularly known as the "Show Me" state. Area, 69,270 sq.mi.; pop. (1940), 3,784,664 (51.8% urban). Capital, Jefferson City (24,268). Largest cities: St. Louis (816,048), Kansas City (399,178), St. Joseph (75,711), Springfield (61,238). Aliens (1940) numbered 42,049.

History.—The 61st session of the Missouri general assembly (Jan. 8–July 12, 1941) remained in session longer than any previous assembly. Controlled by the Democrats, it immediately launched an unconstitutional scheme to prevent the inauguration of Forrest C. Donnell (Republican), elected governor in 1940 by a 3,613 plurality; but on Feb. 26, as the result of a decision by the state supreme court, Donnell was inaugurated. Then the assembly, on petition of the unsuccessful Democratic candidate, Lawrence McDaniel, proceeded in a constitutional manner and ordered a recount of the gubernatorial vote. On May 21, with the recount about half finished and with Donnell's plurality considerably increased, the assembly, at McDaniel's request, dismissed the contest. The legislature also enacted laws establishing a state defense council, a secret ballot, and the control of congenital syphilis. In addition, it resolved to submit two constitutional amendments to the electorate in 1942: one to repeal the nonpartisan court amendment, and the other to increase the pay of members of the legislature.

The major state officers (1941), all Democrats except the Republican governor, were: Forrest C. Donnell, governor; Frank G. Harris, lieutenant governor; Dwight H. Brown, secretary of state; Forrest Smith, auditor; Wilson Bell, treasurer; Roy S. McKittrick, attorney general. Twenty-eight Democrats and six Republicans constituted the state senate; 85 Democrats and 65 Republicans, the house of representatives.

Education.—For the school year ending June 30, 1941, the public school system consisted of 9,252 elementary schools, with 505,362 pupils and 18,119 teachers; 999 secondary schools, with 196,678 pupils and 8,147 teachers; the University of Missouri, including the Missouri School of Mines and Metallurgy, with 6,977 students and 522 teachers; Lincoln university (Negro), with 638 students and 68 teachers; 5 state teachers' colleges, with 10,760 students and 389 teachers; schools for the deaf and blind; and a Negro vocational school.

Public Welfare, Charities.—For the year ending June 30, 1941, unemployment compensation totalled $5,970,203. The state employment service made 137,266 placements. WPA earnings amounted to $34,378,083; old-age assistance, $21,331,528; aid to dependent children, $4,134,779; general relief, $3,791,235; NYA, $2,171,316. In June 1941, 113,787 persons received old-age assistance; 57,395, general relief; 47,402, WPA earnings; 32,297, aid to dependent children; 14,874, NYA funds.

Communication.—On Dec. 31, 1940, Missouri had 116,693 mi. of highways, of which 15,869 mi. were state and 101,824 mi. rural. In 1940 railroad mileage totalled 7,042 mi.

Banking and Finance.—On Sept. 24, 1941, Missouri had 534 state banks, with deposits of $771,664,000 and resources (loans and investments) of $757,473,000, and 84 national banks, with deposits of $551,440,000 and resources (loans and investments) of $527,319,000. On June 30, 1941, there were 195 building, savings and loan associations, having total assets of $135,406,007.

The balance in the state treasury on Dec. 31, 1940, was $21,220,839.98; receipts for 1941, $115,281,595.73; disbursements for 1941, $111,425,600.09; balance in state treasury, Dec. 31, 1941, $25,076,835.62; total state bonded indebtedness, Dec. 31, 1941, $89,751,000.

Agriculture.—Missouri's 1941 crops, harvested from 12,303,000 ac., were valued at $232,420,000, a 29% increase over the value of 1940. Winter-killing made the winter wheat crop the second smallest since 1874. Floods, heat, drought and fall rains damaged other crops, especially corn and tame hay. In 1940 Missouri's cash income from crops and livestock was $277,006,000; federal government payments were $25,091,000.

Table I.—*Leading Agricultural Products of Missouri, 1941 and 1940*

Crop	Value, 1941	Value, 1940
Corn	$83,780,000	$74,426,000
Cotton (lint and seed)	51,416,000	21,847,000
Tame hay	31,666,000	23,212,000
Oats	19,587,000	15,285,000
Winter wheat	18,397,000	22,457,000

Manufacturing.—During 1939 Missouri's industries manufactured products valued at $1,388,056,267, employed 178,538 wage earners and 24,275 salaried persons and paid $190,735,851 in wages and $58,937,137 in salaries.

Table II.—*Principal Industries of Missouri, 1939 and 1937*

Industry	Value, 1939	Value, 1937
Meat packing (wholesale)	$107,254,213	$116,576,053
Footwear (except rubber)	100,346,106	103,253,379
Iron and steel (excluding machinery)	80,059,177	77,681,234
Wearing apparel	85,297,177	76,998,667
Malt liquors	41,412,301	34,272,016
Drugs, medicines	23,006,499	24,335,460

Mineral Production.—The value of Missouri's mineral production in 1939 was $45,619,104, a 15% increase over that of 1938. In 1940 the value continued to increase. Missouri's lead production in 1940 was 172,052 tons, 37.6% of the U.S. output.

Table III.—*Principal Mineral Products of Missouri, 1940 and 1939*

Mineral	Value, 1940	Value, 1939
Lead	$17,205,200	$14,690,114
Cement	Fig. not available	7,420,013
Bituminous coal	Fig. not available	6,124,000
Stone	6,170,867	4,589,986
Clay (raw and products)	Fig. not available	3,931,065
Lime	3,184,293	2,800,379
Barite	1,216,069	1,163,870

(R. P. Br.)

Mitchell, Charles Hamilton (1872–1941), Canadian general and educator, was born Feb. 18 in Petrolia, Canada. After receiving a civil engineering degree from the University of Toronto in 1898, he worked as a consulting engineer on many Canadian hydroelectric power projects and became a member of government water-power boards. He served overseas during the war of 1914–18, attained the rank of a brigadier general in the war office intelligence service and received the D.S.O., as well as honours from France, Belgium and Italy. From 1919 until his retirement shortly before his death, Gen. Mitchell was consulting engineer and dean of the faculty of applied science and engineering at the University of Toronto. He died in Toronto, Aug. 26.

Mochizuki, Keisuke (1867–1941), Japanese statesman, was born in March at Hiroshima-ken. He was elected 13 times to the lower house of the diet. He was minister of communications in 1927 and again in 1935. In 1928 he was appointed home minister. Chief whip for the Seiyukai party, he later was president of a minor political party. He died Jan. 1 in Tokyo.

Moelders, Werner (1913?–1941), German war pilot, top-ranking ace of Hitler's *Luftwaffe*, first gained combat experience in the Spanish civil war, (1936–39)

by flying for Franco in the German Condor legion. He was credited with destroying 12 loyalist craft. During World War II, Moelders was credited with shooting down 103 planes, bettering the record of Baron Richthofen, ace of World War I, who downed 80 allied planes. Moelders, who won many medals and had been personally cited by Hitler for bravery and heroism, met his death in the crash of a transport plane near Breslau, Nov. 22. He was returning from the funeral of Gen. Ernst Udet (*q.v.*).

Molasses: *see* SUGAR.

Molotov, Vyacheslav Mikhailovich

(1890–), Russian statesman, was educated at Petersburg polytechnic and during his youth organized bolshevik student groups and worked for the newspaper *Pravda*. February of 1917 found him a member of the Petrograd soviet executive committee. In 1920 he was appointed secretary of the central committee of the communist party of the Ukraine, and in the following year he held this office for the whole of the U.S.S.R. He was appointed president of the Soviet of People's Commissars in 1930 and was named foreign commissar May 3, 1939, to succeed Maxim Litvinov. The latter appointment foreshadowed the temporary shift in soviet foreign policy which led to the nazi-soviet pact of non-aggression, signed by Molotov in Moscow, Aug. 24, 1939. On the surface, German-Russian relations continued amicable during the next 20 months, especially after Molotov's visit to Berlin Nov. 12–13, 1940. But Hitler, in his war proclamation against the U.S.S.R. in 1941, revealed that he and Molotov had expressed widely divergent views on several subjects during their talks in Berlin the preceding November.

On May 6, 1941, Molotov resigned as premier of the U.S.S.R. and was succeeded in this office by Stalin (*q.v.*); he remained as foreign commissar, however, and took over the vice-premiership. Six hours after the German invasion started on June 22, Molotov broadcast his condemnation of the attack—"a perfidy unparalleled in the history of civilized nations"—and his prediction that the U.S.S.R. would administer a "crushing blow" to its enemy. On July 1 Stalin named him vice-chairman of the soviet defense committee, to which was delegated the full authority of state. On July 13 Molotov signed the British-U.S.S.R. mutual-aid pact in which each nation agreed not to make a separate peace. During the summer months he held a number of interviews with U.S. and British officials, among them Harry Hopkins and Lord Beaverbrook (*qq.v.*). In October Molotov moved the foreign office temporarily to Kuibyshev.

Molybdenum. World production of molybdenum contained in ores in 1940 recovered from the 1939 drop and somewhat exceeded the former high of 1938, with a total of 36,704,000 lb., of which 34,313,000 lb. was from the U.S. and 22,782,600 lb. was supplied by the Climax mine in Colorado. Total U.S. shipments during 1940 were 25,329,000 lb., leaving 8,984,000 lb. to add to stocks. Exports in 1940 were 6,585,000 lb., against an estimated 11,300,000 lb. in 1939, exports being restricted to Canada and Great Britain. Deducting exports from total shipments, it is to be noted that domestic consumption in the U.S. declined 11% in 1940, as compared with 1939. Production outside of the U.S. is limited to comparatively small amounts in Norway, Mexico, Peru and Morocco. Germany in 1941 had access to the Norwegian output, which approaches 1,000,000 lb. annually, and was reported to have installed a recovery plant in Greece. A new Russian plant for the recovery of molybdenum concentrates from copper ore was under construction in Kazakstan, but it was not known whether it had been put into operation. (G. A. Ro.)

Monaco. A principality on the Mediterranean coast, bounded on the land side by French (unoccupied) territory. Area 375 ac. (0·59 sq.mi.); pop. (1939), 23,973. Chief towns: Monaco, La Condamine, Monte Carlo; ruler: Prince Louis II; language: French. The chief occupation is catering for visitors, who, before the start of war in 1939, numbered more than 2,000,000 annually.

Monazite. Treatment of Florida beach sands was begun in 1940, for the recovery of rutile, ilmenite, zircon and monazite, but no data were available on production. Except for small outputs in 1915–17 and 1925, this was the first production of monazite in the United States since 1910. Most of the world output comes from India, Netherlands East Indies and Brazil, but no recent data are available. (G. A. Ro.)

Monetary Units of Leading Countries: *see* EXCHANGE CONTROL AND EXCHANGE RATES.

Mongolia (INNER AND OUTER). A vast, sparsely populated tableland in northeastern Asia, arid and desert in stretches, Mongolia occupies an area of about 1,000,000 sq.mi. It is bounded on the north by Siberia, east by Manchoukuo, west by Sin Kiang (Chinese Turkestan), south by China. Of these two parts of Mongolia, which were administratively separated in 1921, Outer Mongolia (622,744 sq.mi.) is larger in size; but Inner Mongolia (334,100 sq.mi.) is the more closely settled, as it has a certain amount of industry and agriculture, along with the grazing which is the general characteristic of all the Mongolian regions. Inner Mongolia was formerly organized in the Chinese provinces of Chahar, Suiyuan and Ningsia; but the Japanese, after their occupation of the country, set up three dependent regimes, in Suiyuan, in Tatung, major coal centre of north Shansi and in Kalgan, in Chahar.

Outer Mongolia.—Population in 1941 (estimated) 850,000. Capital, Ulan Bator (formerly Urga). This vast area has been almost completely isolated from the outside world, except from the soviet union, since 1921 when red army troops, pursuing the anti-bolshevik forces of Baron Ungern-Sternberg (subsequently captured and executed) across the Siberian frontier into Outer Mongolia, co-operated in setting up a so-called People's Revolutionary government which maintained the closest contact with the soviet regime in Moscow. Power is vested in a representative assembly, the Great Huruldan, which selects from its members the Little Huruldan, for more frequent sessions. The Little Huruldan, in turn, elects a committee of five, which is charged with the management of current affairs.

Most of the wealth of the Mongols has always consisted in their flocks and herds, and one estimate is that in Outer Mongolia there are 1,340,000 horses, 270,000 camels, 1,500,000 oxen and 10,600,000 sheep. Collectivist measures which were passed by local communists, in line with the general drive for collectivization of agriculture in the U.S.S.R., between 1929 and 1932 led to several uprisings and to a flight of some of the more conservative Mongols into Inner Mongolia. There was a subsequent mitigation of these measures. The vague and disputed boundary between Outer Mongolia and Manchoukuo led to a number of clashes, the most serious being in the neighbourhood of Lake Buir and of Nomonhan. The last developed into a serious pitched battle between Russian and Japanese troops in the summer of 1939.

Wool and bristles and casings are among the most important exports of Outer Mongolia. Trade is financed through the Mongo-

bank, in which the soviet state owns half the capital. The chief trading unit is the Mongo Central Co-operative society. There is an air service between Verkhne-Udinsk, in Siberia and Ulan Bator and a highway between Ulan Bator and the Siberian border town of Kyakhta. Northwest of Outer Mongolia is the little soviet protectorate of Tannu-Tuva, area 64,000 sq.mi., pop., 65,000, capital, Kysylchoto, with communication on the Yenisei river with Siberia.

Inner Mongolia.—Population in 1941, about 1,500,000. Capital, Suiyuan. The course of historical development has been very different from that of Outer Mongolia, and Japanese influence after 1937 was as paramount as Russian influence had been predominant in Outer Mongolia for a much longer period. Inner Mongolia during the '20s was a rough frontier region in which there was an uncertain balance of power between Chinese local war lords and Mongol tribal princes. The settlement of Chinese agricultural colonists from the more overcrowded regions of China was a profitable business, and there was a consequent clash of interest between the nomadic Mongol herdsman and the Chinese farmer, who wished to bring grazing land under the plow. Mongol princes were sometimes bribed to alienate tribal lands—a procedure that was contrary to Mongol custom. Japanese agents were able to exploit this situation and to stir up the Mongols against the Chinese, with the result that there was little Mongol opposition and even some co-operation when the Japanese carried out their military occupation of north China in 1937. Prince Teh, the strongest personality among the Mongol chieftains, who had hitherto endeavoured to preserve a precarious autonomy by playing off Chinese against Japanese, saw no alternative except to accept Japanese suzerainty, and he became head of a nominally independent Mongol regime, with headquarters at Suiyuan.

Unlike Outer Mongolia, Inner Mongolia contains important mineral resources, especially iron in Chahar and coal in the vicinity of Tatung; and the Japanese have attempted to exploit these mines with a view to creating their self-sufficient economic unit in east Asia. They have, however, been harassed and impeded by guerrilla warfare, in which some Mongols have participated along with the Chinese communist and nationalist forces.

Mongols, descendants of the warriors who fought under Jenghiz Khan (whose legendary grave is located in the wild Ordos region of Inner Mongolia) are scattered over a vast expanse of territory and are under many sovereignties. There are 1,500,000 or 2,000,000 in the provinces of Manchoukuo which lie to the west of the Hsingan mountains; and a smaller number are to be found in the Buryat-Mongol republic, one of the administrative subdivisions of soviet Siberia. A few are also in Sin Kiang. Their religion is Lamaism, a degenerate and superstitious form of Buddhism. As a general rule they prefer nomadic pastoral life and their homes are camps, not towns.

(W. H. CH.)

Monivong, Sisowath (1875–1941), monarch of Cambodia, French Indo-China, was born Dec. 27. King Sisowath succeeded to the Cambodian throne after the death of his father in 1927, but he ruled in name only, as real authority was vested in the French colonial administration. Like his ancestors before him, Sisowath lived in the capital city of Pnom-Penh in a walled palace where he was served by several hundred wives. But the depression penetrated the jungles of Cambodia in 1937, and the king was forced to dismiss half of his 200 wives. In ill health and depressed over the Tokyo peace negotiations of early 1941, which awarded the northwest portion of his kingdom to Thailand (Siam), King Sisowath died in his palace, April 23.

Montana. A northwestern state of the United States, popularly known as the "Treasure state." Area, 147,138 sq.mi.; pop. (1940): 559,456. The urban population was 211,535 or 37·8%. Capital, Helena (15,056). Other cities of 10,000 or more were: Butte (37,081); Great Falls (29,928); Billings (23,261); Missoula (18,449); Anaconda (11,004). Of the total population there were 540,468 whites, of whom 484,826 were native-born and 55,642 were foreign-born. The Indian population numbered 16,841.

History.—Measures passed by the legislative assembly in 1941 provided for a survey for reorganization of the state government, the reapportionment of congressional districts, changes in the social security law, and proposed changes in the state board of education.

Sam G. Ford, elected in 1940, was the first Republican governor in 20 years. Other state officials in 1941 were Ernest T. Eaton, lieutenant governor; Sam Mitchell, secretary of state; John J. Holmes, auditor; John W. Bonnor, attorney general; Elizabeth Ireland, superintendent of public instruction.

Education.—There were some 1,890 elementary schools in Montana in 1941, with an enrolment of 75,000 pupils and a teaching staff of 3,830. There were 199 high schools with an enrolment of 32,000 and 1,531 teachers. The total cost of operating these schools was approximately $15,100,000. The six units of the University of Montana had a registration of 5,252 and a teaching staff of 337, exclusive of the extension service.

Public Welfare, Charities, Correction.—Through federal and state aid, more than 26,000 persons in Montana received public assistance in 1941. Grants totalling almost $5,000,000 were distributed in 1941 as follows (figures in parentheses indicate the average number of recipients per month): Old-age assistance (12,413), $3,043,704.37; aid to dependent children (6,352), $920,991.72; aid to needy blind (263), $70,129.95; general relief (3,258), $597,208.07; medical care (874), $74,370.55; hospitalization (485), $205,935.47; burials (62), $40,303.03. Unemployment compensation benefits totalling $2,535,498 were paid to 18,373 persons, an average of $11 per month for 12.5 weeks, or $138 per claimant. Correctional institutions with their average population and total expenditures in 1941 were: Montana State prison, 508 inmates, $182,900; State Industrial school, 135 inmates, $71,729; Vocational School for Girls, 89 inmates, $48,247.

Communication.—In 1940 the state highway commission maintained 6,395 mi. of highways at a cost of $12,117,000. The railway mileage was 5,203. Three air lines served the state in 1941 and there were 20 airports and 23 emergency landing fields, including those used by the forest service.

Banking and Finance.—There were 112 banks in the state in 1941. The 42 national banks had total deposits of $90,664,704 and their total assets were $99,538,000. State banks had total assets of $86,415,362 and their deposits were $45,159,352. There were 20 savings and loan associations, with resources of $12,400,000. For the fiscal year 1940–41, the state income was $36,692,605 and the total expenditures were $37,212,366. The gross debt of the state was $9,128,725 and the net debt, $8,288,851.

Agriculture.—Favourable weather conditions and higher prices made the year 1941 the best since 1927 for Montana farmers. Crops worth $103,465,000 were harvested from 6,526,000 ac. The cash income from livestock and livestock products was $71,916,000. Government payments were $11,619,697.

Table I.—*Leading Agricultural Products of Montana, 1941 and 1940*

Crop	1941	1940
Wheat, bu.	68,239,000	51,676,000
Hay, tons	2,318,000	2,160,000
Oats, bu.	14,544,000	10,574,000
Sugar beets, tons	810,000	1,166,000
Barley, bu.	5,656,000	4,208,000
Corn, bu.	3,560,000	2,856,000
Alfalfa seed, bu.	117,000	185,000
Flaxseed, bu.	888,000	770,000
Potatoes, bu.	1,540,000	1,840,000
Seed peas, bu.	567,000	414,000

Manufacturing.—The total value of products manufactured in Montana in 1939 was $151,885,026 as compared with $176,278,814 in 1937. Persons employed in manufacturing numbered 10,898 in 1939 and were paid salaries and wages amounting to $15,832,241.

Table II.—*Principal Industries of Montana, 1939 and 1937*

Industry	Value of products	
	1939	1937
Bread and bakery products	$ 4,020,290	$ 3,733,316
Butter	4,248,762	4,130,181
Flour and other grain mill products	6,254,698	8,146,527
Liquors, malt	2,091,234	2,093,570
Lumber and timber products	7,587,327	9,922,709
Meat packing, wholesale	4,731,406	4,036,095
Petroleum refining	13,461,015	10,892,921
Sugar, beet	10,780,455	9,389,256
Printing and publishing	3,196,483	3,362,550

Mineral Production.—The 1941 production of gold, silver, copper, lead and zinc in Montana was valued at $57,433,700, an increase of 3% over that of 1940. The lead output was less than in 1940, but owing to the higher price its value was greater.

Table III.—*Principal Mineral Products of Montana, 1941 and 1940*

Mineral	Value, 1941	Value, 1940
Copper	$20,835,000	$28,564,366
Gold	8,627,500	9,541,070
Silver	8,038,400	8,790,080
Zinc	8,496,800	6,625,962
Lead	2,436,000	2,303,600
	Amount in 1940	Amount in 1939
Coal	2,974,000 tons	2,810,000 tons
Petroleum	6,768,000 bbl.	5,961,000 bbl.

Crude oil production amounted to 7,432,354 bbl. in 1941 as compared with 6,768,000 bbl. in 1940. (E. E. B.)

Montenegro. A former kingdom in the northwest Balkan peninsula, Montenegro had voted on Nov. 25, 1918 its union with Serbia in the then newly formed kingdom of the Serbs, Croats and Slovenes or Yugoslavia. At that time its area was 5,880 sq.mi. with a population est. on Jan. 1, 1917 at 436,789, all of them Serbs of the Greek Orthodox religion. The capital was Cetinje. The last king was Nicholas I, whose daughter married King Victor Emmanuel III of Italy. The occupation of the people is mainly pastoral and agricultural. As a province within Yugoslavia, Montenegro, according to the census of Jan. 1921, had an area of 3,733 sq.mi. and a population of 199,856; the density of the population was the smallest in the whole of Yugoslavia. With the redistribution of Yugoslav administration in 1930, Cetinje became the capital of the Zetska banovina or province. The population of Cetinje according to the census of March 31, 1931 was 6,367.

With the disintegration of Yugoslavia under German aggression in April 1941, the fate of Montenegro remained for a long time undetermined. The territory came under Italian military occupation, and in April Sarafino Mazzolini, former Italian minister to Egypt, was named royal Italian commissioner to Montenegro. On July 12 a constituent national assembly met at Cetinje and proclaimed the independence of the country, declaring that "the regime is abolished which was introduced in Montenegro by the former kingdom of Yugoslavia." Owing to the lack of a chief of the state, it was decided to establish a regency, and to ask the king of Italy to appoint a regent. On Oct. 27 a treaty fixing the borders between Croatia and Montenegro was signed in Zagreb by Italian and Croat officials, declaring that the border should follow roughly the ancient frontier of 1918 between Austria-Hungary on the one hand and Montenegro and Serbia on the other hand. Mount Kliunack-Glava was named as the point where the borders of Montenegro, Croatia and Serbia meet. Montenegro has only a very limited outlet to the sea, the larger part of the Montenegrin shore having been directly incorporated into Italy. (*See* also CROATIA; DALMATIA; YUGOSLAVIA.) (H. Ko.)

Montreal. A city of Canada, in the province of Quebec, situated on an island at the confluence of the Ottawa and St. Lawrence rivers, approximately 1,000 mi. from the Atlantic ocean and 2,760 mi. from Liverpool. It is at the head of ocean navigation and is the terminus of lake vessels. It is served by three canal systems: the St. Lawrence canals (1,230 mi. to the Great Lakes), the eastern United States canals, via the Richelieu river and Lake Champlain (127 mi.) and the Ottawa river canals (119 mi.). The head offices of the Canadian Pacific railway and of the Canadian National railways are situated at Montreal.

Population of the city of Montreal (census of 1931) was 810,925; of greater Montreal, including its suburbs, 973,637. In 1941, as estimated by Lovell's *Directory*, the population was: city of Montreal, 1,307,592; greater Montreal, 1,493,132. Greater Montreal is governed by a metropolitan commission, the majority of whose members are appointed by the city council, composed of 99 members.

The mayor is elected by the electors of the whole city. He is not a member of the executive committee, and is paid for his services as mayor. The council appoints from among its members six councillors to act as an executive committee.

The port of Montreal is the largest in Canada. War conditions accelerated its activity in 1941, but statistics were unavailable because of censorship.

For 1941 the amount of building permits issued stood at (new) 1,105, value $9,193,281; (repairs) 2,523, value $3,354,001. Bank deposits (for 11 months ended Nov. 30, 1941) $8,926,762,706, and bank clearings (for 12 months ended Dec. 31, 1941) $5,871,146,000. The assessed value of real estate was $1,255,702,054. (J. A. MA.)

Moran, (John) Léon (1864–1941), U.S. artist, son of Edward Moran (1829–1901), famous U.S. marine painter, was born Oct. 4 in Philadelphia, Pa. He studied art with his father and later attended the National Academy of Design in New York and art schools in London and Paris. In 1904 he won the gold medal of the American Art society in Philadelphia and later won the gold medal of the Philadelphia Art club. He died in Plainfield, N.J., Aug. 4.

Moravia: *see* BOHEMIA AND MORAVIA.

Morgan, Helen (1900?–1941), U.S. "blues" singer of radio, screen and stage, was born in Danville, Ill. After working in a biscuit factory and as a manicurist, she got a job in a Chicago cabaret, where she was discovered by a Ziegfeld talent scout who put her to work in the chorus of *Sally* in 1920. In 1923 she won a Canadian beauty contest and in 1927 she made her first hit in Ziegfeld's *Show Boat*. From then on, her star rose swiftly in the entertainment world. She specialized in singing "blues" songs while sitting on a piano, a stunt that attracted wide attention and won her many stage and vaudeville bookings. Miss Morgan died in Chicago, Oct. 8.

Mormons. The church intensified, during the year 1941, its welfare program. Budgets of production were issued for the year 1942, based upon surveys as to the probable number of persons, employables and unemployables, aged and infirm, who might need assistance in 1942–43. The interexchange of commodities between different sections of the church was intensified and perfected, so that, for example, salmon from Oregon was exchanged for citrus fruits from Arizona; and so for other commodities.

During the year the church carried on an extensive building program of chapels and amusement halls, not alone in the thickly populated areas of the church, but in the mission fields where a number of good, but modest meetinghouses were built. Work was pushed forward on the Temple at Idaho Falls, Ida., which it was planned to complete during the year 1942.

The increasing work of supervising the stakes and missions of the church made necessary the appointing of five assistants to the Council of the Twelve Apostles. These men were appointed for life. The immediate work given to them had to do with the welfare program and with the building up of the priesthood organizations of the church. Every male member of the church

over 12 years of age holds some rank of the priesthood, which has two general divisions: the Aaronic, or Lesser Priesthood, filled normally by boys from 12 to 18 years of age; and the Melchizedek, or Higher Priesthood, which embraces the balance of the male population of the church.

Upon the outbreak of World War II the American missionaries of the church in war areas were called home. During the year 1941, the missionaries from Australasia and the Pacific isles were also called back to the mainland of the United States, but those in the Americas remained there. The foreign missions were left in charge of the local priesthood and the work was carried forward with much activity and gratifying results, both as to new converts and general church activities. (*See* also CHURCH MEMBERSHIP.) (J. R. CL.)

Mortgages, Home: *see* FEDERAL HOUSING ADMINISTRATION; HOME OWNERS' LOAN CORPORATION.

Mosca, Gaetano (1858–1941), Italian statesman and historian, was born April 1 in Palermo, Italy. An outstanding authority on political science, Mosca was named to the senate in 1919. He was undersecretary of state for colonies, 1914–16, and professor of the history of political doctrines at the University of Rome, 1924–33. Senator Mosca, who held in his teachings that democracy is the best political structure, shunned politics during the fascist regime and was never molested. His best known works are: *Elementi di Scienza Politica* (1896), translated into English in 1939 as *The Ruling Class*, and *History of Political Doctrines* (1937). He died in Rome, Nov. 9.

Moscow. Apart from being the capital of the Union of Soviet Socialist Republics (*q.v.*), and the Russian Soviet Federated Socialist Republic, Moscow is also the administrative centre of the most important industrial area of the U.S.S.R., Moscow Region, which comprises 42 towns, 2,075 rural administrative centres and 68 industrial settlements, with a population of 8,918,389 inhabitants, of which 6,268,331 were living in towns. The population of Moscow itself comprised 4,137,000 inhabitants in 1939.

In 1939 the industrial output of Moscow itself amounted to 16·4% of the industrial output of the country, and Moscow and Moscow Region produced 31·7% of the electric power of the U.S.S.R. In 1939 the electric power station of Moscow itself produced 6,785,500 kw. Nearly half (44% in 1939) of the total output of Moscow industries is the production of the metal industry, which comprises automobiles, machine engineering, electrical engineering, precision tools, radio, etc., as well as war industries; many important chemical factories are situated in Moscow as well as numerous textile factories.

Municipal transport in 1939 comprised 2,405 trams, 272 underground coaches, 486 trolley buses and 1,197 buses. In 1939, 2,570,000,000 passengers were carried, of whom the underground carried 331,800,000 persons. In 1938 the second part of the Metro railway was put in operation, connecting the following: Sokolniki, Komsomolskaya Ploshiad, Park Kultury, Kurskiy, Kievskiy station, Beloruskiy station, Stadium Dinamo, Sobarb Sokol. The third part of the Metro was still under construction in 1941, and it was expected that this part would be put into operation in 1942. In 1935 the soviet government approved a ten-year plan for the reconstruction of Moscow, according to which the area of Moscow would be extended from 63,000 to 148,000 ac.; but the population was to be limited to 5,000,000. The available data show that during 1936–41 a great deal of reconstruction was accomplished. The construction of the Moscow-Volga canal was, on the whole, completed in 1941. The northern port was finished and in use; the southern port was still under construction. During 1936–38 five new bridges were constructed over the Moscow river (Krymskiy, Kamenniy, Moskvorecskiy, Krasnokholmskiy and Ukhtinskiy) and two old ones were reconstructed; also three bridges were built across the canal and one across the Yausa river. The building of houses, however, was carried out at a much smaller rate than that planned.

In 1939, of the 620,000 school children, more than 70% attended new or reconstructed schools. In that year there were 82 higher educational institutions registering 95,000 students; 768 large libraries were in use with 11,300,000 volumes; 438 outpatient hospitals were in use (in 1913 there were only 50), as well as 150 hospitals with 36,300 beds (in 1913 there were 10,600 beds), 34 maternity hospitals with 4,458 beds, 390 crêches with 38,400 cots.

German Campaign on the Moscow Front.—The central German army under the command of Marshal Fedor von Bock (*q.v.*) began its supreme effort early in October to encircle and capture Moscow. The advance was rapid during the first several weeks, and the U.S.S.R. transferred many of its administrative offices to the provisional capital of Kuibyshev (*q.v.*). Between Dec. 1 and Dec. 4 the Germans made their closest approach to Moscow, near Golitzi on the Minsk-Moscow road, only some 20 mi. west of the capital. Then the Russians began a series of counterattacks that threw the enemy back of the Moscow and Nara rivers. A military spokesman in Berlin announced on Dec. 8 that the German high command had abandoned the plan to take Moscow before the end of the year and would assume purely defensive tactics for the rest of the winter. But the Russians, pressing the attack, continued to drive the Germans back, and by the middle of December announced that the threat to Moscow was definitely removed. British and U.S. news correspondents returned from Kuibyshev. They reported that, although the population of Moscow was only a quarter of normal, public utilities were operating as usual. The Kremlin and the business district along Gorki street had not been damaged by air raids, but the Bolshoi theatre and Moscow university were partly demolished. For an account of the war on the central Russian front, *see* WORLD WAR II. (A. M. BV.; X.)

Motion Pictures. A dim outline of what the government expected from the industry in the way of war service had begun to emerge before the close of 1941. It was apparent that heavy demands would be made upon the studios not only for specialized technicians and craftsmen, but also for literary and executive talent. It was likewise apparent that the government expected the industry to contribute strongly to national morale by means of unimpeded picture production.

The year 1941 was, generally speaking, up to the time of outbreak of hostilities, a period of mounting box office receipts and of mounting uncertainty. The industry found itself harassed by political attack and confronted with problems of increased taxation and labour demands. There loomed the additional problem of obtaining needed operational materials under the priorities system of the national defense program.

Anyone leafing over the files of the motion picture trade press might learn how often "panic sweeps industry." World War II, however, brought problems beside which the competition of bowling alleys or night baseball, or the moral criticism of midwestern women's clubs, seemed feather-light.

The loss of most of its foreign market resulted in a somewhat

emaciated but leaner, harder, sturdier industry. It had to plow its home fields, instead of following mirages abroad. Thus its two great prewar trials of 1941—the senatorial investigation of asserted motion picture "war mongering," and the labour racketeering situation—found the industry not only taking a firm defensive stand, but actually an aggressive position.

The closing months of 1941 saw motion picture stocks increased in value and most companies generally reporting improved financial conditions.

A striking example of industry gains was afforded by the report of Twentieth Century-Fox showing a consolidated net profit of $1,549,164 for the 39 weeks ending Sept. 27, 1941, as compared to a net loss of $1,075,611 for the comparative period of 1940. Much of this improvement, but not all, could be attributed to the impetus given by the defense program.

As estimated by the Motion Picture Producers and Distributors, Inc., the capital investment of the industry in 1941 was:

Theatres	$1,900,000,000
Studios	125,000,000
Distribution	25,000,000
	$2,050,000,000

An estimated 280,000 persons were employed in the production, exhibition and distribution branches of the industry, carrying a pay roll of approximately $400,000,000.

Taxes paid to state and local governments were estimated at $250,000,000. Federal taxes were estimated to exceed $100,000,000. On the basis of unofficial figures, box office returns in 1941 were in the neighbourhood of $1,000,000,000. Estimated weekly attendance was 80,000,000.

From the standpoint of public interest, the outstanding event of the year was the senatorial investigation of the industry on a charge of "war mongering." For a considerable time, leading noninterventionists had been accusing the industry of producing pictures designed to heighten American antagonism toward the axis powers, thus supposedly bringing the United States closer to actual entry into the war. Viewed objectively, the senatorial investigation of the film business was one of those ironic occurrences peculiar to democracies. For the industry's viewpoint was that of the administration of President Franklin D. Roosevelt—himself under fire at the time on similar accusations.

This situation came to a climax with the appointment by Senator Burton K. Wheeler, then a leading noninterventionist heading the senate interstate commerce committee, of a subcommittee whose majority membership entertained similar views.

This committee, it was stated, was not to conduct a trial, but to serve rather as a grand jury to determine if an investigation should be made by the senate. It was ruled that Wendell L. Willkie, Republican presidential candidate in 1940, who had been retained as special counsel by the industry, could not cross-examine the witnesses summoned. Thus Willkie's role was limited to expression of his viewpoint in letters, and in statements to the press. In a letter to Senator D. Worth Clark, chairman of the subcommittee, Willkie sounded the keynote of the industry's position, saying:

> On behalf of the motion picture industry and its personnel, I wish to put on the record this simple truth: We make no pretense of friendliness to nazi Germany nor to the objectives and goals of this ruthless dictatorship. We abhor everything which Hitler represents.

The start of the hearings in September found the industry troubled with grave misgivings. It was feared that the mere charge of propaganda, whether or not sustained, would, in the overheated American atmosphere, have an adverse effect on the box office.

Among the industry leaders who testified were: Nicholas M. Schenck, president of Loew's Inc. (Metro-Goldwyn-Mayer); Darryl F. Zanuck, vice-president in charge of production at Twentieth Century-Fox; Harry M. Warner, president of Warner Brothers; and Barney Balaban, president of Paramount.

In general, they denied emphatically any conspiracy to "pump war propaganda to the public" and maintained that the production of films dealing with topical subjects was a public duty.

It was not difficult to estimate the immediate results. The noninterventionist section of the populace endorsed the inquiry. The so-called interventionists supported the position of the industry. There was some belief that box office business was stimulated. Yet in some quarters there was regret that such strong feeling had been aroused. Actual war, however, put an end to all speculation.

Second only to the senate investigation in public interest was the trial in a New York federal court of George E. Browne and William Bioff, president and Pacific coast representative, respectively, of the International Alliance of Theatrical Stage Employees. They were accused of extorting $550,000 from four major studios.

Prominent studio executives testified that they had turned over large sums under threats of strikes that would disrupt the entire industry. Both defendants were convicted. Browne was sentenced to eight years and a $20,000 fine, and Bioff to ten years and a $20,000 fine. Both appealed.

Up to the outbreak of the war, the year was an agitated one so far as labour relations were concerned, as is natural in a period of rising prices. There were many wage increases, and in some situations an actual shortage of skilled artisans due to defense activity.

Only one major strike developed, that of the Screen Cartoonists guild at the Walt Disney studios, and the world beheld the strange sight of picket standards at the home of Donald Duck and Mickey Mouse. The two-month strike resulted in a closed-shop agreement.

The plight of the extra players, whose earnings had fallen off $500,000 in 1940, remained one of the sociological problems of the industry.

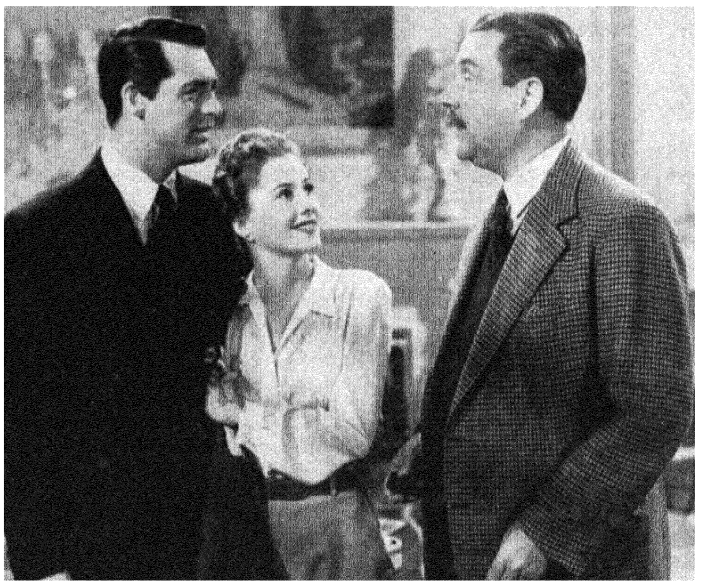
In the field of motion picture production there was a strong trend toward comedy as was evidenced by the sensational success of the team of Bud Abbott and Lou Costello and the greatly increased popularity of Bob Hope. Abbott and Costello were easily the outstanding newcomers of the year, and their three pictures, *Buck Privates, Hold That Ghost* and *Keep 'Em Flying* brought added revenue into Universal's treasury.

Another trend was toward musicals, and statistics show that there were more elaborate and expensive productions of this type made in 1941 than in any previous year.

Pictures with American themes kept pace with the growth of the national emergency. The number of anti-nazi war pictures definitely diminished during 1941. In fact, no picture with an anti-nazi theme had placed among the leading money makers, up to the coming of war. Under conditions of actual war, however, the studios began preparing a flood of pictures with war backgrounds. The box office sensation of the year was Warner's *Sergeant York,* the life story of the great American hero of World War I.

The three newcomers who received the most publicity were Rita Hayworth, Gene Tierney and Veronica Lake.

Preoccupation with Latin America, both from the good neighbour and good business standpoints, continued. A number of Latin-American pictures put out by Hollywood studios revolved around glamorous night life themes and were resented by the peoples of the regions depicted as giving a false impression of their habits and customs. Hollywood, however, through the employment of technical advisers, showed an eagerness to learn. The desire of Hollywood to make friends with the Latin-American neighbours was manifested in the good will tours, first to Mexico in April, and later to South America. The Mexican expedition headed by John



Above, left: CARY GRANT, Joan Fontaine and Nigel Bruce in *Suspicion*. Miss Fontaine received the 1941 Academy award as the best actress of the year for her work in this picture

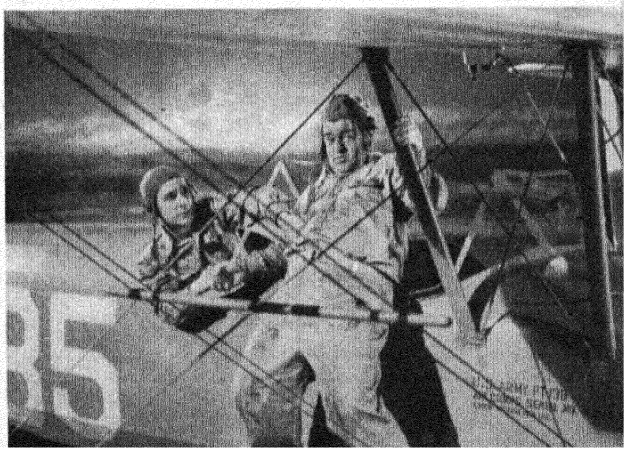
Above, right: ORSON WELLES (centre) in *Citizen Kane*, which received the 1941 Academy award as the best original screen play

Upper centre: THE 1941 ACADEMY AWARD for best supporting actor went to Donald Crisp (centre) for his work in *How Green Was My Valley*. This picture was also voted the Academy award as the outstanding picture of 1941

Lower centre: MARY ASTOR (left) was voted the Academy award for the best supporting actress of 1941, for her role as Sandra in *The Great Lie*, with George Brent and Bette Davis

Below, left: GARY COOPER (front) and George Tobias in *Sergeant York*. For his part in this picture, Cooper received the 1941 Academy award as the outstanding actor of the year

Below, right: BUD ABBOTT AND LOU COSTELLO in *Keep 'Em Flying*, a comedy team which achieved outstanding popularity during 1941



Hay Whitney, head of the division for better American relations, included Norma Shearer, Mickey Rooney, Kay Francis, Laurel and Hardy, Wallace Beery, Frank Morgan and leading motion picture writers and critics from all over the United States. They were greeted by several hundred thousand Mexicans and received by the president of the republic.

Douglas Fairbanks, Jr., who was selected by President Roosevelt and Secretary of State Cordell Hull, visited Brazil and the Argentine as a good will ambassador. Walt Disney, accompanied by his technicians and a complete staff, toured the Latin-American countries. Bing Crosby and John Hay Whitney were others who were enthusiastically received by the Latin Americans.

Prospects of obtaining material and supplies needed for production were uncertain at the year's end. It was generally recognized that motion pictures were essential to national morale and the industry was assured by the government that everything would be done to keep production unimpaired.

However, the closing months of the year found a number of shortages reported. In an industry whose requirements may range from lions to lumber, it was naturally impossible to read the future with any certainty.

Outside of a growing number of pictures, both features and short subjects, dealing with war and defense topics, the war atmosphere was variously reflected. The industry was called upon to play a leading role in supplying entertainment to the armed forces, and many stars made radio and camp appearances. As a community, Hollywood led the nation in its contribution to the United Service Organizations, and the nation's motion picture theatres conducted a United Service Organizations fund-raising campaign that passed the $1,000,000 mark.

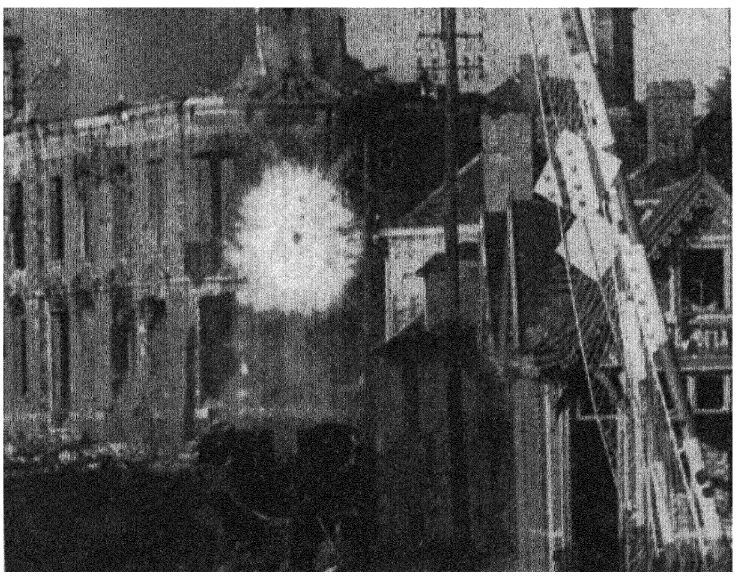
A feature of the industry's role in war preparation was an extensive army training film program, the studios and guilds participating without profit. This program was in charge of Darryl F. Zanuck of Twentieth Century-Fox, who had been appointed a lieutenant colonel in the army signal corps.

Of the members of the industry in uniform, Actor James Stewart, called under the selective service draft, attracted the most public attention.

Director Garson Kanin also was called, taking a government defense post upon his discharge. Calling up of reserve officers also drew upon the industry.

Robert Montgomery, who had performed ambulance service in France at the time of the nazi invasion, was an officer in the navy. Others in service included Director John Ford, Producer Gene Markey and actors Douglas Fairbanks, Jr., Wayne Morris and Stirling Hayden.

"SIEG IM WESTEN" (*Victory in the West*), a German war film, released Jan. 31, 1941 in Berlin, catches a remarkable view of a nazi assault gun firing point-blank into a building defended by French troops at Hangest, south of the Somme river



The so-called consent decree, which became operative in September, provided for revolutionary changes in the method of selling pictures. It abolished "block booking," by which a year's program had been sold in advance, and limited picture sales to maximum blocks of five, after regional trade showings to exhibitors.

At the end of the year 1941, the success of the new system was still conjectural. Early trade showings found only meagre audiences of exhibitors in attendance. Minnesota passed a state law at complete variance with the provisions of the consent decree, and the situation had to be taken into federal court.

Supporters of the consent decree maintained that under it studios were concentrating on the individual production of superior pictures, and showing a tendency toward the gradual elimination of the cheap, run-of-mine films.

Joe Breen, after long services as head of the Production Code of the Hays office, dealing with the morality of pictures, left his post to accept an executive position at the R.K.O. studios.

The year saw a further diminution in the importation of noteworthy foreign pictures.

Outstanding were the English *Target For Tonight, The Stars Look Down* and *Ku Kan,* a documentary film of the Chinese War. George Bernard Shaw's *Major Barbara* was shown, but fell far short of the popularity of the same author's *Pygmalion.* Academy awards for 1940 were announced at the organization's annual dinner on Feb. 27, 1941.

Awards.—Most outstanding picture of 1940, *Rebecca,* Selznick-International-United Artists; best performance by an actor, James Stewart in *The Philadelphia Story,* M-G-M; best performance by an actress, Ginger Rogers, *Kitty Foyle,* R.K.O.; best performance by an actor in a supporting role, Walter Brennan in *The Westerner,* Samuel Goldwyn-United Artists; best performance by an actress in a supporting role, Jane Darwell in *Grapes of Wrath,* Twentieth Century-Fox; best achievement in directing, John Ford for *Grapes of Wrath,* Twentieth Century-Fox; best original motion picture story, Benjamin Glazer and John S. Toldy (pen name) for *Arise, My Love,* Paramount; best written screen play, Donald Ogden Stewart for *The Philadelphia Story,* M-G-M; best original screen play, Preston Sturges for *The Great McGinty,* Paramount; best achievement in art direction (black-and-white films), Cedric Gibbons and Paul Groesse for *Pride and Prejudice,* M-G-M; best achievement in art direction (colour films), Vincent Korda for *The Thief of Bagdad,* Alexander Korda-United Artists; best achievement in cinematography (black-and-white), George Barnes for *Rebecca,* Selznick-International-United Artists; best achievement in cinematography (colour), George Perinal for *The Thief of Bagdad,* Alexander Korda-United Artists; best achievement in sound recording, Douglas Shearer for *Strike Up the Band,* M-G-M (Erpi); best achievement in film editing, Anne Bauchons for *North West Mounted Police,* Paramount; short subjects, cartoons, *Milky Way,* Rudolph Ising-M-G-M; short subjects, one reel, *Quicker 'n a Wink,* Pete Smith-M-G-M; short subjects, two reel, *Teddy, the Rough Rider,* Gordon Hollingshead-Warner Brothers; special effects, *The Thief of Bagdad,* Lawrence Butler, photographic and Jack Whitney, sound; special award for service to the humanities, Bob Hope; special award for co-operation with the U.S. army, Major Nathan Levinson; best song, "When You Wish Upon a Star" (*Pinocchio*), lyrics by Ned Washington, music by Leigh Harline; best musical score, *Pinocchio,* Ned Washington, Paul Smith, Leigh Harline; best musical scoring, Alfred Newman for *Tin Pan Alley;* technical achievement, Daniel Clar, Grover Laube, Charles Miller, Robert W. Stevens, all Twentieth Century-Fox, for silenced camera. (*See* page 445 for 1941 Academy awards.)

The *Motion Picture Herald* poll listed the ten biggest money-making stars of 1941. For the third time Mickey Rooney headed the list. The others named in order were: Clark Gable, Abbott and Costello, Bob Hope, Spencer Tracy, Gene Autry, Gary Cooper, Bette Davis, James Cagney and Judy Garland.

The outstanding pictures of 1941 included *Sergeant York, Hold Back the Dawn, The Little Foxes, Blossoms in the Dust, Caught in the Draft, Dumbo, How Green Was My Valley, All That Money Can Buy, Meet John Doe, Men of Boys' Town, Tom, Dick and Harry, That Hamilton Woman, Penny Serenade, Week-End in Havana, The Lady Eve, Here Comes Mr. Jordan, Unfinished Business, Lydia, Andy Hardy's Private Secretary, The Maltese Falcon, Man Hunt, The Reluctant Dragon, They Died With Their Boots On, Cheers for Miss Bishop, Whistling in the Dark, Ball of Fire.*

(L. O. P.)

The development of new and improved types of studio and theatre equipment during 1941 was materially retarded by restrictions imposed upon availability of materials by the requirements of national defense preparations. The principal accomplishments, therefore, were more in the nature of improvements, rather than new developments, of both equipment and processes.

Optics.—Further work on the evaporation method of depositing anti-reflection coatings resulted in the production of lens coatings of more accurately controlled thickness and of greater durability than had heretofore

been available. The RCA "Magicote" process resulted in the production of baked coatings which were mildly acid and alkali proof, and applicable to all types of lens systems. These coatings are of such hardness and durability that they are not injured by repeated cleaning, and may, therefore, be applied to both inner and outer lens surfaces without risk of subsequent deterioration of the coatings due to normal usage of the lens equipment.

Film.—Fine grain positive film for release prints, first introduced in 1940, was being generally adopted by the industry during the year 1941, Paramount having made all release prints on fine grain stock since March of 1941, and both Warners and M-G-M printing a portion of their release on this type of film shortly thereafter. Prints on the new fine grain stocks are characterized by improved rendition of fine detail, a marked reduction in visibility of grain pattern on the screen, apparently increased shadow definition, smoother gradations in picture half tones, and a perceptible reduction in the reproduced film ground noise of the associated sound track. Sound track print density latitude for acceptable cross-modulation is approximately double that of previously employed print stocks.

Fine grain sound negative stocks especially designed for variable density recording systems were introduced during the year, and were gradually adopted because of the improved resolution and reduced level of film background noise obtained from these films as contrasted with previously used emulsions.

A new direct reading precision photoelectric densitometer was introduced to the industry during 1941 by Electrical Research Products, Inc., and enjoyed notable acceptance in motion picture laboratories of the United States. This instrument, which is of the integrating sphere type, has a working density range of from zero to three, and may be adjusted to read either visual diffuse or effective printing densities.

An automatic negative cleaning machine was developed by Warner Bros. which eliminates all hand operations in the cleaning of motion-picture negative film. Warner Bros. also developed a mild steel alloy staple for joining lengths of film being fed through the developing machines. These staples replace the previously used, more expensive, stainless steel staples, which were in 1941 quite difficult to obtain.

Sound.—A new high-speed volume-limiting amplifier introduced by Electrical Research Products, Inc. found wide acceptance among the studios employing variable density recording. This device serves to prevent momentary sound track overloading due to high-peak signal levels, and thus makes possible higher quality recording without a reduction in average recording level. Variable area recording channels continued to employ electronic volume compression in both original and release recordings to achieve the same purpose.

M-G-M adopted the use of a special cylindrical objective in their recording machines which results in a recording slit image height of only two ten thousandths of an inch. Reduction of slit image height to this value resulted in the practical elimination of distortion caused by the light valve ribbon velocity effect, and made possible adoption of the RMA 100 microsecond standard pre-equalization curve on all original recording circuits. Such recordings are reproduced with appropriate post-equalization and result in somewhat improved signal-to-noise ratio as compared with unequalized recordings. Re-recordings made for release printing must, of course, employ a recording circuit of normal frequency characteristic.

The use of negative feedback to eliminate resonance in the Western Electric light valve was generally adopted in variable density recording systems to secure improved quality of recording in the high-frequency region of the audio spectrum.

Lighting.—The widespread adoption of high-speed picture negative stocks resulted in a trend toward greatly reduced values of motion-picture set lighting intensities. This, in turn, was followed by the general use of smaller lighting units, and permitted balancing of set lighting to be accomplished by means of dimmers on individual lamps rather than by moving of lamp units and increasing or decreasing the number of lighting units employed. This form of light-balance control was being experimentally applied to arc lamps and overhead lighting, as well as to floor units, and should effect considerable economy in picture production.

A pronounced trend toward the use of incandescent lamps in technicolor productions was noted. When employed for colour photography, the incandescent lamps are operated at higher-than-normal voltage, and then screened to appropriate quality with blue filters.

A new 13.6 mm. high-intensity projector carbon was introduced by the National Carbon company for use in both process photography background projectors and large theatre projectors. The new carbon, which operates in the current range between 125 and 150 amperes, delivers a slightly higher crater candle power at 150 amperes than the super high-intensity carbon, previously developed by National, delivers at 180 amperes. Compared with regular 125 ampere carbons, the new carbon working at 150 amperes delivers from 28 to 47% more screen light, depending upon the type of optical system employed. In addition, the new carbon has greater latitude in relative carbon positions at which steady burning may be attained, is more resistant to both thermal and mechanical shock, and operates at a consumption rate only slightly more than one-half that of super high-intensity carbon.

Colour.—The year 1941 witnessed the use of 16 mm. kodachrome film in place of the more expensive 35 mm. technicolor negative for the production of a number of short subjects in colour at Warner Bros. The original negative is produced on standard 16 mm. kodachrome, is then processed at the Eastman plant in Rochester, N.Y., and held at that point until negative cutting is completed. A black-and-white reversal print is forwarded from Eastman to the producer for purpose of editing; after completion of this process the original kodachrome is cut to match the edited black-and-white print. The kodachrome film is then sent to technicolor for production of the necessary separation negatives on 35 mm. film, and subsequent 35 mm. technicolor prints for general release.

Large savings in production cost become possible through this use of 16 mm. film. It also becomes feasible to photograph many subjects whose inaccessibility has heretofore rendered photography with the heavier and more bulky 35 mm. equipment impracticable. These advantages are not sufficiently great, however, to offset the much greater latitude and control offered by the standard technicolor process for the production of feature length pictures. For the time being, therefore, the use of 16 mm. kodachrome in studio production activities must be viewed as a valuable adjunct to normal colour work rather than as a substitute for the more versatile, even though more costly, technicolor process.

Theatre equipment.—The new model Brenkert and Century picture heads made available to theatre operators the highly efficient double rear shutter type of projector mechanism, with a resulting screen light intensity increase of 25 to 30% over that obtained with single shutter heads, or an increase of approximately 15% over that obtained from heads employing front and back shutters. The Brenkert head features sealed unit construction of unusual sturdiness, self lubrication, concentric shutter shafts, and separate drives for the intermittent and shutter mechanisms. A mechanical fuse is incorporated in the main gear drive shaft to avoid shearing of gears in the event of freezing of any portion of the driven gear system.

The application of ultraviolet or "black light" in conjunction with fluorescent tapestries and carpeting for both artistic and utilitarian purposes was noted in a large number of theatres during the year. Condenser type lighting units were being generally adopted in an effort to prevent unnecessary scattering of the ultra-violet radiation, and resultant interference with the vision of theatre patrons wearing eyeglasses.

RCA made available a new type of theatre screen known as the "Magic Screen," which consists of a layer of wood pulp, bleached to a dead white, on a suitable cloth backing. This screen is not susceptible to discolourization by oxidation of its surface, and, being very thin, transmits sound approximately 12% better than normal screens of equal light-reflecting power. The cost of the new screen is about one-third that of present standard screens of equal size. (*See* also PHOTOGRAPHY.) (N. LN.)

Motor-Boat Racing.

Probably the most significant feature of the 1941 motor-boat racing season was the complete breakdown of competition in the famous Gold Cup event which, for 37 years, had been the blue ribbon contest of the field. In recent years a real race had been more the exception than the rule. But an all-time low was reached in 1941 when only one boat, Zalmon G. Simmons's "My Sin" appeared at Red Bank, N.J., for the Gold Cup championship. "My Sin," which had won the cup in 1939 in a real battle, took it in 1941 merely by cruising through a single 30-mi. heat at half speed.

There was no other big boat racing as it used to be known. But the series of regattas for the 225-, 135- and 91-cu.in. hydroplanes, the runabout classes and outboards were well attended and produced close competition and many new speed records. The 225's continued much the fastest and most popular of these classes, with honours quite evenly divided among three or four consistent topnotchers. The National Sweepstakes title, which has in recent years been almost exclusively a "225" event, was taken by George Schrafft's "Chrissie IV." Joseph J. Taggart's "Tommyan III" at the same regatta won the national championship of that class. Jack Cooper, the Kansas City veteran, won his share of contests with "Tops." Cooper was also a leading contender in the 91-cu.in. class in 1941, winning the national championship and setting a new speed record of 53·129 m.p.h.

The National Outboard championship, held at Austin, Tex., in 1941, brought out 11 entries from 24 states. Seven new champions were crowned with Paul Wearly, of Muncie, Ind., the outstanding performer, taking the professional titles in both Class A and Class B. (H. L. ST.)

Motor Transportation.

The common carrier motor bus industry comprises two main operating groups, those companies offering intercity or long-haul service and those engaged in purely local service within the limits of a single city and its adjoining suburban areas. A common carrier is defined as one that operates between fixed termini at a fixed rate of fare. Such operation usually is protected by a franchise granted by a regulatory body. The long-haul common carriers divide roughly into companies operating within the boundaries of one state, known as intrastate carriers, and interstate carriers, which are licensed to operate across state boundary lines.

All types of common carriers are closely regulated, either by state, federal or municipal agencies, and in some cases by all three. Interstate highway carriers have been under federal regulation since 1935. The body charged with this responsibility is known as the Motor Carrier bureau and is a division of the Interstate Commerce commission. Intrastate carriers, those operating solely within the boundaries of a state, have long been under the regulation of their respective state governments.

The fundamental provisions of both federal and state regulation are similar. In addition to the granting of operating certificates, or franchises, regulation also covers insurance requirements; measures designed to promote safety, such as equipment specifications; a standard accounting classification; the filing of tariffs, and compliance with the rates filed in those tariffs. These were the major provisions of motor carrier regulation in 1941, with variations peculiar to the various states or localities. City or local carriers usually are regulated in a somewhat similar manner by the governing bodies of the cities or municipalities in which they operate.

Buses.—The common carrier motor bus industry in 1941 represented an investment of approximately $310,000,000 for rolling stock, and $240,000,000 for terminals, garages and maintenance equipment. This does not include a valuation for franchise rights, which under many state laws cannot be capitalized. Taxes directly assignable to operation were $53,535,000 during 1941, exclusive of income taxes and excess profit taxes. The actual size of the common carrier bus industry is indicated by the following statistics from the magazine *Bus Transportation*.

At the close of 1941 there were 3,560 common carrier bus operating companies in the United States. Of these, 900 companies were operating in city and suburban service, 2,200 were in intercity and long-haul service and 460 in sightseeing and charter-hire operation. These companies jointly owned 57,580 buses, divided 36,900 in city and suburban service, 18,100 in intercity and long-haul service and 2,580 in sightseeing and charter-hire service. Jointly they operated regular routes over 361,000 mi. of highway, of which 30,000 mi. was in city and suburban service and 331,000 mi. in intercity and long-haul service.

Motor bus revenue for 1941 amounted to $529,199,000, divided $302,322,000 for city and suburban carriers, $218,377,000 for intercity carriers and $8,500,000 for sightseeing and miscellaneous operation. Passengers carried by buses in 1941 reached the astounding total of 4,794,956,000. Of these 433,845,000 were intercity passengers, 3,500,000 were sightseers and 4,357,611,000 were city and suburban riders.

The years from 1940 on had seen an ever-quickening changeover from street railway to bus operation in cities. The records show that over 723 cities having a population of more than 10,000 were in 1941 served entirely by buses. (There are 1,077 cities in this population group.) Steam railroads had gone in heavily for motor bus operation. Fifty-two railroads in 1941 owned 1,759 buses, while in addition, many steam railroad companies held substantial stock ownership in motor bus operating companies and thus were directly interested in motor bus transportation.

Most significant among motor bus developments were the services rendered by the industry first in connection with the defense program and war. So vital did the government consider these services that the motor bus manufacturers were granted an A-3 priority rating.

One of the biggest responsibilities of the bus industry was to assure adequate transportation of workers to and from plants and factories, and for those who had to shift around the country to new scenes of employment. These purely public-carrier services were expected to become of increasing importance with the restrictions on the use of private automobiles.

Buses were likewise shouldering a number of purely military responsibilities. For example, the selective service system used buses on a large scale for shuttling drafted men to and from examination and induction points, while the army itself on several occasions used commercial buses for carrying troops during actual military manoeuvres. The carrying of army, navy and other military personnel during furloughs, and for the transfer of men between posts and bases, likewise was affording the industry a significant opportunity to perform essential wartime services. Should the evacuation of certain areas become necessary, or should it be necessary to transport large army forces across the country with the utmost speed, the industry, with its vast available pool of equipment and trained personnel would be ideally fitted to shoulder that responsibility, and plans were being laid against such eventualities.

Still another phase of the motor bus industry is represented by the operators of noncommon-carrier service. These are companies or individuals not operating between fixed termini, service being rendered under contract, or on a charter-hire basis. In this group are buses owned and operated by hotels, apartment houses, department stores, etc., passenger service being rendered in connection with these enterprises but not directly for profit. By far the largest group in the noncommon-carrier field are the buses operated in connection with public and private schools. While school bus operation is not a source of large revenue—since much of the equipment is school-owned and the balance operated under relatively low-priced contracts—it does represent a highly important phase of the nation's educational system, and a reserve of equipment that could be called upon in case of need. Approximately 44,750 schools used buses in 1941 to carry pupils to and from their classes, utilizing 87,400 buses. Children carried daily in this service totalled 4,142,000 in 1941, at a cost of $79,155,000. There were 1,281,000 mi. of school bus route.

Trucks.—In size the motor truck industry far exceeds the bus field, and there are many ramifications of the types of service operated. Trucks are used not only by cartage companies in cities and by long-distance haulers, but by private businesses as a part of their service to customers. The 1930 census by the Automobile Manufacturers' association shows, for instance, that there were 997,033 trucks on farms alone. This same census showed 4,320,829 trucks of all types were licensed during the year 1939, a vast reservoir of equipment which takes on the highest significance in the light of war needs.

The large truck fleets are owned mostly by private shippers. On June 1, 1939 the Bell Telephone company, for instance, operated 16,210 trucks; Standard Oil of New Jersey, 12,000; the Railway Express agency, 9,960. According to compilations of the Automobile Manufacturers' association 31 private companies operated more than 1,000 trucks apiece, while approximately 1,000 companies operated truck fleets ranging all the way from 100 to 1,000 trucks apiece. These figures do not include tractors, trailers or cars owned by these companies. In 1939 there were 1,180,411 trailers registered in the U.S.

Railroad use of motor trucks is rapidly expanding. In 1925 a total of only 900 trucks were used in railroad service. By the end of 1939 this had grown to approximately 65,500 trucks in railroad use. This includes terminal transfer service, intercity service, and store-door delivery. Another 230,375 motor trucks were owned by federal, state and local governmental departments. A highly significant sidelight on the use of motor trucks was offered by a study of the U.S. bureau of public roads which in May 1939 reported that 80% of all trips by motor truck are under 20 mi. in length. According to another government survey 60% of all common carrier truckers travel less than 100 mi. per trip.

The trucking industry in 1941 gave employment to more than

3,650,000 drivers, with an uncounted number of freight handlers, mechanics and helpers. It is closely regulated in every state as to

Table I.—*Distribution of Motor Truck Fleets by Industries in the U.S.*
(Source: Chilton Company)

As of February, 1941	Fleets of 8 or More Trucks	
	Fleets Number	Trucks Number
Bakeries, Candies, Florists	1,485	62,342
Bottlers, Breweries	930	24,046
Coal Dealers, Mineral Mines	1,041	18,297
Contractors, Builders	2,457	50,775
Dairy Products, Milk, Ice Cream	1,485	62,553
Department Stores, Furniture	417	11,020
Express, Hauling, Inter & Intra State	5,301	176,313
Flour, Feed, Grains	143	3,433
Government, State, County, Municipal	2,000	239,902
Ice Dealers, Manufacturers	575	15,011
Laundries, Cleaners, Dyers	1,556	34,766
Manufacturers, Steel Mills	837	15,624
Meats, Fish	670	17,489
Newspapers, Publishers	137	4,088
Oil, Gasoline, Greases	1,224	75,045
Paints, Chemicals, Drugs	170	3,723
Public Utilities, Railroads	1,210	79,545
Vegetables, Farmers, Chain Stores	1,517	30,769
Miscellaneous	1,059	23,851
Totals	24,214	957,592

These fleets operate, in addition, over 500,000 passenger cars.

sizes, weights and speeds and must conform to innumerable other regulations both state and federal. It pays annually over $400,000,000 in special truck taxes over and above all regular levies on business, property and income. A 1940 report shows that it served 48,000 communities not reached by the railroads. (*See* also BUSINESS REVIEW: *Industrial Groups;* HORSES; MUNITIONS OF WAR.) (C. W. S.)

Other Countries.—No figures on the motor cars registered in most of the principal countries at the close of 1940 being available, the figures for the beginning of 1939 are given in Table II.

Table II.—Motor Vehicle Registrations, Exclusive of U.S., in Early 1939

Country	Private Cars Taxis '000's	Trucks Buses '000's	Total '000's
United Kingdom	1,916	626	2,542
France	1,750	500	2,250
Germany	1,306	402	1,708
Canada	1,161	220	1,381
Australia	552	252	804
U.S.S.R.	85	593	678
Italy	303	86	389
Union of South Africa	294	45	339

Even if figures were available, they would be misleading. The year 1941 opened with motor transportation reduced, except for military purposes, in all countries actively engaged in war. The spreading of the war and the effectiveness of the British blockade resulted in an extension in the reduction, until it can be said that no European country was unaffected. The extent of the reduction was variable in quantity, but the fall was rarely less than 50% and more often greater, since the vehicles still in operation were running a smaller mileage in a year. Many countries outside Europe were affected increasingly during 1941, so that not only in the old world but in Australia and Canada there were curtailments. Military traffic continued to increase, but not to the extent that civilian traffic declined.

In Great Britain the public services on the roads were further curtailed during the year. So great was the reduction that more overloading of vehicles was noticeable. Passengers often had to wait in long lines, and then travel in overcrowded vehicles. The movements in rates and fares differed. In some countries governmental control kept them stationary, while in others there were considerable increases. As in many countries all means of transport were overtaxed, the problem of division of function was in abeyance.

The problem of safety on the roads continued to be, if anything, of even more urgency than in 1940. With the decline in motor transport the casualties were fewer, but the accidents were more deadly. In Great Britain, for instance, while the persons injured fell by about 10%, the deaths nearly doubled as compared with prewar figures. Active steps were being taken aiming at a reduction, and the figures for August and September were the first to show any reduction from those of 1940. It remained to be seen whether the improvement would be continued. The chief causes, however, remained: restrictions on lighting and persons driving who had not been subjected to official tests and would not have passed them if they had been. A new cause was to be found in the condition of the vehicles. New vehicles were difficult to obtain, so vehicles were kept running to a greater age. New parts were obtainable only after long delays, so temporary repairs had to be resorted to. The vehicles were less reliable and failures leading to accidents more frequent. (*See* also RAILROADS.) (W. T. St.)

Motor Vehicles. During 1941 the automotive industry began to feel the full impact of the rearmament program. There was no formal announcement of the 1942 models. Design of 1941 models was not frozen because much retooling had been completed before the limitations of the defense program were evident and because re-design was required to replace critical defense materials such as nickel, aluminum and zinc.

The replacement of high nickel and chromium alloy steels with alloys containing manganese, molybdenum and silicon initiated refinements in heat treating technique and stimulated research on the problems arising from those substitutions. This research program should produce far-reaching results.

Early in 1941 it became evident that production curtailment of passenger cars would be necessary to save materials for defense purposes. The original production program for the 1942-model year called for a tentative curtailment of at least 50%. During the first seven months of the 1942-model year under this original program, allotments were reduced 39.7% with respect to the same period in 1941. With the United States' declarations of war with the axis powers in December, the original program was instantly discarded. The allotments for the last two weeks in December were reduced 25% and those for January were halved.

That an effort would be made to keep existing vehicles operating was indicated in 1941 when the Office of Production Management gave replacement parts priority status. The necessity for some such action was demonstrated by a comprehensive survey which showed that more than half the mileage and three-fourths of the automobile trips were for purposes connected with earning a livelihood or closely related economic pursuits.

National defense became the dominant factor in the automotive industry during 1941. Defense contracts totalling $4,272,676,000 had been received by motor vehicle manufacturers during the period from Sept. 1, 1939 to Oct. 31, 1941. Because most of the machine tools used in automobile production were not adaptable to defense production it was necessary to build many new plants and order new machine tools to fulfil these contracts.

Aircraft production became a major activity and there were few components of an aeroplane not being built by automotive producers. One company was building a 58-ac. factory for assembly line production of four-engine bombing planes; virtually all other manufacturers were building subassemblies of the various aeroplane components. Production of liquid-cooled aircraft engines was well established in two plants. Four automobile producers were in various stages of production of air-cooled radial engines and others were actively engaged in making engine parts.

The different defense items being manufactured were too numerous and diverse to be completely listed. Prominent among these were trucks, tanks, aircraft cases, gasoline and diesel marine engines, fire directors, heat exchangers, bulletproof gas tanks, tires, gas masks and machine tools.

Automotive methods applied to military and naval products in many cases resulted in improved design and ahead-of-schedule deliveries. Subcontracting was an important factor in expediting production.

The United States' entry into World War II gave the motor vehicle industry an even greater responsibility as a provider of munitions. As in the past, its most important contribution would be management-administrative and technical.

Motor vehicle production in 1941 showed an 8% increase over the previous year; United States factory sales were 4,820,000. Motor vehicle registration in the United States was 33,725,000 which was 74% of the total world registration. Exports showed a further decrease and amounted to 5.1% of production. Employment in auto, body and parts factories was 516,000 at be-

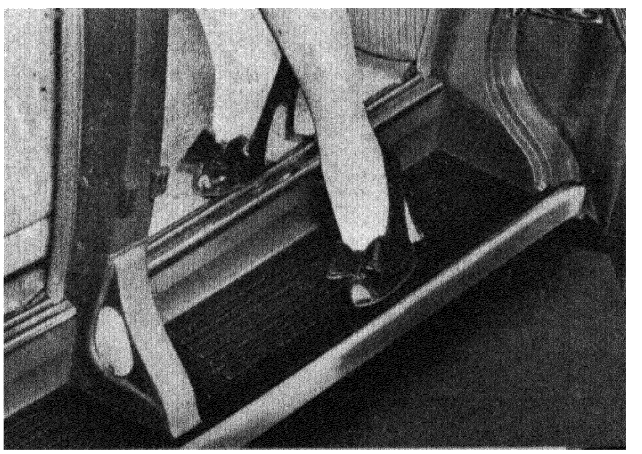
CONCEALED RUNNING BOARDS of full width and length were standard equipment on most 1942 cars



ginning of 1942. During the first nine months of 1941, motor vehicle deaths were 27,570, a 17% increase over 1940. Most of this increase was caused by increased travel; the mileage rate increased only 4%.

Transmissions.—Transmission improvements continued to be the foremost mechanical trend. Four additional makes of cars added such devices as optional equipment for 1942-models bringing the total to nine. Fluid couplings were in use on a majority of these because they smooth out the shift change. One model added a torsional vibration damper to the driving torus of the liquid coupling. One of the new transmissions eliminated the clutch pedal entirely while another was so arranged that it permitted either semi-automatic shifting, automatic clutch operation, or manual shifting with the latter always operative.

Conventional single disc dry clutches were used in all but one automatic transmission which used planetary gears and a combination of band clutches and multiple wet disc clutches. Automatic clutching mechanisms were actuated by hydraulic or vacuum devices.

Shift timing was controlled either by speed governors, throttle position or a combination of both.

All these devices permitted more effective use of a gear ratio with consequent increase in economy as well as acceleration and, at the same time, eliminated most of the manual gear shifting formerly required in normal driving.

Table I.—*Preliminary Statistics of the Automobile Industry, 1941 Calendar Year

Production and Value

Car and truck factory sales, from U.S. plants:†	
Total	4,820,000
Passenger cars	3,750,000
Trucks	1,070,000
Per cent increase over 1940, motor vehicles	8%
Wholesale value of cars	$2,610,000,000
Wholesale value of trucks	1,020,000,000
Wholesale value of cars and trucks combined	3,630,000,000

Military Assignments

Total defense orders cumulated from Sept. 1, 1939 to Oct. 31, 1941 (It should be noted that this total includes contracts already delivered.)	$4,272,676,000

Classified into broad groups, these orders were for the following equipment:

	Value	Per cent of total
Military motor vehicles and parts	$ 788,744,000	18.5
Aircraft, aircraft engines, subassemblies and parts	1,988,076,000	46.5
Tanks and parts	713,067,000	16.7
Marine equipment	234,505,000	5.5
Guns and ammunition	532,006,000	12.4
All other	16,188,000	.4
Total	$4,272,676,000	100.0

Registrations

Motor vehicles registered in U.S. (Dec. 31, 1941)	33,725,000
Motor cars	28,875,000
Motor trucks	4,850,000
Number of vehicles required to replace vehicles scrapped	2,600,000
World registrations of motor vehicles	45,500,000
Per cent of world's automobiles in U.S.	74%
Per cent of motor vehicles on farms and in villages under 2,500 population	40%
Passenger cars	30%
Trucks	46%

Taxes

Total motor vehicle user taxes	$2,100,000,000
Gasoline taxes, federal, state and municipal	1,325,000,000
Per cent motor user taxes to all taxes from all sources, federal, state and local	11%

Foreign Sales†

Number of motor vehicles exported from United States	245,000
Per cent of U.S. production exported	5.1%

Employment

Employment in auto, auto body and parts factories	516,000
Weekly payroll, wages	$20,600,000

Motor Trucks and Buses

Motor trucks in use	4,850,000
Total special motor truck taxes	$550,000,000
Number of bus and truck drivers	4,300,000
Motor buses in use	145,000
Number of communities served only by motor vehicles	48,000
Number of children carried to school daily by buses	3,075,000
Per cent of trucks privately owned and operated	86%
Per cent of livestock hauled to market by truck	57%
Number of trucks on farms	1,047,084

Motor Vehicle Retail Business

Total dealers handling passenger cars	38,836
Total repair shops	87,452
Total retail outlets, duplications eliminated	93,694
Wholesalers	6,585
Retail gasoline outlets	400,000

Passenger Car Use

Per cent of cars used partly or entirely for business purposes	95%
Per cent of passenger car *mileage* for business purposes	55%
Per cent of passenger car *trips* for business purposes	77%
Number of U.S. cities without local mass transportation, dependent on passenger cars	2,320
Number of passenger cars on U.S. farms	4,144,136

*Compiled by Oscar P. Pearson, Chief Statistician, Automobile Manufacturers Association.

†Including military vehicles delivered to U.S. armed forces and non-axis governments.

  Troop transport trucks
  Weapon carriers
  Wrecker trucks

Engines.—Owing to the shortage of many critical materials caused by the rearmament program there were many engine changes in the 1942 models. Aluminum for pistons was replaced by cast iron or steel in all but a few models; these latter were prepared to change when the necessity arrived. The use of an oil-absorbing coating of insoluble iron and manganese phosphates to replace tin plating on pistons increased. The increased weight of ferrous pistons resulted, in some cases, in heavier crankshafts and connecting rods as well as larger main and connecting rod bearings and the more general use of steel-backed thin babbitt bearings. One maker, following aircraft engine practice, was shot-blasting connecting rods to improve fatigue life. Rough surfacing of crankpins was introduced in one engine to increase bearing capacity. Some carburetter bodies were of cast iron rather than zinc alloy die castings. An oil cleaner of greater efficiency redesigned with a steel stamping to replace an aluminum casting was featured on one model. The trend of engine power and compression ratio was upward.

Passenger Car Bodies.—Continuing the trend set several years before, the 1942 models looked longer, lower and more massive. Wheelbases and overall lengths were slightly increased but the principal reason for this appearance change was improved design rather than an appreciable dimensional increase. Front fenders were longer and on six makes of cars long, sweeping lines were achieved by extending the front fender into the door. Radiator grilles were wider, bumpers were heavier and curved around the fenders for added protection. Hoods were broader and more rounded in front. Headlamps were farther apart and one model featured recessed lamps covered by sliding panels which were flush with the fender and operated by a knob beneath the instrument panel. With but few exceptions running boards were either absent or concealed by the door. Streamline bodies provided two to three inches more headroom in back. Heating and ventilating systems were the object of general improvement and nearly all provided fresh air intakes at the front. Decorative plating which appeared on the early 1942 models was discontinued to conserve chromium, nickel and copper for defense uses. Die-cast radiator grilles of zinc alloy were replaced by steel stampings.

Chassis.—Heavier and redesigned frames, changes in spring rates, and smaller wheels were among the changes made to accommodate the wider, longer bodies. Wider base rims providing increased lateral stability were introduced. A redistribution of braking effort was effected on some cars to increase the proportion of the total braking effort carried by the front wheels. A brake drum sealed from dirt and designed to nullify the effects of heat expansion was introduced. Interleaf spring lubrication by oil-filled wood liners and by wax-impregnated liners was featured. Mount Holyoke College. A pioneer American institution for the higher education of women founded in 1837 by Mary Lyon and situated at South Hadley, Mass. The campus covers 480 ac. with more than 70 buildings. Registration figures for the 1941–42 session included 1,014 undergraduates and 55 graduate students, a total of 1,069. The teaching faculty numbered 137; the endowment fund as of

June 1941 was $5,356,354; the total college income for 1940 was $1,375,260. Gifts received during the year 1940–41 amounted to $66,306. (R. G. HA.)

Mowat, Robert Balmain (1883–1941), British historian, was born Sept. 26 in Edinburgh. During World War I he served in the naval intelligence department and in the secretariat of the war cabinet. He was professor of history at the University of Wisconsin, 1925–26, and at the University of Bristol after 1928; in Nov. 1940 he began a lecture tour of U.S. universities as a visiting professor, under the auspices of the Carnegie Endowment for International Peace. He was also a member of the British Library of Information in New York city. Among Mowat's many books on American and European history are *Europe in Crisis* (1936), *The Fight for Peace* (1937), *The United States of America* (1938) and *The American Entente* (1939). He was killed in the crash of a transatlantic ferry plane in Scotland, Sept. 1.

Muir, John Ramsay Bryce (1872–1941), British historian and parliamentarian, was a graduate of University college, Liverpool, and Balliol college, Oxford, and taught history at Liverpool and Manchester universities. He was a prominent member of the Liberal party and was elected to the house of commons from Rochdale in 1923. From 1933 to 1936 he held several important executive posts in the National Liberal party. In early 1941 he warned against any postwar move to split Germany into small states, maintaining that these fractions would eventually reunite and seek revenge. Among his publications are *Atlas of Modern History* (1911), *Britain's Case Against Germany* (1915), *America the Golden* (1927), *Political Consequences of the Great War* (1931), *The Interdependent World and Its Problems* (1933), *A Brief History of Our Times* (1934), *The Record of the National Government* (1936) and *Civilization and Liberty* (1940). He died in Pinner, Middlesex, Eng., May 4.

Mules: *see* HORSES.

Municipal Government. The experience of British cities in wartime showed that municipalities and their occupants might at any time find themselves in the forefront of the battle. Defense, however, of necessity had to be designed on a national scale. Hence it was the tendency in wartime for the lines of local and national government to coalesce at certain points. The events of 1941 precipitated this condition in American cities. The emergence of the cities as agents of the federal government in the increasing development of the civilian defense program overshadowed every other aspect of local government in 1941.

Civilian Defense.—The number of local defense councils jumped from about 1,500 in May 1941 to about 6,000 at the close of the year. The New England area had the largest number, while Texas had by far the largest state total. Some states, however, had not more than six each. The number of volunteer enlistments in civilian defense jumped from less than 1,000,000 in November to an estimated 5,000,000 following the attack on Pearl Harbor.

While responsibility for the ordering of blackouts and air-raid alarms was placed in the military authorities, trial or test blackouts were had on the order of local authorities, provided adequate advance preparations were made and warnings given. The adoption of blackout ordinances by municipalities in all strategic areas was urged by the Office of Civilian Defense (*q.v.*) and the army. Seattle was the first city to enact a blackout ordinance preparatory to a practice air-raid drill. Months of planning were required to blackout the city for 15 minutes. Pittsburgh, Pa., and to a lesser extent Boston, Mass., Newark, N.J., and El Paso Tex., also had demonstration blackouts earlier in the year. A 15-minute test blackout was held in Washington, D.C., the night of Dec. 30.

The concentration of war industry and military activities in certain communities created problems in some instances of major proportions due to shortages of housing, health and sanitation, education, recreation and other community facilities. An appropriation of $150,000,000 was made available to cities by the federal government in June 1941 for the construction and equipment of municipal public works to meet this need. The funds were available in the form of loans, grants or leases. Schools and school additions constituted by far the largest number of projects under this program, with recreation next. The federal government bore the entire cost of recreational buildings and facilities for the welfare of service men; in other cases the grants varied on the basis of the permanency of the need and the ability of the community to finance it. The grants ranged from 100% in a few cases down to about 40%, with the average somewhat more than 50%. A second $150,000,000 was in the process of being made available at the close of the year.

The extent of the effect of the defense program on cities—the outstanding municipal problem of the year—could not be foreseen. But its nature could be indicated. There were difficulties in securing priorities on materials and supplies requisite for the maintenance of municipal services; in the loss of employees through the draft and to defense industries offering higher remuneration; in municipal salary and wage increases due to the rapidly rising cost of living; in the expansion of community facilities—school, garbage collection, traffic signals and policing—in "boom" cities; and in some instances in "defense depression" due to curtailment of private industry of a nondefense character. The available studies of defense communities indicated that the defense spending program on the whole had an enormously stimulating effect on the economic life of local communities and that the adverse effects were—with certain exceptions—more anticipatory than real, or over-balanced in specific communities by the favourable factors, with the government actively intervening to counter the adverse effects in serious cases.

An American civil defense mission, consisting of two police officers, two city engineers, a health commissioner and an expert on housing and building, was sent to England to study the effect of total war on the civilian population and reported its observations and recommendations. Three battalion chiefs of the New York city fire department also visited London in the fall of 1940 to observe the methods used in the handling of incendiary bombs, and the department trained its men on the basis of their experience. London fire fighters returned the visit, especially to study American equipment. A board of disaster control in New York city, consisting of representatives of various city agencies dealing with the protection of life, health and property, worked out comprehensive safety plans. Similar agencies were set up in a number of other communities. Mutual-aid plans for the extension of water, police, fire and other services between neighbouring municipalities were worked out in a number of states.

The direct relationship between the national government and the municipalities appeared at other points of the defense program outside the Office of Civilian Defense. Priorities for municipal supplies, for instance, were handled through the state

and local government requirement branch, division of civilian supply, Office of Production Management (*q.v.*). By mutual agreement, the handling of "fifth columnist" enemy alien activities was left primarily to the Federal Bureau of Investigation (*q.v.*), with state and local governments rendering such assistance and co-operation as may be required. Special instruction courses were planned by the Federal Bureau of Investigation for municipal, state and other police administrators in a large number of municipalities to cover special wartime and emergency duties. The tire rationing system, under the Office of Price Administration (*q.v.*), was operated locally by tire-rationing boards designated by local officials in co-operation with the local defense councils. War insurance against property loss resulting from enemy attacks in continental United States was provided in Dec. 1941 through a federal war insurance corporation set up by the Reconstruction Finance corporation.

Greatly increased financial aid to municipalities for civil airports was being provided through appropriations to the Civil Aeronautics administration.

Defense Housing.—An acute housing shortage in defense communities developed during 1941. The situation was complicated by friction between the various federal agencies engaged in defense housing activities, whose relations were still unclarified at the close of the year, and by conflict between federal and local housing authorities over the question of local regulation of federal defense housing construction. The volume of residential construction increased to the highest levels since the late '20s. (*See* HOUSING.)

Finances.—The aggregate local government debt, exclusive of local housing authorities and of New York city, which increased its debt for the improvement of water supply and subway acquisition, declined 1.6% during 1940–41, according to a study issued by the bureau of the census in Dec. 1941. Other studies of municipal debt confirm this downward trend, in contrast to the marked increase in federal debt.

The defense program put a stop to capital improvements except as required for military or industrial developments. Many cities thus reduced their indebtedness, while a few rearranged their debt structure by refunding callable bonds at lower interest rates (*e.g.*, Detroit and Pontiac, Mich.; Kansas City, Mo.; Philadelphia, Pa.). There was a striking falling off in municipal borrowing by the last quarter of the year. Municipal bond sales in Oct. 1941 and Oct. 1940 were $25,000,000 and $120,000,000, respectively. Only one or two major improvement issues were voted on in the fall elections. Municipal bond prices reached an all-time high in Nov. 1941, but showed a marked decline in December due to the general market disturbance caused by the war. November and December showed the highest price levels and lowest interest yields in history (1.90% and 1.93%, respectively, according to the *Bond Buyer's* monthly index based on bonds of 20 large cities).

Municipal revenue collections continued to improve. Tax rates and assessed valuations were relatively stationary, except in the largest cities where the rates increased slightly and assessed valuations continued their slow downward trend. New York city decreased its sales tax from two cents on the dollar to one cent.

Relief.—One of the immediate effects of the national defense program was the removal of thousands of people from the local relief rolls.

Personnel.—Three significant surveys of municipal salary and wage increases indicated the classes of employees affected and the methods of increase utilized. A study by the International City Managers' association covered 27 cities, each having a population less than 300,000; the Milwaukee Municipal Reference library examined 21 cities, each having a population over 300,000; while the Municipal Finance Officers' association covered 384 reporting cities in different population groups. The great majority of cities acted in favour of wage or salary increases, particularly to the lower wage earners.

Progress continued in the public-service training of state and local employees. About one-seventh of such employees were reached in 1940; the majority were police and fire officers. The New York state program for 1940–41 showed a total enrolment of 36,268, an increase of more than 7,000 over the preceding year. More than 10,000 city employees enrolled in courses operated by the bureau of training of the New York city civil service commission. The bureau offered courses to representative city employees from all parts of the U.S. in Dec. and Jan. (1942) on the protection of vital utilities and city services during wartime. The Institute of Public Service was opened at the University of Chicago to make special training in various aspects of government available to public officials and employees and others in the Chicago metropolitan area.

A threatened strike of subway workers in New York city was averted when the city extended existing contracts made with the Transport Workers' union when the subways were in private hands, pending a court determination of the city's powers to contract with labour organizations in view of civil service regulations. Meanwhile, wage increases in the transit system amounting to more than $5,000,000 were granted in September. The case against collective bargaining agreements in public employment is strongly stated in a report of the National Institute of Municipal Law Officers (Aug. 1941).

Health.—The effect of the defense program has been to shift the emphasis of city health programs. Thus, city health departments administered tests for tuberculosis and syphilis in connection with the Selective Service (*q.v.*) act in co-operation with the army and local draft boards. Large supplies of serums or vaccines were prepared in anticipation of the outbreak of communicable diseases. Control of venereal disease was expected to be the main health problem in defense communities. An intensive nutrition education campaign was launched in 1941, stressing the importance of a scientifically adequate diet for everyone. More than 300 new workers were given intensive courses on the special health problems of defense areas by the U.S. public health service to meet the increased need for personnel in state and local health departments.

Safety.—*See* ACCIDENTS.

Crime.—*See* CRIME.

Elections.—Interest centred chiefly on the proportional representation cities, seven of which held their regular biennial proportional representation elections in 1941. Cambridge, Mass. elected a proportional representation council for the first time; the remaining cities were: New York and Yonkers, N.Y.; Cincinnati, Toledo and Hamilton, O.; and Boulder, Colo. Legislation was adopted in Massachusetts enabling Boston to adopt proportional representation, and a campaign was being planned for 1942. The New York city vote gave representation to nearly 500,000 more voters than had ever elected aldermen under the old plan, and placed three women, one Negro and one communist on the council. Some very influential voices were raised against proportional representation during the year. Out of the 23 referenda on proportional representation held in cities of the U.S., however, 21 upheld it. (*See* also ELECTIONS; PROPORTIONAL REPRESENTATION.)

City Manager Plan.—Eighteen cities in the U.S. adopted the council-manager plan in 1941. The plan was in effect in a total of 513 cities and 6 counties of the country as of Dec. 31, 1941. A vote on its abandonment was held in five cities; it was retained in each case.

Postwar Planning.—The defense program had its counterpart in the plans under way for the resumption of peacetime activities when war ended. Cities were planning to make their contribution to maintaining full employment during the transition to a peacetime basis. One of the outstanding provisions for this purpose was the establishment of a public work reserve, announced June 23, 1941, sponsored by the Federal Works agency, cosponsored by the National Resources Planning board and operated by the Work Projects administration. Its purpose was the establishment of a national shelf of work projects to be undertaken by local, state and federal agencies when needed in the postwar period. Headquarters were in Washington, D.C.; there were four regional field representatives: an eastern, southern, central and western; and 43 state (or combination of state) administrations, each under a state director and each divided into two sections: a construction or capital improvements section and a nonconstruction or public services section. Assistance was given to state and local governmental units in preparing long-range public improvement programs on a priority basis of actual need or expediency and in making the requisite preliminary studies. Programs were on a six-year basis for each community, with one year of actual budgeted improvements and five years of planned work beyond, subject to continuing review and revision of the inventory and program. An incentive was thus furnished to local governments to plan, so as to be ready to meet the exigencies of the postwar future.

One area of postwar activity in metropolitan centres was the rehabilitation of blighted areas, estimated to have spread to one-fourth of urban U.S., including property assessed at approximately $20,000,000,000 and involving the welfare of about 50% of the urban population. In New York city alone 7,671 acres were designated by the planning commission as sub-standard. Large-scale replanning and rebuilding, including adequate housing, were called for through a combination of private enterprise and public authorities, possibly with federal financial assistance. The New York state urban redevelopment corporations law, enacted in 1941, permitted municipalities to offer special inducements to private corporations to undertake large-scale development of such areas, subject to suitable local controls; similar legislation was adopted in Michigan and Illinois.

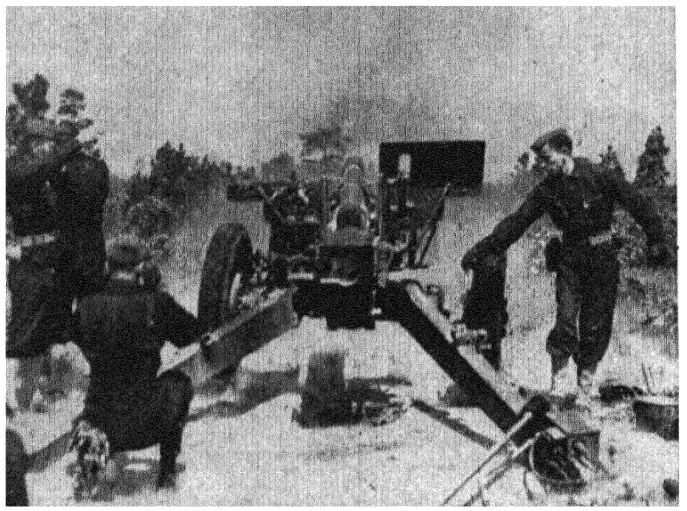
Miscellaneous.—The year 1941 marked the publication by the National Municipal league of its 5th revision of the *Model City Charter*, first issued in 1900; the holding of the second Inter- (formerly Pan) American Congress of Municipalities at Santiago and Valparaiso, Chile, which adopted a program for municipal co-operation in promoting inter-American friendship; the creation of a bureau of urban research at Princeton university to serve as a clearing house of information and research to those concerned with urban problems; a notable survey of local government in Chicago by civic organizations, which resulted in measurably reducing the city's operating budget for 1941; and the inauguration of a study by leading tax experts, under the auspices of Secretary of the Treasury Morgenthau, to examine the whole field of federal-state-local fiscal relations.

(L. GU.)

Munitions of War.

In 1941, the business of munitions making became, for the first time in history, the primary occupation of civilized man. For although in the course of that year but 15–25% of all production had gone, in the United States at least, into war goods (in 1940, only 7%), a program was already in effect which, in 1942, would see this figure increase to 49%—in 1943 to 54%. And so the American citizen who, on Jan. 1, 1942, was feeling the first impact of the new order in the form of a strict rationing of rubber (automobile tires), perhaps gained therefrom a faint glimmering of more and sharper curtailments yet in store.

Nevertheless, the United States, self-constituted "Arsenal of Democracy," faced the year without trepidation, confident that means would be found to produce in sufficient quantity, and



NEW 105-MM. HOWITZER of the U.S. army which began to replace the older 75's in 1941

within the time limits imposed by the exigencies of a world war in which she was now a participant, the munitions requisite to the overthrow of the axis powers. For most production schedules had been met—many surpassed. Considering the several categories involved, we find:

Aircraft (Army).—About 2,320 military planes by 1941 had been America's "huge" program of 1938. But as 1941 ended, her quota of 18,000 ships for the year was practically assured. This was to be increased in 1942 to 30,000, while by the end of 1943, a monthly output of 3,600 planes of all varieties was counted upon.

As in the past, engine horsepower ratings, armament, speed and ultimate ceilings continued to expand. Single motors of as many as 18 cylinders and developing well over 2,000 h.p. were relatively numerous, and though official figures indicated few maximum speeds of over 400 m.p.h., aero engineers quietly estimated that at least one newcomer averaged between 540 and 580 m.p.h. The typical fighter (in the U.S. army air corps uniquely designated "pursuit") was a single-seat monoplane of all-metal construction with a speed in the vicinity of 400 m.p.h., ceiling of 30,000-35,000 ft., weight loaded of 5,000-7,500 lb., range of 600-1,000 mi. and a motor of around 1,000 h.p. Its .30 calibre machine guns were generally augmented by others of .50 calibre, plus frequently one or several small cannon of 20- to 37-mm. bore. Fire power was truly enormous, some (British) planes mounting as many as twelve .30-calibre pieces. Wing cannon too were coming to the fore, and of this type, the United States had adopted the 20-mm. Hispano-Suiza (with a cyclic rate of 575 rounds per minute). Of especial significance was the fact that its planes were now credited with possessing a secret fire control device of great exactness. For high-altitude operations, her "turbo-supercharger" embodied a turbine driven by engine exhaust gases, which compressed the rarefied air of the substratosphere, permitting motors to "breathe" without loss of power. To combat the physiological "blackout" experienced by pilots in power dives at tremendous speeds, tests were being conducted with ships controlled by pilots flying in a prone, rather than a sitting, position. The U.S. army had officially adopted a dive bomber (a modified navy product), and its air corps, now granted a considerable measure of autonomy, was devoting no little attention to ships of that type. In the field of high-altitude bombers it launched the Douglas B-19, world's largest, with a wingspan of 212 ft., weight, loaded, of 164,000 lb., four motors totalling 8,000 h.p., and capable of carrying 18 tons of bombs. The army was also pushing the production of transport planes, whereas Germany was credited with 1,000-1,200, each capable of carrying 25 men with full equipment. The parachute soldier had become a fixture in all first-rank military establishments. Glider transport also was everywhere receiving serious study. On Aug. 2, the first American organization of a new type, the 550th air-borne battalion, had been activated. Later (October) the 80th U.S. infantry-air-borne took shape. Meanwhile the marine corps commenced to train its own parachutists at points on east and west coasts.

Where no prepared fields were available, U.S. army planes were finding an efficient substitute in "Marston landing strips"—perforated sections of thin steel sheeting which could readily be hooked together to form a flat surface capable of receiving, for landing or take-off, ships of every type from smallest to largest. Safety of the individual aviator was promoted through the development of a new fire extinguisher whereby the pilot, pulling a lever, could blanket the entire engine compartment with flame-choking carbon dioxide.

Crystal clear, as the year 1941 ended, was proof of the fact that the aeroplane was more than an unfulfilled threat to the backbone of a nation's naval power—the capital ship. This was brought home with frightful force as the year drew to a close by the sinking or capsizing through enemy air action of a number of the mightiest ships of the world's great navies. (*See* WORLD WAR II.) In these engagements the torpedoplane played a significant, sometimes a predominant part, though high-altitude and dive bombers were by no means unrepresented. Proved too, were any proof needed, was the importance of the aircraft carrier, lacking which Japan could not have placed within striking distance of their objective the 150 to 300 planes which executed the attack of Dec. 7 on the United States forces at Oahu, an event which destroyed for all time that complacency with which the average American had previously viewed the possibility of air invasion from overseas. Even New York city awoke to the practicability of an assault by Germany's "Heinkel 177" bombers, of which it was known to possess 150 not theretofore employed. These, with a range of 7,040 mi., could readily make the round trip from certain points in occupied France but 3,320 mi. distant from the Atlantic coast metropolis, as might, from a sea-borne carrier, Dornier flying boats (5,040 mi. range) or Italy's 100 or more Savoia Marchettis. For despite its increasing production rate monthly as 1941 ended, the United States was as yet in no position to defend itself at all points.

Aircraft (Naval).—A naval torpedoplane was responsible for the sinking (May 27) of Germany's 35,000-ton "Bismarck," pride of its postwar navy. Its location betrayed by a patrol bomber and its steering gear disabled by an air-borne torpedo, it became easy prey to the swarm of surface vessels which quickly assembled for the kill.

The U.S. navy, which in mid-1940 had set itself a goal of 15,000 planes for its air service, acquired during the fiscal year 1941, some 2,059 aircraft of all types as against 306 in the year preceding. Launched on Nov. 8, the "Mars," navy's counterpart to army's B-19, carried four 2,000-h.p. motors, weighed with full load 135,000 lb., and was capable of round-trip, nonstop cross-Atlantic flight. Its wingspan was 200 ft. A glider program was under development with two-place trainers and 12- and 24-place carriers on order. (*See* AIR FORCES OF THE WORLD.)

Anti-Aircraft.—To its already formidable array of anti-aircraft weapons the army added two new types—the 40-mm. Bofors piece, of Swedish ancestry, and the 4.7-in. gun. Characteristics of the former included a rate of fire of 120-140 shots per minute with a 4¾-lb. cartridge, the explosive projectile of which ranged to 11,000 yd. horizontally or 5,400 vertically. Of the 4.7-in. gun, "super-super" among existing anti-aircraft weapons, little information was available, though unofficial accounts credited it with a vertical range of well over 40,000 ft. And since aircraft were not yet prepared to operate at such an altitude, this development served once again to bring the highest-flying ships within reach of defensive artillery. And a partial answer to the threat of the dive bomber and other low-flying attack planes, the speed of which rendered them at close range almost immune to the fire of guns lacking instant manoeuvrability (a characteristic not possessed by the heavier types of anti-aircraft weapons), was found in mounting MG's of .50 calibre and machine cannon of 20-mm. bore in multiples of four "pom-poms." In another field of anti-aircraft activity the United States launched its first barrage balloons at Camp Davis, N.C., in September. Meantime, the marine corps, not to be outdone, had organized and put in operation its own balloon barrage school at Parris Island.

Air Bombing.—High-explosive ("HE") air bombs in general use varied from 100 to 2,000 lb. in weight. Striking in sandy loam, the former produced craters 6 ft. deep and 20 ft. in diameter, while the latter excavated areas 36 ft. in depth and 50 ft. across, their splinters being dangerous over distances of 200 to 1,200 ft. respectively. These figures referred to bombs with delayed-action fuses which permitted them to burrow deeply before exploding. (With an instantaneous fuse the penetration figures were but 2 and 7 ft.; crater diameters 9 and 22 ft.) For protection against direct hits by these missiles, 2.4 in. of concrete or 5 in. of steel were required in the case of the 100-pounder; 11.6 in. of concrete, or 15 in. of steel for the larger. In the remote instance of a direct hit by the fortunately very rare 4,000-lb. bomb, no less than 100 ft. of normal earth or 50 ft. of solid rock were necessary to assure safety. Hits were of course easier to accomplish with projectiles dropped from low altitudes, but under such conditions the penetration was materially reduced, since the terminal velocity of a bomb dropped from 20,000 ft. was exactly double that of one released at 2,000 ft. And since bombs of all types acquired the forward velocity of the planes discharging them, they ranged onward for great distances from their points of release, making it possible for aircraft to "shoot and run" without the necessity of flying directly over chosen objectives. Thence arose the necessity for rings of barrage balloons and A.A. guns at considerable distances from the objects of air attack if these were adequately to be safeguarded. Reliable estimates indicated that a missile of 600-660 lb. (perhaps the most commonly employed heavy type) would destroy the top four or five floors of a modern steel skyscraper, persons sheltered on the lowermost four or five being likewise subject to injury by splinters from missiles landing in the streets. Intermediate floors were considered, however, practically danger-proof.

	ARMOUR PIERCING	DEMOLITION	FRAGMENTATION	AERIAL MINE	INCENDIARY LIGHT	INCENDIARY SCATTER	GAS
Usual weight	1100 lbs	550 lbs	30 lbs	2000 lbs	2 lbs	30 lbs	30 lbs
Range of weight	200-4000	100-4000	17-2000	1000-5000	2-60	17-500	30-600
Sectional pressure	9.7	3.1	2.0	-	0.3	1.5	1.5
Percent of explosive	10-15	40-60	15	90	-	-	-
Terminal velocity	1400 ft/sec	1100 ft/sec	725 ft/sec	-	350 ft/sec	-	-
Penetration	Excellent	Good	Poor	Poor	Poor	Fair	Poor
Blast	Reduced	Heavy	Light	Extr heavy	None	None	None
Used against	Warships and special targets	Buildings bridges and military concentrations	Personnel and transport	Wholesale demolition of weak structures over wide area	To cause fires for direct damage and to illuminate the target		Personnel contamination

VARIOUS TYPES OF BOMBS and their properties (from *Bulletins of the National Archives*)

Security against splinters from fragmentation bombs was offered by shelters with walls of 1½ in. steel and covers of ½ in. of that material, but these were obviously overheavy as well as quite expensive, and equal protection was to be had from a light framework covered with a 2-ft. thickness of sandbags. The employment of gas bombs, not thus far indulged in during World War II, remained an obvious possibility, but still rather improbable, since high-explosive missiles of equal weight had been found far more effective. If used, they probably would contain mustard gas—the more fatal phosgene type releasing fumes of very short persistence. Incendiary bombs, thousands of which had rained on London in Sept. 1940, causing some 20,000 fires in that city, commonly weighed 1 kg. (2.2 lb.) and embodied a thermite mixture in an "Elektron" case, the latter alloy consisting of 86% magnesium, 1% copper and [illegible]% aluminum. The charge of thermite (76% powdered iron mixed with 24% powdered aluminum) burned for about a minute, developing the terrific temperature of 3,000° C., and meantime igniting its Elektron container. This in turn blazed for an additional 12–15 min. Before the thermite was fully consumed, the bomb proved difficult to quench, since that compound carried within itself the oxygen necessary for combustion and was not compelled to borrow this from the surrounding air. Once it was exhausted, however, the flaming Elektron jacket could be extinguished with an asbestos snuffer or by the simple expedient of covering it with sand, since that alloy did rely on air oxygen for its continued combustion. Dousing the white-hot missile with water during the first minute proved risky business, for this promptly caused it to burst into many fragments, each in turn starting its own small conflagration. Later, however, water could be applied to advantage since it fed so much oxygen to the flame (on contact with which it broke down into its chemical constituents), that the whole was consumed in 4–5 min. instead of thrice that period. For the release of a number of fire bombs from a single container, the Russian "Molotov breadbasket" proved a fairly satisfactory medium. Once dropped from aloft, retarding vanes caused it to descend relatively slowly, centrifugal force throwing out its load of 10–12 dozen bombs a few at a time as it spun upon its axis, these to scatter and land over a wide area.

The Tank.—Experience showed that the light tank did not stand up in warfare as would a medium heavy model and that air-cooled types were highly desirable in desert operations where water was worth its weight in precious stones. It showed additionally that hits from moving tanks were extremely difficult to achieve (the Germans recognized this by halting their vehicles when ready to fire); and that the steel treads of the best European types would endure only about 800 mi. of African campaigning. Further, it had long demonstrated the fact that tanks with riveted hulls might become death traps, the rivets shearing loose when the body received a direct hit, and flying about as secondary missiles to wound or kill members of the crew. Profiting by these observations, the United States supplied its tanks with a secret fire-control device said to increase by 500% the number of hits made from a machine in motion, powered them with air-cooled gasoline motors, fitted them with moulded rubber caterpillar treads good for 2,000–2,500 mi. of hard wear, and replaced rivets with welds (70%) and castings (30%), the last-named method representing tremendous saving in time and effort. Contours were rounded to reduce the chances of direct hits and armament was made more powerful. The three types upon which it had standardized included light, medium and heavy classifications, with the following characteristics:

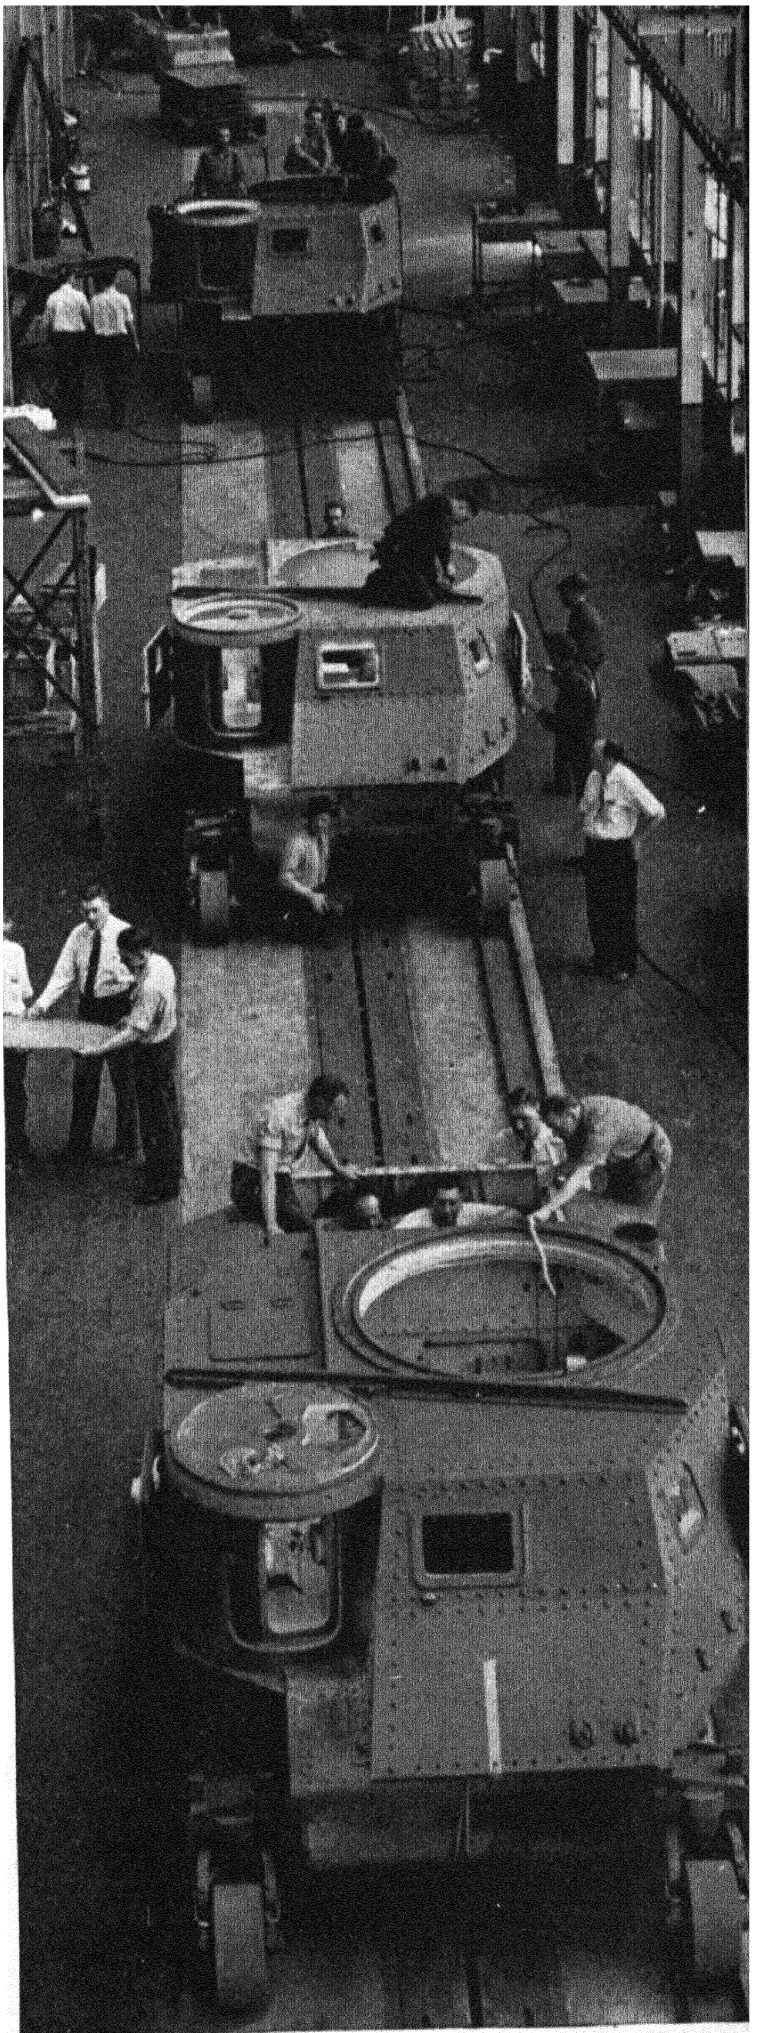
	Light	Medium	Heavy
Designation	M3	M3	M1
Weight	13.5 tons	25–30 tons	57–60 tons
Horsepower	200	400	2,000
Speed	45 m.p.h.	30 m.p.h.	25 m.p.h.
Crew	3 (?)	6	7
Armament	37-mm. gun & MG's	75-mm. gun; 37-mm. gun; MG's	75-mm. gun; 37 mm. gun; several MG's

Anti-Tank.—Observations made in Europe and Africa indicated that, when meeting on equal terms, the anti-tank gun had been superior to the tank. Determined to profit by that fact, the U.S. army announced, late in 1941, the formation of 52 "tank destroyer" battalions, using personnel and matériel from existing anti-tank units to build upon. Three types of such battalions were to be formed; viz.:

Light, with towed weapons, assigned to foot divisions.
Light, with self-propelled weapons, assigned to cavalry and motorized divisions.
Heavy, for armoured divisions, army corps and armies.

The equipment of one typical battalion included 36 armoured half-track cars mounting 75-mm. guns, 18 "jeeps" and "swamp buggies" (*see* section *Motor Transport*) carrying 37-mm. guns and 10 light tanks. Crews of four handled the half-tracks, which weighed 7,500 lb., possessed two-way radios, and were capable of 50 m.p.h. on good roads, not to speak of considerable cross-country manoeuvrability. The .50-calibre machine gun, no longer able to penetrate modern tank hulls, was being replaced by 37-mm. guns among cavalry special troops, and the general trend in anti-tank weapons the world over was toward heavier calibres and speedier movement. Against these marks of progress could, however, be recorded the fact that in August of 1941 the U.S.A. had a much smaller total of tanks on order than Germany and Russia, who were then credited with 30,000 each.

Army Organization.—The United States enlarged the number of its armoured divisions to five, each of 12,697 officers and men, and equipped with 158 light and 232 medium tanks. Motorized divisions were increased from one to two, with more proposed. These differed chiefly from the "triangular" (foot) divisions in that they possessed for each regiment, 201 half-track personnel carriers. To strengthen the motorized type a number of self-propelled howitzers were supplied to its infantry units, and



THE FIRST 28-TON M3 MEDIUM TANKS rolled off Chrysler's assembly line in Detroit two months ahead of schedule in 1941

its reconnaissance strength expanded by some 106 light and medium tanks and 452 bantam cars, while the addition to each support battalion of a mine company (to lay and recover mines and remove hostile types) was also under consideration.

In November the beginnings of a force of United States mountain troops were constituted. Originally scheduled to total 35,000, the figure was later amended to cover but a single reinforced regiment of 5,000—the 87th infantry, with an initial strength of some 800 officers and men.

As the year 1941 ended, the United States could point to an army of almost 1,750,000, with 34 divisions activated (including an armoured force of 5 divisions, 2 motorized divisions and 15 independent tank battalions) as against Germany's estimated forces of 4,500,000 distributed among some 260 divisions, 20 of these armoured. (*See* ARMIES OF THE WORLD.)

Navy.—By Dec. 1, 1941, the United States had committed itself to the construction of a two-ocean navy of some 687 fighting vessels which included:

32 battleships	
18 aircraft carriers	362 destroyers
91 cruisers	184 submarines

Three hundred and forty-three of these were already in commission; 341 more were being built or on the drawing board. The program thus far developed called for an expenditure of $7,500,000,000 in ships, plus another $1,000,000,000 for enlarged shore facilities. Inclusive of the major fighting units listed above, the fleet as then planned was to total 5,334 vessels, for the combatant elements, among which some 1,333,000 tons were already built, with more than 2,000,000 more authorized. The maritime commission, too, was doing its share and as the year ended, the total of merchant ships being built reached well over 700. As in the case of the tank, the rivet, so far as the shipbuilding industry was concerned, was fast giving place to the weld, with an average reduction of 13% in deadweight, not to mention the saving in time and effort.

The threat of the "magnetic" mine, one of Germany's secret weapons launched early in the war, was now dissipated through the general installation on naval vessels of "DeGausse" girdles—systems of electric cables which neutralized the ship's magnetic field. Alive to the danger of underwater attack, naval constructors were producing capital ships capable of withstanding four or five torpedo hits and remaining afloat. Of this type was the "Bismarck," which did not succumb until after receiving seven such blows, not to mention 20 others by 15-in. shell and more than 300 additional from missiles of 8-in. calibre.

The Submarine.—The United States, in order to take advantage of shipbuilding facilities wherever they existed, undertook to construct submarines on Lake Michigan, floating the finished vessels down the Illinois and Mississippi rivers to the sea. But the submarine sensation of the year was the "2-man" type, employed by Japan in her combined naval and air attack on Oahu on the morning of Dec. 7, in the course of which three of these small vessels were destroyed. Whether these tiny contrivances had inflicted serious damage on any American vessel or vessels was not revealed, but the fact that Japan had been able to keep their existence a close military secret constituted, in itself, a minor victory. (*See* BLOCKADE; SUBMARINE WARFARE.)

Arms and Explosives.—For the erection of new plants and the enlargement of existing installations devoted to the production of smokeless powder, T.N.T. (a shortage of which existed) tetryl, picric acid, ammonium nitrate, small arms ammunition fuses, armour plate, machine guns and aeroplane cannon, and for the loading of shells, bombs and powder bags, the U.S. ordnance department had expended by Dec. 1941 some $2,000,000,000. Developmental work was being carried on at six permanent arsenals, at the Aberdeen proving ground and by 450 private concerns producing ordnance matériel. Procurement plans for ordnance items were being prepared from studies made by the office of the chief of ordnance, the Army Industrial college, the army-navy munitions board and the planning branch of the undersecretary of war. U.S. production of smokeless powder had risen 1,000% during 12 months, of small arms ammunition, 1,200%. The awarding to various manufacturers of "Educational Orders" as authorized by congress in 1939 had developed sources of materials and components and familiarized many manufacturers with governmental inspection methods, and the "production studies" elaborated to supplement these, while providing for no actual manufacture, did serve to instruct various industrial concerns in the technique of fabricating certain important items. Ten new ordnance storage depots, in addition to 11 already in operation, were under construction. The money value of ordnance matériel delivered to the army in Oct. 1941 was eighty-fold that of May 1940, and was to be increased to 360 times the 1940 figure by June 1942. Sixty-seven government-owned ordnance plants were either in operation or on the way. In addition to new types under construction, quantities of World War I artillery of calibres from 75 to 250 mm. were being restored for service. Third in priorities (following the navy and air corps) the ordnance department had a "shopping list" of 1,200 major items—involving some 200,000 components. Plastics were replacing wood in pistol and bayonet grips and on slide handles of machine guns. The Garand semi-automatic rifle was coming from production lines in gratifyingly increased quantities. The army, observing that a goodly percentage of the world's nonrifle-carrying fighting men were being supplied with machine pistols or submachine guns in place of the revolver and automatic pistol, went a step further and announced that the Colt .45 automatic pistol, its official side arm since 1911, was on the way out as a weapon for enlisted men, and for officers below the grade of major—to be replaced by a new semi-automatic carbine of Winchester make, selected after exhaustive tests participated in by a number of competing models. (It had already purchased and issued in great numbers, submachine guns to selected units.) Characteristics of the newcomer included a weight of 4.6 lb., barrel length of 18 in., and over-all length of 35 in. (Other military submachine guns to which this was comparable weighed 9 to 10 lb., and the light weight of the new piece was hailed as an engineering achievement.) Loading was from a conventional box-type magazine holding 15 cartridges of .30 calibre, with 110 grain bullets. Muzzle velocity was 1,900 f.s., and the accuracy range 300 yards and better, as against 50 yards for the pistol. Eighty per cent of the soldiers then carrying the latter arm were to be issued the carbine in its stead, the estimated increase in fire power of an infantry regiment so equipped being around 33%. The first complete battery of 90-mm. A.A. gun carriages to be produced commercially was delivered in October. Provisions for storage of explosives were keeping up with the manufacture of these, and during one 24-hour period in September, "igloos" (special concrete storage buildings with floor dimensions of about 26x60 ft.) were being poured at the rate of one per hour at a certain ordnance depot. Cotton had largely replaced the now practically unobtainable silk as cartridge bag cloth, though tie straps were still of the latter material, which remained also in use for bagging charges for guns of super-heavy calibres. Yet, notwithstanding all the progress recorded, "Quaker" guns were still badly needed for training purposes while the real articles were being produced, and one Ordnance Maintenance shop (July 1941) was running three 8-hour shifts to turn out dummy 37-mm. guns and 81-mm. mortars for the use of the division to which it was attached.

Artillery (Coast, Railway, Field).—A newly developed United States 6-in. coast defense gun had all-around traverse and was covered by a streamlined steel "hood" affording a high degree of protection to its crew. The first 8-in. railway artillery gun mount to be made since 1918 was accepted in Feb. 1941. More were coming. Five new diesel-driven locomotives were purchased by the engineers and turned over to the coast artillery corps for the use of railway artillery organizations. Self-propelled artillery in calibres of from 37 mm. to 155 mm. was being developed by the ordnance department for use in the field, where divisional artillery embraced guns and howitzers of 75 mm. and howitzers of 105 mm., corps artillery comprising the heavier 155-mm. gun and howitzer (a revised, long-range model of the latter was standardized during the year); supplemented by a new piece of 4.5 in., relatively light for its calibre and capable of many missions including anti-tank work. The famous "75" field gun of World War I was fast being supplanted for most purposes by the 105-mm. howitzer. The latter weighed but 1,200 lb., had a barrel 8 ft. in length, and was usually truck-drawn. It could go into firing position in a space of 3 minutes and throw a 33-lb. shell (over twice the weight of that of the "75") to a range of 13,600 yd. (almost equal to that of the "75"). The first such weapon to be produced from commercially made parts was delivered in October. Manufacturing technique as applied to the 37-mm. gun carriage had been greatly improved by the adoption of welding to replace older and less satisfactory methods. The first 155-mm. gun to be made outside of a government arsenal was delivered in October. It possessed a range of about 15 mi., almost 50% more than that of World War I vintage. A gun of this type, towed by a 7½-ton prime mover, covered a distance of 951 mi. at an average speed of 33.2 m.p.h.—hitting 75 m.p.h. at one point.

Engineers.—British engineers devised reinforced concrete covers to be placed over generators in power houses, which proved able to stand up under two direct hits. United States engineers produced a new demolition kit for the use of parachute troops. Extremely light, it contained a score of T.N.T. blocks, together with the necessary accessories—safety fuses, cap crimpers and blasting caps, the last isolated from each other and from the remainder of the contents by pads of sponge rubber. For bridging rivers U.S. engineers employed aluminum pontons of 1,400 and 2,800 lb. weight, the former sustaining a 10-ton load, the latter, one of 25 tons. This heavier type was carried on a newly designed semitrailer, as issued to the 87th engineer battalion, the first heavy ponton unit to be organized in the U.S. army. For highway bridging, it employed portable steel units of 10- and 20-ton capacity. River crossings were undertaken in plywood assault boats of 11-man capacity, to be paddled across small bodies of water by their occupants. Ten of these small vessels could be nested and transported on a 1½-ton truck. Motor-driven assault boats were under development by the engineer board. The first water-supply unit to take shape since World War I, the "80th engineer battalion—water supply," was organized in July. Personnel included 19 officers and 407 men—matériel, 9 water purification tank trucks and other vehicles. To develop its railway engineer troops, the United States government purchased a 60-mi. railroad in Louisiana and undertook to extend this by a 17-mi. addition, the whole to be operated by the "711th engineer battalion—railway operating."

Communications.—In July, United States authorities announced that "electric sentries" operating on radio beams were shortly to be installed along its coasts. Capable of spotting invading planes at ranges of many miles and of recording their altitudes, heights and distances from points of observation, they were patterned on a principle already used with success by the British. The U.S. army signal corps achieved an object long sought but never previously attained—two-way communication by carrier pigeon, the birds delivering messages and then returning to their starting points (with replies when required), over distances as great as 12 mi. A new radio truck with an operating radius extending (even when it was in motion) to 250 mi. was being developed. (Ranges of previously existing field radios were generally circumscribed so that those functioning on the same frequency might not interfere with one another, and frequency bands were, of necessity, limited.) New radio equipment was largely pushbutton operated. European armies had developed for their mountain troops, which possessed little telephone equipment (but many radios), a "visible telephone" over which conversations travelling on ultraviolet rays could be held at distances up to two or three miles, though the apparatus involved was cumbersome, and stations had to be sighted carefully upon one another.

Body Armour.—The U.S. army had developed a new helmet which weighed 2½ lb. (3 oz. more than the World War I type). Delivery of enough of these to supply several divisions commenced in December. It embodied a fibre lining which could be worn separately; was much cooler in use, and easier to keep in place than its predecessor. Further, it covered 80% more of the head surface than did the latter. Meantime, the navy was elaborating on a somewhat heavier model (4 lb.) lined with sponge rubber, which gave a high degree of protection and permitted the wearing of a set of headphones at the same time. Special anti-barbed wire gloves were being perfected by the engineers, their palms lined with two layers of horsehide.

Reports from England stated that a complete set of body armour (chest, abdomen and leg plates), weighing but 3 lb. and capable of stopping "tommy gun" and pistol bullets, had been produced and distributed to several divisions of its troops. American authorities were very doubtful—thought that such an outfit must weigh more than 10 lb. at the very least.

Medical Services.—The U. S. war department was seeking donors of 200,000 half-pints of dried blood plasma for emergency use in cases requiring transfusions. The employment of this substance in place of whole blood represented a great advance, as it could be administered without prior matching of blood specimens from donor and recipient. New first-aid devices included, for the German soldier, a sterile bandage located in a handy inside pocket at the bottom of his blouse; for the U.S. soldier, a small metal box which could be opened with either hand to release, one at a time, germicidal tablets containing one of the new "sulphur" drugs, for direct application to injured tissues. Fully equipped mobile surgical field hospital units, transported in 14 motor vehicles and capable of handling 80 operations in 24 hours, stood up under field tests. "Hospital ward" and "hospital unit" cars, the former with capacities for handling 32 patients, the latter fitted with complete examining and operating, administrative and kitchen facilities, plus quarters for the staff, were to be added to trains of standard Pullmans for the transport of sick and wounded. And based on an army of 1,400,000 within its continental limits, the United States was providing 70,000 beds in some 200 station hospitals scattered from the Atlantic coast to the Pacific coast.

Motor Transport.—The first crossing of the Sahara by motor vehicles producing their own gas from charcoal in special generators was accomplished by a French truck convoy which covered altogether 4,000 km.—1,800 of these across desert wastes. Japan was installing diesel motors in trucks and buses. The United States, planning for an army of more than 2,000,000 men, was buying multiwheel-drive vehicles by the scores of thousands. These included the "jeep," a small multipurpose combat vehicle of which several thousand had been issued by November and many thousands more ordered. With a length of 11 ft., width of 56 in. and height of 40 in., it weighed 2,200 lb. and cost but $900. Doors were replaced by "safety straps." While the crew regularly numbered three, six could be carried in an emergency. With six speeds forward and two in reverse, its 4-cylinder, 60-h.p. motor drove it at 60 m.p.h. and better on roads, 50 m.p.h. "cross country." Armament consisted of MG's of .30 or .50 calibre, or one 37-mm. gun, which was mounted sometimes facing forward, sometimes to the rear. An improved type, with 4-wheel steering as well as 4-wheel drive, capable of turning in an 11-ft. radius, was adopted during the year. The so-called "swamp buggy" was in effect a "super-jeep," with a similar low silhouette. Its chassis underslung, it carried a 37-mm. gun and was powered by an engine mounted in the rear of the body. Larger and heavier was the new ½-track scout car which boasted three .30-calibre MG's and was capable of a cross-country speed of 45 m.p.h.

Basic Materials.—Apart from facing the necessity of increasing, with lightning rapidity, its output of synthetic rubber if its citizens were to continue to enjoy, even in reduced measure, the advantages of motor transport, the United States was confronted by shortages in many types of essential materials—some serious, some merely irritating. These embraced various of the basic metals and extended also to certain iron alloys and machine tools. Substitutes for practically all these were hurriedly being developed. Thus the Radio Corporation of America had evolved over 40 replacement items for strategic materials in radio sets, one of which alone had saved 148,000 lb. of aluminum, and more than 20 of which were in actual use. Even "substitutes for substitutes" were appearing—as evidenced by successful efforts to devise new compounds to replace certain plastics.

GD.)

Murphy, J. Harvey (1882–1941), U.S. clergyman, was born April 28 in Paterson, N.J. He took his M.A. degree from the New Brunswick Theological seminary in 1909 and received a D.D. degree from Central College, Pella, Ia., in 1924. He was ordained to the ministry of the Reformed Church in America in 1909, served as pastor in Philadelphia, Pa., Amsterdam, N.Y., and Jersey City, N.J., and in Hudson, N.Y., 1921–41. He was president of the General Synod, Reformed Church in America, 1938–39. He died in Hudson, N.Y., Sept. 19.

Murray, Charlie (1872–1941), U.S. stage and screen comedian, was born July 22 in Laurel, Ind. After 20 years on the stage, he joined the Biograph company in 1912 and was one of the "Keystone Kops" of early silent-screen fame. Murray emerged from his minor roles to co-star with George Sidney in a series of talking picture comedies, *The Cohens and the Kellys*. After the popularity of this series waned, Murray was seen in a number of short comedies. He died in Hollywood, July 29.

Murray, Philip (1886–), U.S. labour leader. A native of Scotland, he was born in Blantyre May 25 and emigrated to the United States in 1902. Naturalized in 1911, he became a member of the international board of the United Mine Workers of America the next year, president of the union's fifth district in 1916, and international vice-president in 1920. During World War I he was a member of Pennsylvania's regional war labour board and served also on the National Bituminous Coal Production committee. In 1935 he was named to the National Industrial Recovery board and to the advisory council of the National Recovery administration. Murray was John L. Lewis' choice for second president of the C.I.O. after Lewis had fulfilled his pre-election promise of 1940 to resign if President Roosevelt was elected for a third term. Lewis, who continued to dominate the annual convention of the organization, personally nominated Murray, and the latter was elected unanimously Nov. 22, 1940, without an opposition candidate. Murray then announced that he would conform strictly to the policies outlined and followed by his predecessor.

Murray, however, did not follow Lewis during 1941 in the latter's bitter opposition to President Roosevelt's foreign policy. The new C.I.O. leader stood for aid to Britain (though he criticized certain parts of the lend-lease act and said the U.S. should be determined not to enter the war). By the time of the national C.I.O. convention in Nov. 1941, a split between the Lewis and the Murray forces was evident. Lewis' supporters, however, joined the other factions of the C.I.O. in re-electing Murray for a second term as president Nov. 21, 1941, at Detroit.

Murray, Samuel (1870–1941), U.S. sculptor, was born in June in Philadelphia, Pa. A pupil of Thomas Eakins at the Art Students league, he worked for a while as Eakin's assistant and became an art teacher in 1891. His works include the statue of Commodore Barry in Philadelphia, the Bishop Shanahan memorial in St. Patrick's cathedral, in Harrisburg, Pa., and the Pennsylvania State Battle monument at Gettysburg, Pa. He is represented in the Philadelphia Museum of Art and the Metropolitan and the Whitney museums in New York city. Murray taught life modelling and lectured on anatomy at the Moore Institute of Arts, Science and Industry in Philadelphia for nearly 50 years. He died in Philadelphia, Nov. 3.

Music. There is little doubt that the nineteen-forties were witnessing a renaissance of music in the western hemisphere. The growing interest and faith in American music, along with the eagerness of large orchestras, of opera companies and of smaller ensembles, also, to perform native music, has encouraged a musical production which, at least in quantity, surpasses that of any other single period in U.S. history. It is impossible to enumerate anything like the entire list of young composers coming into prominence or of the premières of their very creditable works. In the U.S. New York is no longer the only outstanding music centre—Los Angeles, Calif., is becoming more and more prominent, especially through the performances of the New Los Angeles Symphony under Werner Janssen, and the WPA orchestra under James Sample. Hollywood, Calif., Chicago, Ill., Indianapolis, Ind., and Washington, D.C., especially since the defense boom, are more and more in the news. The south, too, announces concerts, festivals, contests, first performances.

The 50th anniversary of the Chicago Symphony orchestra led to the writing of many important works commissioned for the occasion, notably, Stravinsky's *Symphony in C Major*, which was looked upon as the culmination of his orchestral writing. There was also a new *Symphony Number 3* by Leo Sowerby, and works by Casella, Rudolph Ganz and others. The year 1941

marks also the 100th anniversary of the oldest orchestra in the United States, the New York Philharmonic, which began its centennial season in October. There was a marked revival of interest in opera as evidenced by the organization of new opera companies, notably the New Opera company in New York, N.Y., which, like several others, aimed to give opera in English, at moderate prices, and to use American artists and performers. Further stimulus came from the commission of works by the League of Composers, the Juilliard School and the radio. Among works commissioned by the league in co-operation with the CBS were *The Lamp on the Plains* by Ernst Bacon, *The New York Opera* by Marc Blitzstein, *Solomon and Balkis* by Randall Thompson. Among the best radio scores was Virgil Thomson's for *The Trojan Women* of Euripides. Several other new works were well received, especially a new "socialist-labouristic" opera by Marc Blitzstein, *No For An Answer,* and a choral-operetta by the British composer, Benjamin Britten, *Paul Bunyan,* with text by the poet, W. H. Auden. The International Society of Modern Composers met in New York for the first time, and was distinguished from other meetings, also, in its use of radio for broadcasting of programs, but few works on the programs were acclaimed. In New York, N.Y., also, in addition to the many performances of works of Shostakovich, Hindemith, Schoenberg, Milhaud, etc., there was the world première of Bartok's *Quartet No. 6,* by the Kolisch quartet, and of his *Music for Strings, Percussion and Celesta* at the New School for Social Research. Notable among the works of native composers were William Schuman's *Third Symphony* and his choral work *This Is Our Times,* David Diamond's *First Symphony* and Samuel Barber's *Violin Concerto.* The League of Composers presented works of a young group: John Lessard, Ben Gossicke, Emil Koehler, Donald Fuller, Norman della Joio, Lukas Foss and Edward Cone. In Philadelphia, Pa. was given the première of Rachmaninoff's *Symphonic Dances* and of Bernard Wagenaar's *Symphony No. 3.* In Washington, D.C., the National Symphony orchestra presented a prize-winning work, the *First Symphony* of Arnold Cornelissen. In Cincinnati, O., there were presented a *First Symphony* by John Haussermann and Weinberger's *The Lincoln Symphony.*

In Rochester, N.Y. the Festival of American Music and the Symposium of American Music, both under the direction of Howard Hanson, presented many new works, notably a *First Symphony* by Robert Ward, a *Choral Variations and Fugue* by Carl McKinley, and *Overture for a Drama* by Ross Lee Finney. In Indianapolis, Ind., where the orchestra boasted 11 premières of American works, were given Carl Eppert's *Escapade,* Henry Cowell's *Purdue,* works by Harl McDonald, Carpenter, McCollins, etc. In Minneapolis, Minn. were presented under the leadership of Dimitri Mitropoulos, a new *Symphony* by Paul Hindemith especially commissioned for the Minneapolis Symphony orchestra, *The Life of Man* by John Verrall, and *Slow Piece* by Ross Lee Finney. Hollywood, Calif., through the WPA orchestra, and through the stimulus of the motion pictures presented many novel works and in San Francisco, Calif., the WPA Composer's Forum laboratory, organized by Ashley Pettis, who contributed so greatly to the achievement of the WPA in New York city, encouraged younger composers. In Los Angeles, Calif. appeared the names of Homer Simmons, Marion Ralson, and others. *Civic Center Suite* by Leigh Garline, which used adding machines and to which was added the wail of taxpayers, aroused interest, but Stravinsky's reharmonization of the "Star-Spangled Banner" brought little response.

Canada.—There were two main centres of Canadian creative activity. In Toronto, Ont., there were such able composers as Godfrey Redout, Louis Applebaum and John J. Weinzwerg, leaders of the radical movement in Canada. In Montreal, Que., in addition to Hector Gratton and the prodigy, André Mathien, there were the French-Canadian Maurice Blackhorn and Alexander Brott; also Barbara Pentland, from Winnipeg, Man. and Robert Fleming from Saskatoon, Sask.

Mexico and South America.—A subsidy provided by the Mexican government encouraged a musical activity in Mexico to which large numbers of visitors from the U.S. contributed. Both Cuba and Puerto Rico had a prosperous opera season, under the direction of D'Andria.

The year in South America was marked both by an interchange of artists between North and South America, and by the distinguished work of native South American composers. Burle Marx (Brazilian) played his own composition with the Detroit Symphony. Juan José Castro made his debut with the National Broadcasting company. The U.S. government promoted numerous good-will tours: Aaron Copland directed his own compositions in various South American cities. A wood-wind organization made up of North American composers, Robert McBride, Alvin Etler, Adolph Weiss, David van Vactor and John Barrows performed their works throughout South America and the Yale Glee club toured the continent. Buenos Aires, Arg., had the most imposing musical season. It was the 23rd year for the Teatro Colón, which produced at least two new native works: a one-act opera, *Lin Calel* by Armando D'Esposito and a ballet, *La Infanta,* by Alfredo Schuema. The Association of Argentine Composers presented works by Gilardo Gilardi, Eduardo Caba, Alberto Williams, among many. Celia Torra's Women's Orchestra and Choral society were prominent. There were many concerts in Bogotá, Colom.; in Montevideo, Urug.; in Santiago, Chile—which in 1941 celebrated the fourth century of its founding. There were three creative groups in Chile, the first, under Italian influence, was led by Enrique Soro and Melo Cruz, whose new opera, *Maurico,* was performed. The second, more national, was led by Humberto Allende. The third, known as the eclectic group, and headed by Domingo Santa Cruz, included Alfonso Leng. Lima, Peru, had also its own orchestral ensemble, directed by a German refugee and boasted its own native composers: André Sas, one of whose works was performed at the I.S.C.M. in New York, N.Y.; Theodoro Valcárcel, known for his ballet, *Suray-Surita;* Raoul de Verneuil. In Rio de Janeiro, Braz., *Malazarte,* a new opera by Oscar Lorenzo Fernandez was very successfully performed.

Europe.—In Europe the greatest musical activity appeared to be in England and in Portugal, where the influx of refugees stimulated both performance and composition. The San Carlos opera was restored and opened on Dec. 1, 1940, with a new opera by Ruy Coelho. Prominent artists were Arturo Santos, Gorge Kroner de Vasconcellos and Fernano Lopes Graca, an adherent of Schoenberg. English musicians performed some American works and in the fall showed an understandable interest in Russian music. Numerous premières were announced: a very serious and well received new symphony by Edmund Rubbra; Benjamin Britten's *Violin Concerto;* and works by Alan Rawsthorne, Alan Bush, Elizabeth Maconchy, etc. After the destruction of Queen's hall in London by bombing, the Promenade concerts were moved to Albert hall. The Sadler's Wells Opera company continued. Myra Hess (made a Dame of the British empire) gave daily concerts in the National museum. Concerts at rest centres—for people who were bombed out of their homes—at factories, and at air-raid shelters contributed a distinctive contemporary touch. Outside of London, Oxford was the primary music centre and had a performance by the Oxford Bach choir of Vaughan Williams' new work, *Serenade to Music* and a successful new opera by Vere Somerset, *The Imbroglio.* Orchestras and opera companies and artists, too, toured the provinces and small groups

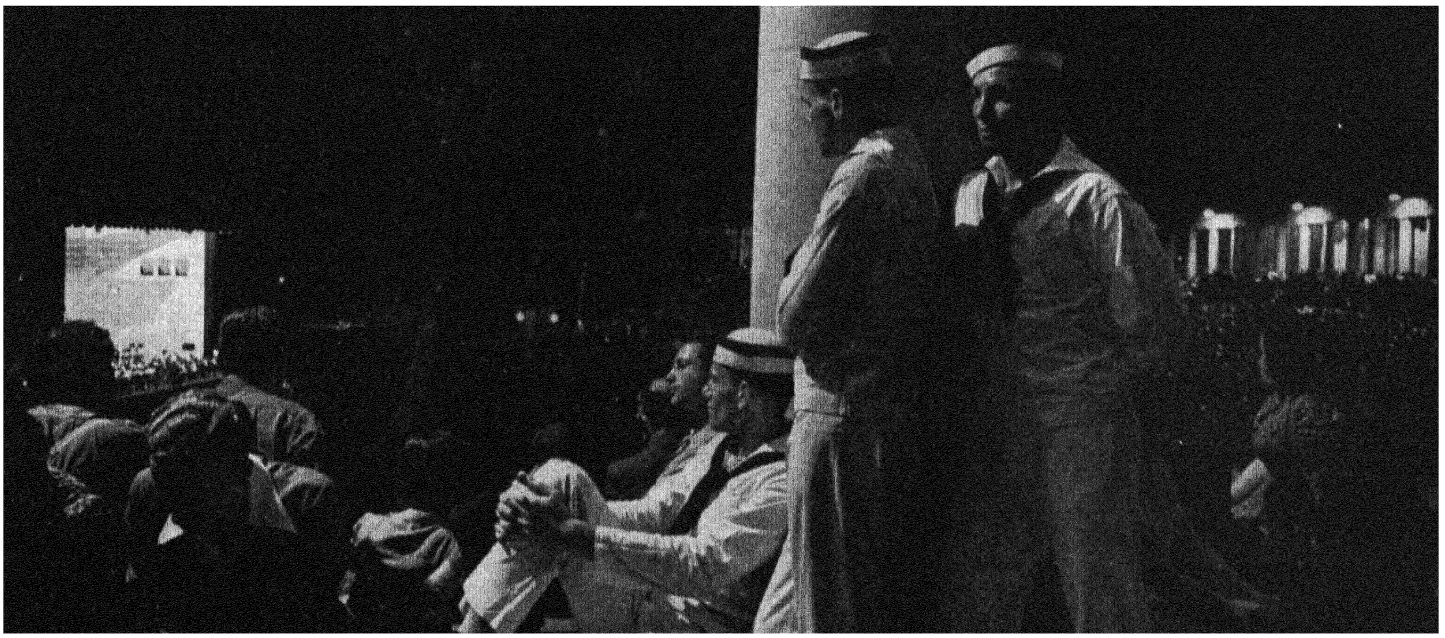
Above: MASTER AND YOUNG STUDENT of the harp at the National Music camp at Interlochen, Michigan, where some 350 children received training in 1941



throughout Britain organized choruses and women's choirs.

Musical life in Switzerland apparently continued normally, but with few innovations. The season for 1941–42, however, promised to be more interesting with premières announced of Kodaly's *Variations for Orchestra,* Casella's *Symphony,* Opus 63, a new *Symphony* for string orchestra by Honegger, a *Concerto for Violin* by Bohuslav Martinu, and a new oratorio by Willy Buckhard, *Das Jahr.* Radio Genève was preparing a première of *Naïades* by Pierre Girard and a young Genevese composer, Pierre Wissmer. In Italy Malipiero's opera, *Ecuba* was received with mild enthusiasm. The Germans in Paris apparently encouraged musical performances for the entertainment of troops of occupation, but the purge of Jewish performers and the scattering or execution of other French talent kept the concerts of low standard. Alfred Cortot was a member of the national council in Vichy, and was looked upon as the guardian of French culture. Georges Auric was in Paris. Wanda Landowska, the harpsichordist, abandoned her collections and instruments and moved to America. In Germany and in German-occupied Vienna, musical fare varied with Germany's military alliances and relationships.

Wagner was, of course, staple and Anton Bruckner was popular. The Italians were frequently played and many French works were permitted. There were performances of Kodaly and of Bartok. Enesco conducted in Vienna where Richard Strauss's operas were frequently heard. Eugen Suchon, a young Slovakian, was considered promising material. Berlin took the lead over Vienna in the field of opera, under Berlin Director Heinz Tietjen, and new works sponsored by the nazis appeared—*Die Zaubergeige* and *Peer Gynt* by Werner Egk; *Die Bürger von Calais* and *Johanna Balk* by Rudolph Wagner-Regeny.

Opera enlivened the Stockholm season, but there was only one première: Kurt Atterberg's entertaining *Aladdin.* The news from Russia indicated Shostakovich working on Leningrad defenses in the morning and composing a new symphony in the afternoon.

(R. L. Fy.)

Popular Music.—During the year 1941 popular music in America reached its lowest ebb. Radio's boycott of the American Society of Composers, Authors and Publishers (ASCAP) went into effect on January 1, and from then on all activity in this field was political rather than musical. (*See* Performing Right Societies; Radio: *Musical Property.*)

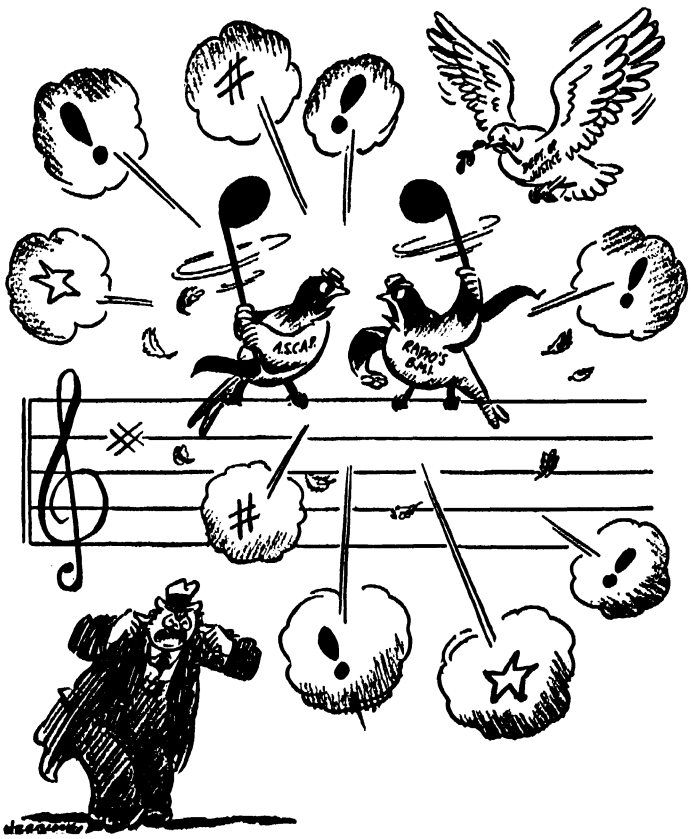
Judged by sales of sheet music, the song of the year was a revival, "Intermezzo," which had attracted little attention in the film of the same name, but later took full advantage of the lack of competition. Its melody, right out of Wagner's *Tristan und Isolde,* ran away from all the current makeshifts, and it was the only song to reach a total of half a million copies.

Its nearest rival in popularity was the fox-trot version of Tschaikovsky's *Piano Concerto* known as "To-night We Love." (More than a dozen transcriptions of this famous opening melody were in circulation, with "Concerto for Two" nearest to the success of the winner.)

Tschaikovsky appeared again in the "first 15" with "The Things I Love," based on the Russian composer's "Melody."

According to *Variety's* dependable report, the others in the select class were, in alphabetical order, "Amapola" (a revival), "Daddy, Do You Care?", "Frenesi" (an importation), the "Hutsut Song" (the nonsense ditty of the year), "I Don't Want to Set the World on Fire," "I Hear a Rhapsody," "Maria Elena," "My Sister and I," the "Shepherd's Serenade," "You and I" and "You Are My Sunshine." In the last few weeks of the year "The White Cliffs of Dover" suddenly developed into a huge hit and promised shortly to outstrip all the other songs of 1941.

An epidemic of war songs broke out with the declaration of more serious hostilities, but "God Bless America" held its own in the patriotic field. Musical comedy showed a solid success in the Rodgers-Hart *Pal Joey,* with Cole Porter's *Let's Face It* encroaching upon his *Panama Hattie,* while Kurt Weil and Ira Gershwin combined their talents effectively in *Lady in the Dark.* These were highlights in a singularly depressing year, in which "popular" music became definitely unpopular. (S. Sp.)



"OUR AMERICAN SONGBIRDS." Herblock of NEA Service pictures the lengthy dispute between the two licensers of U.S. radio music which began Jan. 1, 1941, with the withdrawal of all ASCAP music from most of the nation's broadcasting stations

Mussolini, Benito (1883–), Italian statesman and dictator. For his earlier career, see *Encyclopædia Britannica.* Il Duce chose June 10, 1940, as the propitious date for entering the war, doing so with the declaration that "our conscience is entirely clear." After a few desultory thrusts at defeated France he consulted with Hitler at Munich June 18 on the terms of peace. Italian military activities then remained in relative abeyance until the beginning of the campaigns in North Africa (Sept. 12, 1940) and in Greece (Oct. 28). Both these operations were soon thrown into reverse, and on Dec. 6, 1940, Mussolini reorganized his military command.

The events of Mussolini's career in 1941 fell into the same general pattern first set in 1940: conferences with Hitler; shakeups of the army; explanations of defeats; and threats against the common enemies of the axis. Early in the year he dismissed Gen. Ubaldo Soddu as commander of the Albanian forces; in February he admitted his defeats in Libya and Greece but told his people they could count upon German assistance; the next month he retired Rodolfo Graziani as chief of the Italian general staff. Meanwhile he had met again with Hitler (January) and with Franco (Feb. 12). On June 2 he conferred with Hitler at Brenner pass. Eight days later, with the Greeks safely out of the way, he made this declaration: "It is absolutely mathematical that in April, even if nothing had happened to change the Balkan situation, the Italian army would have overcome and annihilated the Greek army." In this same address he assured his listeners

that U.S. intervention would not alter the outcome of the war. After Italy had entered the war against the U.S.S.R., Mussolini paid a visit to the Russian front where, in late August, he held another five-day conference with Hitler. On Dec. 2 the Italian press revealed that 60 persons charged with plotting to assassinate Mussolini were under detention in Trieste. (*See* also ITALY.)

Mussolini, Bruno (1918–1941), son of Italian Premier Benito Mussolini, literally grew up with the Italian fascist movement. Trained to fight in his country's service, he became a licensed pilot at 17. A year later he flew with Italian squadrons raiding Ethiopia, and he was a squadron pilot when Il Duce's air force helped General Franco bomb loyalist cities in the Spanish civil war, 1936–39. During the lull between the end of the latter conflict and the beginning of World War II, young Mussolini helped organize the Italian air line to South America. The start of the second world conflict saw the Italian premier's son in the role of commander of a bombing squadron. He saw service in the Mediterranean and on the Greek front, and he engaged in raids over Malta. He was killed when a bomber that he had taken up on a test flight crashed as it was preparing to land at San Giusto airfield, near Pisa, Aug. 7.

Nagayo, Matao (1878–1941), Japanese bacteriologist and cancer expert, was born in April in Tokyo. He was graduated from the Tokyo Imperial university, of which he later became president (1935–38). Nagayo was director of the Tokyo Epidemic Research laboratory (1919–34), and dean of the medical faculty of the Tokyo Imperial university in 1933. The day before his death in Tokyo on Aug. 16, Nagayo was created baron by a court decree signed by the emperor.

Narcotics: *see* DRUGS AND DRUG TRAFFIC.

Natalie (1859–1941), queen of Serbia, widow of the Serbian king Milan Obrenovitch IV, was born May 2 in Florence, Italy, the daughter of Col. Ketchko, a Moldavian soldier in the Russian army. At the age of 16 she was married to Prince Milan, heir to the Serbian throne, and a son, Prince Alexander, was born to them a year later. Prince Milan, who had been placed on the Serbian throne under a regency in 1868, became king in 1882. But Milan incurred the enmity of his people with his pro-Austrian sympathies, his taxation policy and his unsavoury private life. No longer able to tolerate her husband's extravagance and scandalous conduct, Natalie left the court with her son in 1886 and found refuge in Wiesbaden. Two years later Milan recovered the custody of his son, circulated infamous rumours about his wife and secured a divorce. In 1889 Milan abdicated in favour of his son, Prince Alexander, and retired to Paris. Five years later a nominal reconciliation was effected between the royal couple, and Natalie returned to Serbia in 1895. After the assassination in 1903 of her son Alexander and his wife, Queen Draga, Natalie fled to France and lived for many years in Biarritz. She later entered the convent of Our Lady of Zion in Paris. Her death was reported from Paris on May 8.

National Academy of Sciences. The National Academy of Sciences was incorporated by act of congress in 1863 for the purpose of investigating, examining, experimenting and reporting upon any subject of science or art whenever called upon by any department of the United States government. Membership is by election, in recognition of outstanding achievements in scientific research, and is limited to 350 active members and 50 foreign associates. Members must be citizens of the United States.

At the annual meeting held in Washington, D.C., April 28, 29 and 30, 1941, 15 new members were elected as follows: Werner Emmanuel Bachmann, René Jules Dubos, Evarts Ambrose Graham, Arthur Scott King, Charles Christian Lauritsen, Alfred Lee Loomis, J. Robert Oppenheimer, John Thomas Patterson, Karl Sax, George Gaylord Simpson, Joseph Slepian, Lyndon Frederick Small, Wendell Meredith Stanley, Tracy Yerkes Thomas, George Bernays Wislocki. Three foreign associates were elected: Edgar Douglas Adrian, Archibald Vivian Hill and Sir Arthur Keith. At the dinner of the academy on April 29, 1941, the Henry Draper medal was presented to Dr. Robert Williams Wood, of Johns Hopkins university.

National Science Fund.—At the annual meeting in 1941, the academy established, under its charter, the organization for the National Science fund for the promotion of human welfare through the advancement of science. The National Science fund was to receive from individuals or others, donations, bequests, grants or other gifts of money to be expended in such manner as in the judgment of the board of directors of the fund would best promote human welfare through the advancement of science. The board of directors consists of the president and treasurer of the academy, the chairman of the National Research council and the president of the American Association for the Advancement of Science, during and by virtue of their office, together with additional members (both members and nonmembers of the academy) appointed by the council of the National Academy of Sciences. The fund was to be operated exclusively for scientific, literary, or educational purposes and no part of the net earnings of the fund was to inure to the benefit of any private individual, and no part of the activities was to consist in carrying on propaganda or otherwise attempting to influence legislation. The board of directors of the National Science fund have an office at 515 Madison Ave., New York city. The autumn meeting was held at the University of Wisconsin, Madison, Wis., on Oct. 13–15, 1941.

The academy publishes an annual report, biographical memoirs of its deceased members, occasional scientific memoirs and monthly *Proceedings*.

The officers of the academy in 1941 were: Frank B. Jewett, president; Isaiah Bowman, vice-president; L. J. Henderson, foreign secretary; F. E. Wright, home secretary; J. C. Hunsaker, treasurer and Paul Brockett, executive secretary. The academy building is at 2101 Constitution avenue, Washington, D.C.

National Debts. The national debt of a country generally refers to the total financial obligations of the state arising out of the issuance of public securities. It differs from public debt in that it includes only the obligations of the central government, whereas the public debt also covers obligations of local government units. The national debt usually indicates the extent to which the central government has resorted to borrowing over the years to make up the deficit between its expenditures for all government services and investments and its revenues from taxation and various minor sources. As the manner of keeping official accounts varies considerably from country to country, however, there are many exceptions to this definition. In the United States, for example, several agencies of government have been set up outside the budget, the Reconstruction Finance corporation (*q.v.*), the Home Owners' Loan cor-

poration (*q.v.*), the Federal Farm Mortgage corporation, etc., and their obligations are not included in the official figure of the national debt. On the other hand, obligations assumed by the state but not originating from a borrowing operation—such as war pensions or indemnities—have in many cases been included in official national debt statistics. The adjusted service bonds issued to veterans are an example of this type of obligation included in the United States national debt total.

Table I.—*Gross Debt of the United States, 1913–43*

June 30	(Millions of dollars)	June 30	(Millions of dollars)
1913	$ 1,193	1929	$ 16,931
1914	1,188	1930	16,185
1915	1,191	1931	16,801
1916	1,225	1932	19,487
1917	2,976	1933	22,539
1918	12,244	1934	27,053
1919	25,482	1935	28,701
1920	24,298	1936	33,545
1921	23,976	1937	36,427
1922	22,964	1938	37,167
1923	22,350	1939	40,445
1924	21,251	1940	42,971
1925	20,516	1941	48,961
1926	19,643	1942E	70,612
1927	18,510	1943E	110,421
1928	17,604		

Source: Data from 1913 to 1941 are from U.S. treasury department, daily treasury statement (revised); 1942 and 1943 are estimates reported in budget of the United States government for the fiscal year ending June 30, 1943 as presented to the congress by President Roosevelt.

While revenues in all countries have equalled or exceeded expenditures during many years in the past, the world-wide trend of national debts has been upward since borrowing became a recognized method of financing government expenditures. By far the most important factor in this upward trend has been the tremendous state expenditures required by modern warfare. Expenditures for the development of natural resources, usually by loans placed abroad, also have been a factor in some of the more recently settled territories. And during the decade 1932–41 public spending to relieve unemployment assumed major importance in increasing the national debts of some countries.

The history of the U.S. debt entered a new phase with the inauguration of the national defense program in the middle of 1940. Expenditures on the rearmament effort were soon rising so rapidly that not even the opponents of the administration suggested that the budget be balanced. New tax measures, calculated to increase revenues substantially, were passed by congress in both 1940 and 1941, but heavy borrowing was nonetheless necessary. By the end of 1940 the national debt reached $45,024,631,000, thus just exceeding the old statutory limit of $45,000,000,000, and by the end of 1941 the debt figure stood at $57,938,000,000.

The outbreak of actual war on Dec. 7, 1941, required that the rearmament program be transformed into a full war effort. For this effort to obtain an overwhelming superiority of war matériel to assure defeat of the axis forces, President Roosevelt recommended to congress in his budget message on Jan. 7, 1942, a total war expenditure for the ensuing fiscal year of almost $53,000,000,000, which he contemplated would take more than half of the national income. His recommendation included the largest tax program in United States history, a total of $27,000,000,000 of revenues, $9,000,000,000 of which were to be derived from new levies. Despite the contemplated increase in federal revenues, the president indicated what the full impact of the war would mean to the national debt by presenting estimates of the national debt at the close of the fiscal year 1942 of $70,612,000,000 and a debt total at the end of fiscal 1943 of $110,421,000,000.

It is interesting to note that during the first year and a half of the rearmament program, the president held to the fiscal ideas upon which his administration was based. In the budget message of 1941, he stated that such drastic taxation as would be required to finance the defense program on a pay-as-you-go basis would interfere with the full use of the productive resources. A year later he observed that, although some rise in prices had accompanied this policy, part of the price rise was desirable in that it facilitated the increase in the production required for an all-out war program. By that time, however, the president felt that extraordinary measures were needed to "aid in avoiding inflationary price rises which may occur when full capacity is approached." The president continued by explaining his reason for the increase in the national debt, despite his desire to avoid inflation:

"With expenditures and deficits multiplied, the threat of inflation will apparently be much greater. There is, however, a significant difference between conditions as they were in the fiscal year 1941 and those prevailing under a full war program. Last year defense expenditures so stimulated private capital outlays that intensified use of private funds and private credit added to the inflationary pressure created by public spending.

"Under a full war program, however, most of the increase in expenditures will replace private capital outlays rather than add to them. Allocations and priorities, necessitated by shortages of material, are now in operation; they curtail private outlays for consumers' durable goods, private and public construction, expansion and even replacements in nondefense plant and equipment. These drastic curtailments of nondefense expenditures add, therefore, to the private funds available for noninflationary financing of the government deficit.

"This factor will contribute substantially to financing the tremendous war effort without disruptive price rises and without necessitating a departure from our low-interest-rate policy."

The implication of this analysis is that the size of the national debt in itself cannot produce inflation, but that inflation results from a total flow of expenditures, public plus private, in excess of current production at current prices. In accordance with this analysis, it was being stressed that the sale of defense bonds to the general public should be aimed at reducing total spending.

As to the burden of this debt, it was estimated by the president that the annual interest charges would rise to about $2,500,000,000 at the end of the fiscal year 1943 from the 1940 level of $1,000,000,000. He stated further that paying $2,500,000,000 out of an extremely low national income would impose an excessive burden on taxpayers, while the same payment out of a $100,000,000,000 national income could be carried without undue hardship. The capacity of the nation to support the large debt total which

was in store was, therefore, conceived to depend upon the ability to maintain the level of employment and national income existing when the war ended.

Since 1941 was a year of war on three continents and of heavy armament expenditure throughout the world, national debts of all major countries were increased by substantial amounts. Reliable figures for many countries, however, were not available. For, in addition to the usual difficulty that reports are only made at the end of the fiscal year, the totalitarian powers suppressed, either entirely or in part, information on their fiscal operations.

Furthermore, little was known about government financial conditions in the conquered nations of Europe.

The national debt figures which were issued for a few major countries indicated, however, what occurred because of war conditions. The debt of Great Britain rose from £8,475,000,000 on Sept. 30, 1939 to £12,608,000,000 in Aug. 1941.

In Canada the national debt rose from $3,642,049,000 on March 31, 1939 to $4,744,057,000 two years later. An increase in the publicly revealed debt of Germany from r.m. 39,748,900,000 on Sept. 30, 1939 to r.m. 105,874,000,000 in July 1941 was made known, but these figures were of limited meaning (except insofar as they suggested the extent of the German war effort), because they did not represent the total government debt at either date.

In Table II are presented the national debts of various countries for the end of the latest fiscal year available. It should be kept in mind that these debt figures are not comparable with each other because of differences in the division of responsibility between the national and local government units from country to country, because of differences in size, wealth and population and because of differences in services rendered or investments made by government. Moreover, in these days of controlled exchange and trade, the conversion of local currencies into a common unit, such as the dollar, is exceedingly difficult. National Education Association of the United States was organized in Philadelphia in 1857. It has a membership of 211,191 and its affiliated state associations have a membership of 802,481. Much of the work of the association is carried on by its 60 departments, councils, commissions and committees. The membership of the larger departments in 1941 was: school administrators 4,439; elementary principals 6,267; secondary principals 7,409; music 9,309; health, physical education and recreation 10,231.

The association's winter convention was held at Atlantic City, Feb. 23–28, 1941; its general convention in Boston, June 29–July 3, 1941. The 1942 conventions were to be in San Francisco, Calif., in February and Denver, Colo., in July.

Among notable activities of the association during 1941 were: (1) Conferences held throughout the United States by the Educational Policies commission and the publication of its book *Education of Free Men in American Democracy*. (2) The appointment and staffing of a new commission on the Defense of Democracy through Education. (3) The widened observance of American Education week, Nov. 9–15, 1941, around the theme "Education for a Strong America." (4) The work of the Committee on New Voter Preparation and Recognition in developing Citizenship Recognition day, now observed each year the third Sunday in May, and the publication of the *American Citizens Handbook*. (5) The continued growth of Future Teachers of America and the publication of the *First FTA Yearbook*. Association headquarters are at 1201 16th St., N.W., Washington, D.C. The official organ is the *Journal of the NEA*, edited by Joy Elmer Morgan, and issued to all members monthly except during June, July and August. The president for 1941–42, Myrtle Hooper Dahl, teacher, Hiawatha school, Minneapolis, Minn.; executive secretary, Willard E. Givens. (*See* also EDUCATION.)

National Geographic Society. Organized in 1888 by a small group of professional geographers resident in Washington, D.C., this society has carried out its purpose as set forth in its charter of "increasing and diffusing geographic knowledge" by over a half-century of noteworthy original contributions in geography and its related sciences. In 1899, Gilbert Grosvenor, now president, assumed the direction of the organization's activities and broadened the scope of its researches in such a way as to appeal to the layman interested in scientific accomplishments. The success of this plan is evidenced in the growth of the membership of the society from less than 1,000 in 1899 to 1,175,000 in 1941.

Results of its participation in more than 100 expeditions have included the achievement of the world's altitude record in a manned balloon when Capt. Albert W. Stevens and Capt. Orvil A. Anderson ascended to 72,395 ft. in the "Explorer II" on Nov. 11, 1935, under the joint sponsorship of the society and the U.S. army air corps. In co-operation with Dr. William Beebe in explorations off the coast of Bermuda in Aug. 1934, the society established the world record for a deep-sea dive by man, 3,028 ft.

Deeply interested in America's past, the society has met with noteworthy successes in the field of archaeology. In 1941 the society joined for the third season with the Smithsonian Institution in excavations in Veracruz, Mex. The 1939 expedition found a stone stele engraved in Maya characters, with a date interpreted as 291 B.C. by the Spinden correlation, 31 B.C. by the Thompson correlation. By either correlation, this is the oldest dated work of man so far found in America. In 1940 the party uncovered five great carved stone heads. The 1941 expedition excavated the largest and finest cache of jade yet discovered in America. Matthew W. Stirling, as leader, and Mrs. Marion I. Stirling, as field secretary, were awarded Burr prizes of $500 each for their service in the Mexican expeditions.

A grant made in 1941 enabled Mr. and Mrs. William Albee to study and photograph in colour animal life in the Sierra Nevada of California. Investigations were also made during the year by staff members of the society who visited Australia, the Union of South Africa and India.

During 1941 Dr. Walter T. Swingle reported that he had named a new species of *Momordica* in honour of Dr. Gilbert Grosvenor, *Momordica Grosvenori*. The specimens of the plant were collected in 1937 by a society expedition to the region of Kwei-lin, China, led by Dr. G. Weidman Groff, who was searching for the source of the Chinese "lo han kuo," a widely used household medicine in southern China.

Results of the society's studies are published in the *National Geographic Magazine*. Special features of the magazine during the year 1941 included the reproduction in colour of eight paintings of the "Ships that Guard Our Ocean Ramparts," by Arthur Beaumont. Articles were published on everyday life in the army and navy of the United States.

In addition to its magazine, the society publishes a series of *Contributed Technical Papers*. The 1941 monograph in this series was "National Geographic Society-National Bureau of Standards Solar Eclipse Expedition to Patos, Brazil," a report on the total eclipse observed at Patos on Oct. 1, 1940.

World recognition has been awarded the large-scale, ten-colour maps prepared by the society's cartographic department. Maps published in 1941 included "Indian ocean, Australia, New Zealand and Malaysia," "Northwestern United States and Neighboring Canadian Provinces," "The Atlantic ocean," and "The World." (G. Gr.)

National Guard. The induction of the national guard, begun during 1940, was continued during the first half of 1941 until, when the final unit was inducted on Oct. 6, 1941, the national guard of the several states had contributed to the armed defense of the nation 18 combat divisions and other formed units totalling: 20,455 officers, 221 warrant officers and 279,358 enlisted men. The divisions reported for duty at strengths averaging approximately 10,000 men, received increments of conscripts almost as large as themselves and found their first duty was to train these recruits and weld them into the combat force, drawing upon their own experienced skill and practical leadership developed during the two decades beginning in 1920.

Compiled figures show that 5,964 officers and 2,130 enlisted men of the national guard had during this 20-year period graduated from special or general service schools of the army. Sixty-three per cent of the officer graduates were in service in 1941. When it is remembered that the national guard of the 1920s was largely officered by World War I veterans and that increasing age alone removed many of these from the rolls, the number remaining is considered large. The officer corps of the national guard upon induction was consequently a judicious mixture of seasoned veterans and enthusiastic youths of modernized military education.

When congress, on Aug. 18, 1941, authorized extension of active service beyond the "12 consecutive months" originally provided in 1940, enlisted guardsmen and drafted men in these units were held over, except certain categories of advanced age or personal dependency; officers remained at their duties, except those whom rigorous field service standards eliminated. Between midsummer and the end of the year, all national guard units participated in a series of successive field manoeuvres with and against regular army troops and proved their mettle. As the year closed, problems were being considered for the release of personnel individually, to make way for the training of new men and to build up in each of the separate states a mass of qualified and classified personnel as a reserve for field forces, but the declaration of war in December caused such releases to be stopped and men released to be subject to recall to their units.

Under an act of congress approved Oct. 21, 1940, moves began to replace these units in their home communities by state guard units to provide local defense in frontier areas and to protect communities against domestic disturbances beyond the power of police to control. By the end of the year such forces, armed by the federal government, uniformed by the states, and enrolled as volunteers without pay, had reached a strength of 105,812 officers and men. (J. F. Ws.)

National Income. With the basic stimulus provided by the huge rearmament program, the national income of the United States in 1941 made the largest single year increase in the nation's history and rose to a new high record. As compared with the 1940 total of $77,200,000,000, the preliminary estimate of the national income for 1941 was $94,500,000,000, a rise of over one-fifth. The magnitude of the 1941 figure for this most comprehensive measure of the country's economic activity may be better realized when set against the World War I boom peak of $69,800,000,000, or the former high record of $83,365,000,000 reached in 1929.

Meaning of National Income.—Proper use and interpretation of national income statistics require an understanding of the concept upon which their compilation is based. The national income measures the net value of the economic goods and services currently produced by the private and public enterprises of the nation. Almost every word in this definition has a special meaning for the purpose of national income compilation and conditions the character of the estimates. National income represents the "net" value of output, for example, in that only the output of final products is included. This means that raw materials and services used up in the production process and business charges for depreciation and depletion are excluded. Taxes paid by business to all government units, whether passed on to the consumer in the form of higher prices or not, are also excluded. The estimates, moreover, are limited to "economic goods and services"; thus, those goods produced outside the market place, such as the services of housewives, are not included. Furthermore, only "currently produced" goods are included in the concept. In consequence, such income receipts as relief, unemployment benefits, pensions, gifts, capital gains or losses and gains from illegal activities are excluded. Finally, the activities of both "private" and "public" enterprises are included, that is, productive activities of government agencies as well as business units. It is well to realize that the national income is not simply the sum of the money income of all persons in the nation, such as might be reported for income tax purposes. In the first place, it includes the income of corporations, apart from capital gains and losses, that is not distributed to individuals. In the second place, it includes only such receipts of individuals as are derived from currently rendered services, with receipts of both money and commodities being taken into account.

Changes in National Income Since 1919.—Estimates of national income from 1919 to 1941 are shown in Table I. The changes in this series over the years reflect primarily the fluctuations in the value of economic activity that occurred. It will be noted that the economic boom associated with World War I reached its high point in 1920. There followed a sharp and short liquidation in 1921 and then an almost continuous upsurge of economic activity during the prosperous '20s, with a new high for

†Preliminary.

national income in 1929 that was not to be surpassed until 1941. The magnitude of the disastrous depression of the early '30s may be seen in the fact that the national income was more than halved between 1929 and 1932. From this low level, substantial progress was made in raising the national income to a total of almost $71,000,000,000 in 1939, a mark well below the average for 1926–29 in dollar terms. The period of economic recovery from the bottom of the depression to the last year of peace in Europe was marked by recession in 1938.

This brief account of the movement of national income in the United States between the two great wars relates to the net value of output in current dollar terms. The estimates, consequently, are affected by the general level of prices as well as by the physical quantity of goods and services produced. Since for many purposes the physical quantity of national production, or real national income, is required, a series depicting this volume is also shown in Table I, average prices of 1935–39 being used as a base. Entirely adequate price information for adjusting the national income in current dollar terms is not available, but the estimates in Table I are sufficiently accurate for most purposes. There are two interesting points to be observed in connection with these estimates of real national income.

The first is that the year-to-year changes in the total are considerably less violent than in the estimates of national income in current dollars. The depression of 1921, for example, was largely accounted for by a drop in prices rather than by a decline in physical output of goods and services. The depression of the early '30s was also partly a result of price movements, although in this instance the decline in real income was very substantial. On the other hand, the recession of 1938 was to a lesser degree accounted for by a decline in prices. It may be noted, however, that the volume of output after adjustment for price changes was higher in 1939 than in 1937, whereas the reverse was true of national income in current dollars.

Table II.—*U.S. National Income by Industrial Origin*

(In 000,000,000s of dollars)

Industry	1929	1932	1937	1939	1940	1941*

Not Allocated	4.0	2.4	3.2	3.4	3.6	4.4

Source: U.S. department of commerce. *Preliminary.

The second is that the comparison between the general level of national output in the '30s as against the '20s is more favourable to the latter decade if real output is used than if the money value of output is used. In other words, the lower level of the national income in the '30s is partly accounted for by the lower prices prevailing in that period. It is most striking, for example, that the real national income in both 1937 and 1939 exceeded that of 1929. Furthermore, the real national income in 1939 was 50% above 1919, whereas the current dollar value showed less than a 5% increase. This large rise in real output is a reflection of the increase in the capital and labour resources being utilized in the productive process and also of the tremendous advances in productive efficiency occasioned by technological development. So far as the importance of the latter factor is concerned, it is significant that the larger quantity of output in 1939 over 1919 was achieved with a smaller percentage utilization of the available productive capacity of both men and machines.

In assessing the importance of the rise in national income over time, it is also essential to take account of the increase in population. As population rises, there are, of course, more persons to share in the goods being produced for present and future consumption and also more hands available for contributing to total output. The changes in income produced per capita after adjustment for fluctuating prices are shown in Table I. Real income per capita in 1937 and 1939 was about equal to the per capita real income in 1927 and 1928. It did not exceed the level reached in 1929 although the difference between 1929 and 1939 was relatively small. In comparing the change from 1919 to 1939, it may be noted that about half of the 60% rise in aggregate real income represented a gain in per capita income.

Rise in National Income after 1939.—The outbreak of World War II marks 1939 as the end of a definite phase in the economic life of the nation. For, as the dramatic and swift invasion of the Low Countries and the conquest of France revealed the unpreparedness of the United States in the face of possible aggression, a huge rearmament program was undertaken. This was to have a powerful influence on the level of economic activity and, consequently, upon the size of the national income. The stimulus provided by the defense effort was already evident in 1940 when the national income rose more than $6,000,000,000, even though the program was not inaugurated until the middle of that year. It was not until 1941, however, that the full impact of the rearmament program became apparent. For in that year, as previously noted, the national income rose by $17,000,000,000. The magnitude of the advance occasioned by the armament effort might, perhaps, be better realized from the fact that the national income increased from an annual rate of approximately $75,000,000,000 in June 1940 to about $104,000,000,000 in Dec. 1941. Since the economic system at that time was operating with much less than the full potential of the labour power that could be utilized in the productive process, and since the necessities of modern war demanded an all-out effort requiring the full use of available labour, it was confidently expected that the national income would rise well above the Dec. 1941 rate in the course of the war effort. This could be accomplished through an increase in the number of gainfully employed persons, an increase in working hours and the utilization of new productive facilities. The data in Table I show that rising prices were not without their influence on national income in 1941, even though the large part of the rise represented an increase in real income. In comparison with a rise in current dollar income of more than 20%, the rise in real income was about 15%.

Table III.—*U.S. National Income by Distributive Shares*

(In 000,000,000s of dollars)

Shares	1929	1932	1937	1939	1940	1941*

Source: U.S. department of commerce. *Preliminary.

As already mentioned, the dynamic element that pushed the national income forward at so rapid a rate after June 1940 was expenditures for war material, both by the U.S. government and by foreign governments. The relative totals of these armament expenditures were less than $2,000,000,000 in 1939, approximately $4,000,000,000 in 1940, and about $15,000,000,000 in 1941. Because of this rapid rise, war or defense expenditures were taking an increasing share of the national income over this period, despite the rapid rise in national income itself. In 1940 the defense expenditures of the government alone represented less than 4% of the national income while in 1941 they represented about 15%. In fact, by the end of that year expenditures for the war effort represented about 20% of the current flow of national income.

In addition to the sharp advance in the output of war goods, however, there had been up to the last quarter of 1941 a substantial increase in the output of civilian goods for both consumption and capital purposes. The rise in output of consumers' goods in 1941 was estimated at over $8,000,000,000, part of which was accounted for by the increase in prices that occurred in that year. But, as the priorities and allocation system increasingly shut off the supply of materials for civilian uses, particularly in durable goods lines, it was evident that real curtailment in nonmilitary output was in store for the duration of the war. The president announced in his budget message to congress that the war effort would take about one-half of the national income in the fiscal year 1943 and, while the

total income would be much larger by that time, it was easy to see that goods available for civilian uses would necessarily be reduced.

It should be pointed out that the percentage of national income represented by war expenditures, though a reasonably good shorthand symbol for indicating the progress of the war effort on the economic front, is not a strictly accurate comparison. It can lead to serious misconceptions when the percentages of the various countries are compared. Firstly, the national income represents the net value of current output, whereas war expenditures represent sums of money actually paid and are, in this sense, a gross value aggregate. Even more important for international comparison is the fact that the national income represents only the output currently produced, whereas defense expenditures include purchases out of the existing stock of capital both at home and abroad. For example, the high figures of close to 60% representing the percentage of war expenditures to national income in Great Britain and Germany were possible only because a sizeable part of the defense expenditures was offset by liquidation of existing capital and purchases outside the territorial confines of those countries. In the case of Great Britain, the purchases out of the current national income would be more nearly in the neighbourhood of 40%. Since the United States had limited possibilities for purchasing abroad and since the pressure for liquidating domestic capital was much less, it was not to be expected that the percentage of national income represented by war expenditures would be as large as in Great Britain or Germany.

Industrial Origin of National Income.—An analysis of the industrial origin of national income is presented in Table II. The figures for each industry represent the net product of that industry, that is, the products of other industries used by each is excluded from the total representing the various industrial categories. For example, the coal utilized in manufacturing is shown as a product of mining and not in the net value of manufacturing output.

Considering that the impetus to the expansion of the national income since 1939 came from outlays for armaments and armament-producing facilities, it is not surprising that the output of the manufacturing and contract construction industries increased more substantially than that of other areas of the economy. As against an increase in total national income from 1939 to 1941 of a third, the net value of manufacturing output rose almost 70% and that of contract construction more than 75%. In this regard, the armaments boom was similar to the durable goods investment booms of earlier periods. It is also evident from Table II that the rearmament program continued the upward trend of the net output of government that had been one of the major characteristics since 1930.

Distributive Shares of the National Income.—An analysis of the national income in terms of the shares distributed or accruing to the various factors of production is presented in Table III. As the distributive shares represent, in a sense, the costs of producing current output of goods and services, they are in total necessarily equal to the national income which measures the net value of current output.

The changes in the distributive shares of the national income since 1939 were similar to those which usually characterize an upswing in economic activity. Salaries and wages increased by the largest absolute amount, primarily because they account for so large a fraction of total income. On a percentage basis, the largest advance of the period was in net income of corporations, despite the sharp rise in federal tax liabilities. Since net corporate income can fluctuate from negative to positive values, it is the most volatile element in the national income over the course of the business cycle. It should be kept in mind that this breakdown of distributive shares is not designed for throwing light on ethical questions of the size distribution of income and is not readily adapted to that purpose. One of the main reasons for this is that the various capital returns are all net in one sense or another, whereas salaries and wages represent gross income. The net income of corporations, for example, is shown after deductions for taxes, but not after taxes paid by the dividend recipient.

International Comparison of National Income.—Comparison of national income from one country to another is a difficult task because the concepts of national income used are not always similar and because prices prevailing vary widely from one country to another. In Table IV is presented the national incomes of various countries with the income statistics all converted to a common unit of purchasing power. They are taken from Prof. Colin Clark's book, *The Conditions of Economic Progress*, published by Macmillan. Inasmuch as the total income of any country is partly a reflection of its comparative size, Professor Clark has also calculated the national income per head of employed population. This measure provides a fairly good indication of the differences in productivity among the various nations. National Labor Relations Board.

In its sixth year, the National Labor Relations board in 1941 was summoned to a period of its greatest activity by the necessity of meeting labour problems in expanding U.S. defense industries. There were presented to the board in excess of 11,000 cases—nearly 5,000 more than in the year 1940. The only other year in which there was as great a recourse by workers to the National Labor Relations act was in 1938, the year in which a pent-up flood of cases was brought to the board following the upholding by the supreme court of the constitutionality of the act.

The year 1941 was also distinguished by a remarkable increase in the use of the board's machinery to conduct employee elections. The question of employee representation in previous years had been raised in about one-third of all board cases, while the other two-thirds concerned charges of unfair labour practice. In 1941 the representation cases brought to the board were twice those of the previous year and for the first time outnumbered the unfair labour practice cases brought to the board.

The board as early as March announced that it would give priority of handling to defense cases. The need of employers to know with whom they should bargain, and the pressure for recognition of majority bargaining rights in many defense plants, made speed in handling such cases a first concern. The board was able to conduct elections in an average time of three weeks from the filing of a petition for an election to the balloting itself, and in many cases the period was reduced to one week. The holding of elections by consent of all parties, instead of a public hearing and a board determination, obtained in four cases in five and contributed to the speed of their handling.

The year was likewise notable for the ending of litigation against several big employers charged with unfair labour practice. Compliance with board decisions was in each instance followed either by board elections or pay roll checks to determine employee representation, and in several outstanding cases written trade agreements resulted.

Among the large elections held in 1941 were those at the Ford Motor company, involving more than 80,000 workers at the Lincoln and River Rouge plants; Republic Steel corporation, involving 40,000 workers at 15 plants; Bethlehem Steel company, involving 72,000 workers at 26 plants; Inland Steel corporation, involving 12,000 workers and Youngstown Sheet and Tube company involving 20,000 workers. Each of these companies subsequently made collective bargaining agreements with the union certified as the bargaining representative.

During the year 1941 the board made important administrative changes. A field division was created and made responsible for administrative work in the board's 22 regional offices and for administrative case work.

For the expeditious handling of uncomplicated representation cases the board instituted a new policy of assigning regional office employees as trial examiners to hear such cases. Further savings of time and reports of better quality were secured by attaching attorneys to assist trial examiners in the preparation of intermediate reports, and by transference of cases to the board immediately upon the filing of intermediate reports.

The staff of the board remained the same in size, with approximately 450 employees in Washington and 350 attached to the 22 regional offices. Approximately four-fifths of all cases were closed in regional offices, the great majority of these by informal methods and without holding public hearings.

The board's litigation record for its first six calendar years stood at the end of 1941 as follows: Board orders enforced in full or with modification by the supreme court, 32; board orders denied enforcement by the supreme court, 2; supreme court cases involving other questions: 6 decided favourably to the board, 1 decided unfavourably; petitions by employers for review of circuit courts of appeals decisions favourable to the board: 51 denied by the supreme court; petitions by the board for review of circuit courts of appeals decisions unfavourable to the board: 3 denied by the supreme court. During the six years, the circuit courts of appeals enforced in full or with modification 242 board orders and denied enforcement of 56 board orders. (*See* also LABOUR UNIONS; STRIKES AND LOCK-OUTS.) (H. A. Ms.)

National Lawyers' Guild.

The national executive board, at its October meeting, invited the collaboration of the American Bar association, the National Bar association and all other national associations of lawyers, to mobilize the skill and training of the entire bar for participation in the military, economic, social and civil activities necessary to carry on the war. Similar proposals were made by chapters to local bar associations in their respective communities. The committee on taxation issued and distributed two booklets analyzing the existing federal tax structure and proposing amendments to existing tax laws to provide more adequate revenue by reaching sources better able to pay. The Philadelphia Neighborhood Law Office project successfully concluded its experimental stage and it was decided to continue this legal service for persons in the low income group as a permanent institution.

The officers of the guild elected at the fifth annual convention in Detroit were: President, Judge Robert W. Kenny; executive secretary, Martin Popper. The editor of the official publication, the *Lawyers' Guild Review*, was Benjamin Algase. (M. PR.)

National Monuments: *see* NATIONAL PARKS AND MONUMENTS.

National Parks and Monuments.

The silver jubilee of the National Park service was celebrated in 1941. While Yellowstone was set aside

is a national park in 1872, it was not until 1916 that the National Park service was created as a bureau of the department of the nterior. During the 25th anniversary of this event, the National Park service gave close scrutiny to operations in relation to the charge made by the creative legislation—"to conserve the scenery ind the natural and historic objects and the wild life therein, ind to provide for the enjoyment of the same in such a manner ind by such means as will leave them unimpaired for the enjoyment of future generations." These mandates outline the fundamental purposes of the national parks and present a delicate problem in keeping a proper balance between preservation and use.

In addition to the maintenance and operation of 164 federal park areas in 1941, the National Park service made further progress in the park, parkway and recreational area study which had been in progress for several years. Also, through the Civilian Conservation corps, assistance was given to the planning, development and improvement of state, county and municipal parks.

Under the Historic Sites act, Fort Raleigh in North Carolina, San José mission in San Antonio, Tex., and the Oregon City home of Dr. John McLoughlin were designated as national historic sites. Also, congress authorized the Coronado International memorial on the United States-Mexican border contingent upon the reservation of an equal amount of land by the republic of Mexico.

Texas appropriated $1,500,000 for the purchase of privately owned lands in the Big Bend National Park project, a big step toward the preservation and protection of this great area along the Rio Grande.

During 1941 more than 21,000,000 persons visited the national park areas. Included in this total were 335,000 members of the U.S. armed forces who were invited by the secretary of the interior to make use of the parks for scenic trips, historical tours and recreation, with all entrance fees waived.

With the challenge of national defense before the nation, the National Park service continued to make the national park areas of service to the people for public appreciation under proper safeguards and for building of pride in the U.S. national heritage.

The wisdom of national park and monument preservation is measured not so much in terms of the number of visitors as in their benefit from the experience. The comments of millions of visitors show that the highest and fullest enjoyment can be had only if the natural and scenic features are preserved and if the historic, prehistoric and scientific resources are fully safeguarded. Primitive wilderness characteristics in the national parks give to them a grandeur which will add increasingly to their distinctiveness as these qualities disappear elsewhere. (N. B. D.)

VISITORS TO "OLD FAITHFUL" in Yellowstone national park in the summer of 1941. An all-time record total of 581,761 persons visited the park during the fiscal year Oct. 1, 1940–Sept. 30, 1941

National Youth Administration.

The National Youth administration provides unemployed young men and women with practical experience and training designed to prepare them for jobs in private industry, and also enables students in schools and colleges to earn the money they need to continue their education.

During the month of October 1941 approximately 544,000 young people were employed on the work programs of the National Youth administration, of whom 294,000 were students employed by the NYA while attending schools and colleges, and 250,000 were out-of-school youths employed on work projects.

The out-of-school program of the NYA was geared to meet the demands of the bottleneck defense industries for experienced and trained workers. In NYA workshops and resident centres young people were given on-the-job training in such jobs as welding, sheet metal work, aviation mechanics and electrical work. Working under factory conditions NYA youth developed not only skills and techniques but also work habits necessary for defense employment. During the 12 months of 1941 more than 400,000 out-of-school youths secured jobs in private employment, primarily in national defense industries.

The National Youth administration was established by executive order of the president on June 25, 1935. Originally set up within the Works Progress administration, the NYA was transferred to the Federal Security agency on July 1, 1939.

The National Youth administration operates on a decentralized plan, with a state youth administrator in each state, as well as in Alaska, District of Columbia, Hawaii and Puerto Rico, who has a major share in the planning and direction of the program. A national advisory committee, representing industry, labour, education, religion, agriculture and youth, advises the president on policies and activities affecting the NYA. There are advisory committees in every state and in about 1,000 local communities which assist in fitting the NYA to local needs and conditions. Administrator of NYA in 1941: Aubrey Williams.

From its establishment through June 1941 the National Youth administration provided jobs for 1,772,000 out-of-school youths and provided jobs for 1,803,000 students to enable them to work their way through schools and colleges. (A. Ws.)

Navies of the World.

An inevitable result of the widespread war at sea was to give an impetus to the development of new tactics, new types of ships, new weapons and new methods of using them.

So severe were German submarine losses in the early months of World War II through the efficiency of the British "Asdic" detection gear that new tactics were subsequently followed by the U-boats. Instead of attacking in submerged condition during daylight, their depredations were usually carried out on the surface at night, when their low silhouette was not easily spotted.

To meet this menace, the star-shell, originally devised to light up destroyers attacking a fleet under cover of darkness, was being used extensively to reveal submarines trying to torpedo merchant vessels in convoy.

New, or rather modified, types of warships included the corvette, which is a cross between the "whaler" of World War I and the fast patrol vessels known in those days as "P-boats." Corvettes were turned out in hundreds for the royal navy and royal

Canadian navy and proved themselves invaluable for the work of escorting convoys across the Atlantic. Another type developed considerably in scope and design was the motor torpedo boat. Germany knows these craft as *schnellboote,* though the practice of referring to them as "E-boats" puzzled the public, who imagine them to be much more formidable than the reality. Before the war the Italians were proud of their vessels of this category, officially classed as M.A.S. (*motoscafi anti-sommergibili*), but these had accomplished singularly little. In the abortive attack on Valetta harbour, Malta, they lost heavily.

Yet another type which underwent development is the anti-aircraft ship. British cruisers of the Dido class are primarily designed for anti-aircraft duties, and a number of obsolescent destroyers were rearmed for the same purpose. On the German side one heard frequent mention of "flak" ships, which mostly appeared to be trawlers and other vessels of mercantile type armed with high-angle guns.

New weapons included the magnetic and acoustic mine, both of which were largely laid by aircraft. Torpedo attack from the air underwent extensive development, although it was in the experimental stage during World War I. The disabling of the Italian fleet at Taranto in Nov. 1940 and the crippling of the German battleship "Bismarck" in May 1941 were outstanding examples of the success of torpedo attack from the air.

The year 1941 witnessed the appearance of three new British and two new American battleships of 35,000 tons, outweighing the almost simultaneous completion of two German units of somewhat heavier type (about 40,000 tons), one of which was brought to action and destroyed.

Aircraft carriers proved their value repeatedly in connection with the British torpedo attacks from the air already referred to, as well as in the bombing of naval bases and in repelling enemy air attacks in the Mediterranean. Nothing had been seen at sea up to the closing months of 1941 of the two aircraft carriers which the Germans were building when war began. One of them had certainly been completed, but from the fact that no use had been made of it, it may be surmised that it either proved unsatisfactory, or received serious damage which disabled it.

An American aircraft carrier was completed during 1941, and in addition to 11 under construction, two or three merchant ships had been taken in hand for conversion into "escort aircraft carriers."

In cruisers the inferiority of the axis powers was manifest. It appeared as if Germany had only three heavy and three light cruisers left in service, and one of the former was blockaded at Brest, France. Italy might still have possessed three heavy and ten light cruisers of modern design. Against these slender forces the British fleet could muster more than twice as many of the former and four times as many of the latter.

The United States navy had a heavy program of cruiser construction in hand, which would ultimately more than double its effective strength in that category. It included half a dozen vessels which, from the meagre particulars that were available, would apparently be battle cruisers of a new and powerful design.

Very little could be said about the Japanese navy. This was because, so far as the veil of secrecy which enshrouded it could be penetrated, progress with the construction of new ships was latterly being very slow. This was doubtless owing to the shortage of steel and other materials needed for the completion of the four or five battleships and sundry other vessels that were in hand.

Though its geographical situation was not favourable, the Russian navy appeared to have been actively engaged in the Baltic, Black sea and Arctic ocean during the latter half of 1941. Its operations were largely concerned with the interruption of enemy convoys carrying troops and supplies, and in bombarding enemy land forces at such points as Tallinn, Kronstadt and Odessa. Russian naval aircraft were also busy and claimed some successes. Submarines, of which the soviet government could dispose of a large number, were used with effect in the Baltic.

This brings into consideration the number of underwater craft in the axis fleets. Though the losses of both were heavy, there is little doubt that the Germans were continuing to build submarines in large numbers. According to a Swedish estimate, there were seldom less than 150 at sea, excluding those under refit.

In Italy the position might have been different, since losses were not believed to have been made good to any appreciable extent.

British submarine construction remained a secret, but the names of sundry new vessels not provided for when the war began were published from time to time. In the U.S. navy, construction was proceeding rapidly, the number of new submarines in hand amounting to nearly two-thirds of those already in service. Japan was believed to be building as fast as circumstances permitted, influenced in this respect no doubt by Germany's example.

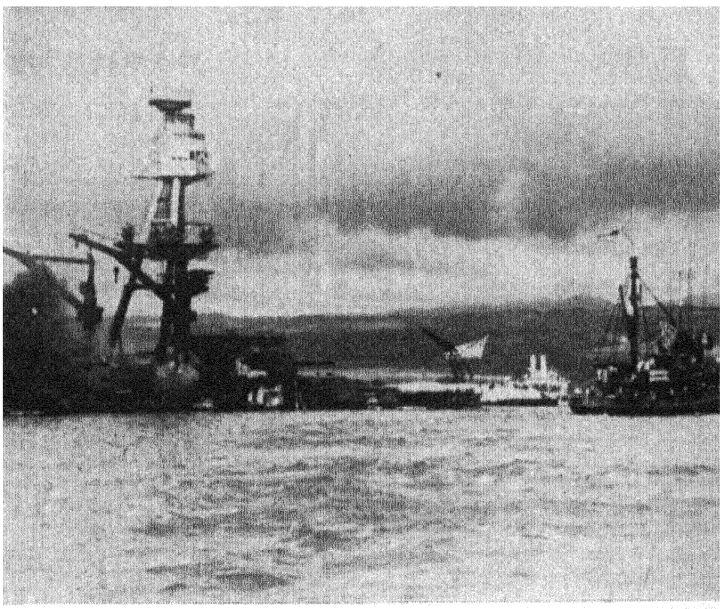
British Naval Strength.—Before summing up the strength of the royal navy in ships at the end of 1941, it may be well to take a glance at the losses incurred since the war began in Sept. 1939. These comprised 4 capital ships, 3 aircraft carriers, 13 cruisers, 2 of which had been rearmed for anti-aircraft duties, 59 destroyers (including 3 of those transferred from the U.S. navy), 32 submarines, 1 fast minelayer, 6 sloops, 5 fleet minesweepers, 1 monitor, 5 gunboats, 8 corvettes, 128 trawlers, 16 drifters, 14 armed merchant cruisers, 13 armed yachts, 7 auxiliary minesweepers, 2 fleet tugs and 18 miscellaneous auxiliaries.

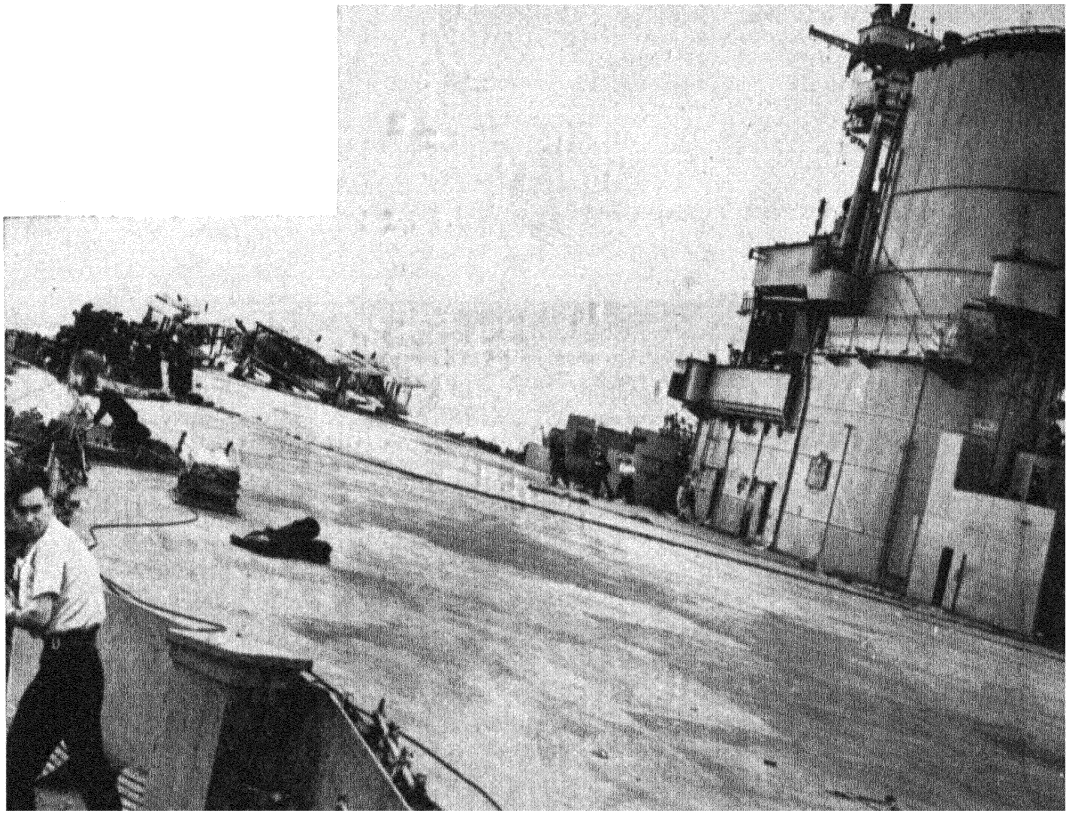
After allowing for these losses, and for such new ships as were known to be due for completion by the end of 1941, the strength of the royal navy in Dec. 1941 might be reckoned as not less than 13 battleships, 1 battle cruiser, 7 first line aircraft carriers, 67 cruisers (of which 14 were heavy ships with 8-in. guns), 4 minelayers, more than 260 destroyers, 52 submarines, 47 sloops, about 100 minesweepers, about 200 corvettes, 3 aircraft tenders, 2 netlayers, 2 monitors, 17 river gunboats, 6 coastal minelayers and a very large but unstated number of motor torpedo boats and motor gunboats. Trawlers, drifters and mercantile auxiliaries of all descriptions were too numerous for an estimate to be possible.

Of ships on order at the outbreak of war there were probably still in hand 6 battleships, 2 aircraft carriers and 4 cruisers. Naturally a great many more cruisers, destroyers and smaller craft must have been put in hand since.

Naval forces of the dominions, including the royal Indian, royal Australian, royal Canadian and royal New Zealand navies, as well as the Newfoundland and South African naval forces, are included in the above figures. Their personnel was known to have been increased greatly since war began, amounting to more than 15,000 for the royal Australian navy in 1941, while the royal Canadian navy expected to reach a total of 28,000 in 1942. Canada, it should be added, was building small warships, such as corvettes and mineswèepers, in large numbers, not only for its own service but also in some measure for the royal navy. Australia, besides providing for its own needs, was constructing corvettes for the royal Indian navy.

United States Naval Strength.—The biggest program of naval expansion in the history of the United States, designed to produce a "two-ocean" navy, was in full swing. Ships in service at the end of 1941 were: 15 battleships, 7 aircraft carriers, 18 heavy and 19 light cruisers, 179 destroyers, 111 submarines, more than 30 gunboats and patrol vessels, more than 100 submarine chasers, 20 seaplane tenders, 8 light minelayers, about 40 motor



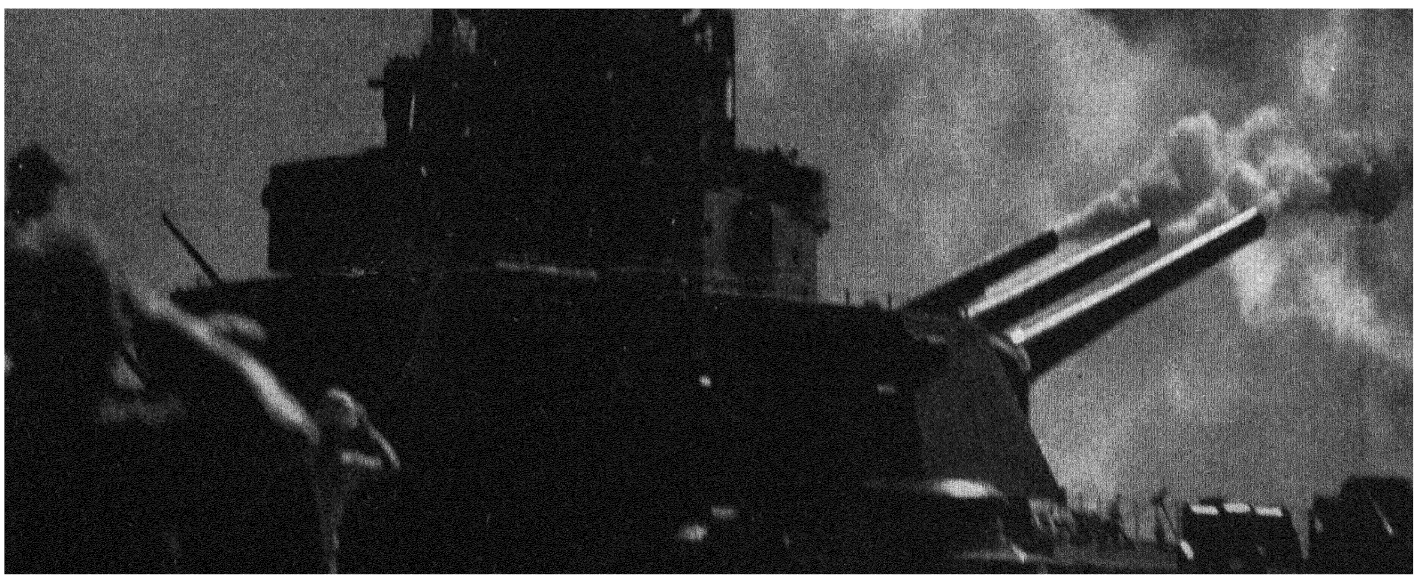


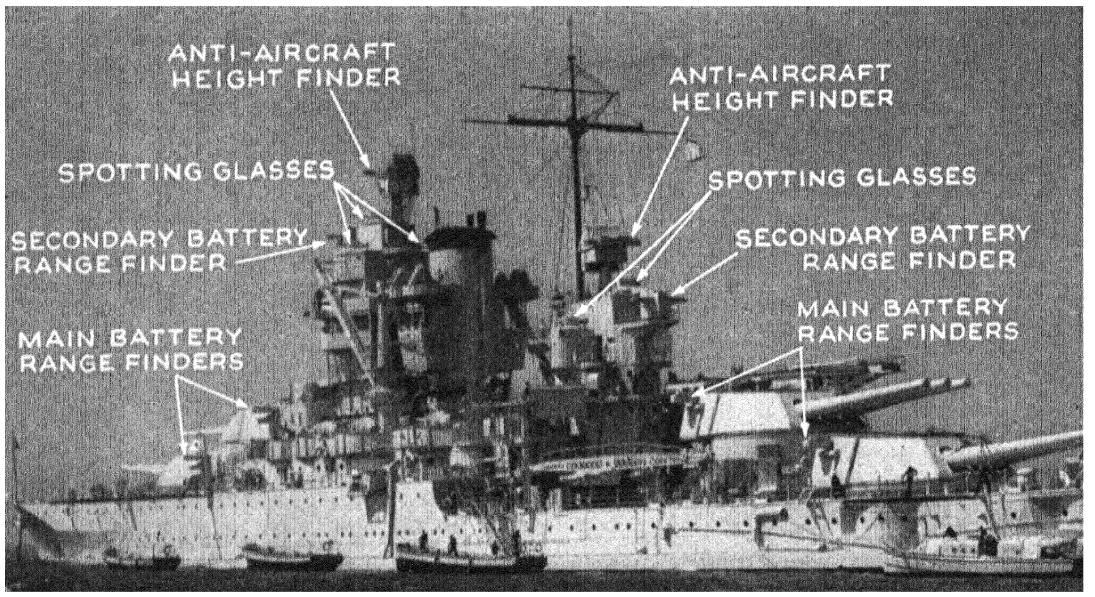
Above, left: SURVIVORS OF THE "BISMARCK" bobbing in the open sea May 27, 1941 after the great German battleship, victor over Britain's 42,000-ton "Hood" three days previously, was sunk by British gunfire and torpedoes

Above, right: THE U.S.S. "Arizona" resting on the bottom of shallow waters in Pearl Harbor, Hawaii, after it had been destroyed in the Japanese aerial attack of Dec. 7, 1941. Its flag is still flying.

Right: LISTING FLIGHT DECK of the British aircraft carrier "Ark Royal" shortly before the ship sank in the Mediterranean Nov. 14, 1941. It was torpedoed by an axis submarine off Gibraltar.

Below: THE MIGHTIEST SALVO in naval history was fired by the new U.S. battleship "North Carolina" in 1941. During a test at sea all nine of the ship's 16-in. guns, as well as ten 5-inchers, were fired simultaneously. The picture shows the guns of the rear turret during the test





LOCATION OF RANGE and height finders and salvo-spotting glasses aboard the U.S. battleship "Idaho"

torpedo boats and nearly 100 minesweepers.

Under construction or on order were 15 battleships, 6 battle cruisers, 11 aircraft carriers, 8 heavy and 40 light cruisers, 192 destroyers, 73 submarines, 19 seaplane tenders, 3 minelayers and more than 100 minesweepers, the exact number depending upon the rate at which these were completed.

A great many auxiliaries were also under construction or were being fitted out after being taken over from mercantile employment. It was hoped to have a total naval personnel of 369,000 by June 1942, besides 75,000 marine corps. (*See* also MUNITIONS OF WAR.)

Japan.—Though the utmost secrecy was preserved concerning new naval construction in Japan, it was believed that at the end of 1941 there were in service 10 battleships, 8 aircraft carriers, 12 heavy and 23 light cruisers, 108 destroyers 12 seagoing torpedo boats, more than 80 submarines, 6 aircraft tenders, 5 coast defense ships, 17 submarine chasers, 20 minelayers, 18 minesweepers and 14 gunboats.

Under construction were 4 or 5 battleships, 3 or 4 armoured ships resembling the German "pocket battleships" in design, 1 or 2 aircraft carriers and an unknown number of destroyers, submarines, minesweepers and submarine chasers. Personnel had been largely increased and was probably about 250,000.

France.—The French navy was split up to such an extent that its full strength could hardly be assembled. There were 8 battleships, of which 3 were in Algerian, Moroccan and West African ports, 1 demilitarized at Alexandria and two with the Free French forces; 1 aircraft carrier immobilized at Martinique, W.I.; 18 cruisers, of which 2 were in the far east, and in the West Indies, respectively, and 4 demilitarized at Alexandria; 53 destroyers, of which 7 were not available for service under the Vichy government; 11 seagoing torpedo boats, 5 of which were with the Free French; 68 submarines, of which 5 were unavailable; 2 coast defense ships; 2 minelayers; 1 netlayer; 1 aircraft tender; 7 sloops; and an uncertain number of patrol vessels, minesweepers and submarine chasers. Little or no new construction appeared to be in hand.

Italy.—After allowing for losses, Italy's effective strength amounted to 5 battleships, 3 heavy and 8 light cruisers, 2 obsolete cruisers of little fighting value, less than 40 destroyers, less than 50 seagoing torpedo boats, a residue of submarines, the total of which could not be determined without knowing the number lost, 2 sloops, 1 of which was in the far east, 1 aircraft tender, 9 minelayers, less than 40 minesweepers and sundry small craft of little importance, including perhaps 60 motor torpedo boats.

Germany.—German losses at sea had been heavy and its strength was reduced to 3 battleships, 1 of which was in the Baltic and 2 at Brest, France, 2 armoured ships ("pocket battleships"), 1 aircraft carrier, 3 heavy and 3 light cruisers, about 20 destroyers, about 30 seagoing torpedo boats, 1 sloop, 2 coast defense ships and an unknown number of submarines, motor torpedo boats and minesweepers, these being the vessels on which Germany was chiefly relying for carrying on the war.

U.S.S.R.—In spite of its entry into the war, very little more was known about Russia's navy than before. It included 3 obsolete battleships, 2 of which were in the Baltic and 1 in the Black sea, 1 aircraft carrier, 6 cruisers, 2 of which were in the Baltic and 4 in the Black sea, about 60 destroyers, about 20 seagoing torpedo boats, nearly 200 submarines and about 150 motor torpedo boats. Vessels in the last two categories were divided among the Baltic, Black sea and far east.

Other European Countries.—The Netherlands government had at its disposal, for service against the axis, 5 cruisers, 8 destroyers, 20 submarines, 3 sloops, 1 coast defense ship, 7 minelayers, 11 minesweepers and 13 motor torpedo boats. Many of these vessels were in the East Indies. In that territory the Prince Bernhard fund had collected money for the construction of a destroyer and a number of motor torpedo boats.

Norway retained, under the control of its government in London, a modern torpedo boat, a submarine and sundry small craft. A few vessels of small importance fell into German hands, but their fate since was unknown. In the case of Denmark, whose entire fleet fell into the hands of the invaders in April 1940, the only vessels which the enemy was definitely known to have manned were 6 small torpedo boats. This left under nominal Danish control 2 coast defense ships, 11 torpedo boats, 12 small submarines and some other ships of little importance.

Sweden was busily engaged in adding to its existing fleet, which comprised 2 cruisers, 8 coast defense ships, 9 destroyers, 10 seagoing torpedo boats, 16 submarines, 1 minelayer, 42 minesweepers and 6 motor torpedo boats. Two cruisers, 6 submarines and some other vessels were under construction, but 2 coast defense ironclads, which it was proposed to build, had not been laid down.

In the Finnish navy, so far as could be ascertained, there were a coast defense ship, 5 submarines, 10 minelayers, 7 motor torpedo boats and sundry small craft. Poland, with the addition of new ships built in England, had 5 destroyers, 5 submarines and some small craft, though 3 of the submarines were interned in Sweden.

Spain could utilize 6 cruisers, 16 destroyers, 6 submarines, 6 old torpedo boats, 6 minelayers and 2 sloops. Portugal possessed 5 destroyers, 3 submarines, 1 seagoing torpedo boat and 7 sloops. Turkey had an old battle cruiser, 4 destroyers, 7 submarines, 2 obsolete cruisers used for training purposes, 5 minelayers and 3 motor torpedo boats.

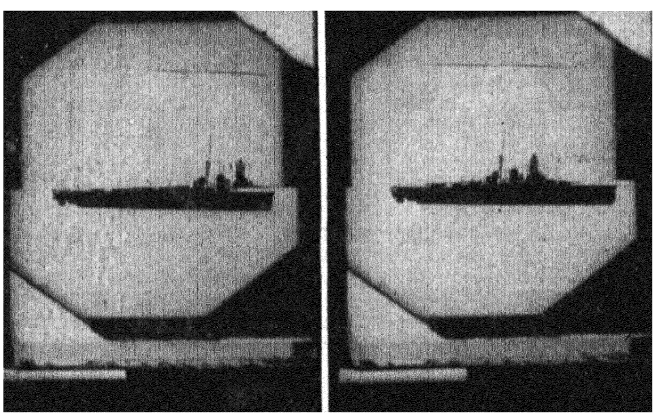
In spite of heavy losses suffered during the German invasion, the government of Greece still retained on active service 1 cruiser, 6 destroyers, 5 submarines and 3 old torpedo boats.

Rumania had, prior to the German attack on Russia, 4 destroyers, 3 submarines, 2 minelayers, 3 motor torpedo boats and 3 old torpedo boats and some vessels of minor importance. Presumably all of these were under Germany's control. One of the destroyers was reported to have been sunk in action.

In the Yugoslav fleet there were 4 destroyers, 4 submarines, 10 motor torpedo boats, 8 obsolete torpedo boats, 1 patrol vessel and some minor warships. Most of these, if not scuttled, were believed to have fallen into Italian hands.

South America.—Though the war had suspended all construction in Europe of warships for South American states, some of them were building ships in their own dockyards, notably Argentina, Brazil and Chile. The Argentine navy included 2 old battleships, 3 cruisers, 15 destroyers, 3 submarines, 4 old coast defense ships, 14 minesweepers and a few other vessels of little importance. Two sloops were under construction. In the Brazilian fleet there were 2 old battleships, 2 cruisers, 1 destroyer, 6 torpedo boats, 4 submarines, 8 minelayers and 2 minesweepers. Nine destroyers were under construction at Rio de Janeiro. Chile had 1 battleship, 3 cruisers, 8 destroyers and 9 submarines. A sloop was being built. Other South-American navies had altered little. Peru possessed 2 cruisers, 2 destroyers and 4 submarines. Colombia had 2 destroyers and 3 gunboats. Mexico could muster 5 sloops and some patrol craft; Cuba, 2 sloops and some small gunboats; Uruguay had a sloop and 3 patrol vessels; Venezuela, 4 gunboats. Paraguay had 3 river gunboats; Haiti, 2 tiny patrol vessels; the Dominican Republic, 3 patrol vessels and Nicaragua 1.

Asia.—China had had its navy extinguished as the result of the Japanese operations, but the puppet government of Wang Ching-wei had been



FINDING THE CORRECT RANGE of a target at sea through the eyepiece of a warship's range finder. When the target is out of coincidence (left) the range is incorrect; the finder is then adjusted until the image of the target is in coincidence (right)

*Full details not available owing to war conditions.
†Including 2 "pocket battleships."

presented with some salvaged and patched-up warships by its Japanese overlords. These comprised 2 cruisers, 1 sloop and 7 miscellaneous gunboats, so far as could be ascertained.

The navy of Thailand (Siam) was in action against a French squadron in the early days of 1941, suffering some losses as a result. It still included 4 coast defense ships (one of which was driven ashore but was believed to have been refloated), 1 destroyer, 10 torpedo boats, 3 submarines, 2 sloops and 8 motor torpedo boats, besides smaller vessels. There was no news of the 2 cruisers which were ordered in Italy before the war, and it was doubtful whether they would ever be finished.

Though some of its ships were badly knocked about in resisting the British landing, Iran had 2 sloops and 4 gunboats, besides a few smaller craft. Manchoukuo still had an ex-Japanese destroyer of an early vintage, and a collection of gunboats and patrol vessels numbering about 30, most of which were on river service. This also applies to the employment of 4 patrol vessels maintained by the government of Iraq.

As already explained, only those countries concerned in World War II were able to dispose of the necessary materials for naval construction at the time of writing.

For convenience of reference Table I shows the strength in the principal categories of warships of the navies of the world at the end of 1941. Nebraska, One of the states formed from the Louisiana purchase, Nebraska lies in the lower Missouri valley in the west north central part of the United States; admitted to the union in 1867; area, 76,653 sq.mi.; population, 1940, 1,315,834, a decrease of 62,129 from 1930; capital, Lincoln (81,984). In 1940, 39.1% of the population was urban. In 1930 the Negro population numbered 13,752 and the foreign-born, 115,346.

History.—State officers for 1941–43 were: governor, Dwight Griswold; lieutenant governor, William E. Johnson; auditor, Ray C. Johnson; secretary of state, Frank Marsh; treasurer, L. B. Johnson; chief justice, Robert G. Simmons. Alone among the 48 states Nebraska has a one-house legislature, the 43 members of which are chosen for two-year terms on a nonpartisan ballot.

Education.—Elementary and secondary education is under the control of local school districts, of which there were more than 7,000 in 1941. The total enrolment in elementary and secondary schools in 1940 was 276,188 and the teaching staff numbered 13,759. Expenditures amounted to $20,427,683. Higher education is supported by the state at the University of Nebraska and in four teachers' colleges. Total enrolment at the state university for 1940–41 was 12,129, of whom 9,061 were resident students of collegiate grade. The faculty numbered 500. The biennial appropriation for 1941–43 was $8,028,775 (including federal grants). Total enrolment at the teachers' colleges in 1940–41 was 4,037; the teaching staff numbered 210. The state appropriation for 1941–43 was $1,420,759.

Public Welfare, Charities, Correction.—The appropriation for public assistance for 1941–43 was $20,285,362. During the year ended June 30, 1941, the recipients of general relief numbered 122,714 and total monthly payments averaged $1,161,835; persons on WPA projects totalled 245,768 and received a total monthly average of $12,917,399; during the same year a monthly average of 1,722 children received $165,092 in payments under mothers' pension laws, and more than 700 blind persons received $171,422 in blind pensions. The state maintained seven correctional institutions with a total of 1,244 inmates in 1941, and ten others for dependents with a population of 6,541; 3,043 inmates were on parole in 1941. During the biennium 1939–41, total expenditures of the 17 institutions amounted to $6,581,205; the total appropriated for 1941–43 was $4,865,179.

Communications.—The total highway mileage of the state in 1941 was 100,162. Of this, 11,220 mi. had been designated as part of the state system of highways and 9,000 mi. had been marked and were maintained by the state. Of this latter figure 3,804 mi. were hard surfaced, 4,784 gravelled and 412 of earth. The total sum obligated for new construction during 1939 and 1940 was $16,099,657. As of Nov. 1, 1941, there were 48 airports and landing fields in the state, most of them managed by the municipalities. Railroad mileage in the state in 1940 was 6,044. Twelve radio stations operated from points within the state in 1941.

Banking and Finance.—State banks numbered 285 on June 30, 1941. Total assets were $89,360,630. There were also 50 building and loan associations with assets of $57,671,000; 11 industrial loan and investment companies with resources of $2,827,300 and 173 co-operative credit associations with assets of $3,370,675. National banks at the same date numbered 133 with resources of $311,271,000.

The total assessed value of the state in 1941 was $1,949,775,725. The tax rate for state purposes was set at 2.71 mills, which is calculated to produce $5,283,892. The biennial budget for 1941–43 carried appropriations of $60,909,869, of which $15,600,600 is from federal grants. There is no state tax on personal or corporate incomes, nor on sales. The state

Table I.—*Leading Agricultural Products of Nebraska, 1940 and 1939*

Crop	1940	1939
Corn	106,900,000 bu.	82,032,000 bu.
Wheat	34,821,000 bu.	34,376,000 bu.
Oats	35,700,000 bu.	20,576,000 bu.
Barley	22,544,000 bu.	14,651,000 bu.
Potatoes	11,340,000 bu.	9,720,000 bu.
Sugar beets	910,000 tons	790,000 tons
Hay	2,364,000 tons	2,463,000 tons

had no debt in 1941, though that of the local subdivisions amounted to $77,926,000. This does not include the debt of the public power and irrigation districts, amounting to somewhat more than $60,000,000.

Agriculture.—In 1940 the total acreage harvested was 15,309,000. Cash income was $278,468,000, divided as follows: Crops, $51,346,000; livestock, $180,826,000; government payments, $46,296,000. A large annual deficiency in rainfall during the period 1931–41 was reflected in a sharp decline in the cash income of producers. (*See* Table I on page 471.)

Manufacturing.—The value of all manufactured products in 1939 was $273,524,500. In that year 1,161 establishments employed 3,642 salaried persons and 18,810 wage earners and paid salaries and wages amounting to $28,135,500.

Table II.—*Principal Industries of Nebraska, 1939 and 1937*

Industry	Value of products	
	1939	1937
Meat packing	$117,713,576	$112,708,382
Creamery butter	21,133,891	23,291,846
Flour and mill products	17,485,317	25,524,100
Poultry dressing and packing	8,807,209	5,949,909

Mineral Production.—The state has no mineral wealth of consequence. Petroleum was discovered late in 1939 and by Aug. 1, 1941, 44 wells had produced 1,226,875 barrels. This, however, is not a significant portion of the national output. (L. W. L.)

Necrology: *see* OBITUARIES.

Negroes (American).

The war emergency called forth in 1941 increased pressures upon the federal government and its various agencies for remedial steps concerning racial discrimination, particularly in defense employment and in the armed forces. Considerably more progress had been made by the close of 1941 in the industrial field than in the military services, although some few gains in army policy materialized, principally in increased officer and officer-training quotas, in the commissioning of a few Negro field and coastal artillery units, and the authorization, after considerable Negro participation in the civil aeronautics program, of an air field and a limited air-corps training program (99th pursuit squadron) at Tuskegee. In industrial matters, nondiscrimination employment orders were promulgated covering the WPA defense projects, and a presidential order admonishing private industry similarly was followed by the appointment of a bi-racial federal "Fair Practices Employment Commission," authorized to investigate complaints relating to such discrimination by private concerns working on government defense orders. The presidential action was taken after the organization in June of a protest march on Washington under A. Philip Randolph, the Negro labour leader, which was called off in deference to the potential gains under the gradual enforcement of the order. Local protests also succeeded in some employment gains, in Washington, Chicago and especially in New York municipal and private transportation (subways and buses).

In civil rights, the U.S. supreme court reversed the unfavourable I.C.C. order refusing to compel railroads to provide accommodations of equal quality where separate transportation is in practice, a suit brought by Congressman Mitchell; the closed Democratic primary was again challenged (in process) in the U.S. circuit court in Texas; and following successful salary equalization proceedings in Delaware, Kentucky and Maryland, teacher salary campaigns were started in eight southern states practising such differentials. In Georgia, Governor Talmadge's dismissal of several officers of the state university for alleged advocacy of equal educational facilities for Negroes and whites provoked widespread protest from educational foundations and accrediting agencies. Suits for annulment of restrictive residential covenants in Philadelphia and Washington, D.C. were initially lost and appealed to higher courts. Adam C. Powell, Jr. was elected member of the New York City council.

Census figures indicated, as a result of adverse economic and social conditions, a fourfold more rapid decline of the rural Negro population, and the pressures of this forced and rapid urbanization loomed as a serious need for enlarged economic opportunity in industry and diversified employment. Negative symptoms of the situation began to appear in centres like Chicago and New York in the increase in relief and dependency figures as well as delinquency rates for Negroes.

Educational and Cultural.—The *Crisis* annual survey of education reported 4,964 college graduates out of a total of 39,993 college students. There were 310 masters and 11 doctoral degrees; 40 Rosenwald fellows in various fields of science, social science, art, music and education; a Guggenheim fellowship award to Richmond Barthe, the sculptor and the publication of notable books. (*See* BIBLIOGRAPHY.) A national network series (NBC) devoted to Negro participation in American life was successfully inaugurated under the supervision of Dr. Ambrose Caliver and under the auspices of the U.S. office of education, the Rosenwald fund and the Southern Education foundation. Marian Anderson received the $10,000 Bok award for outstanding achievement by a Philadelphian, and announced the gift as the nucleus of a foundation, recently incorporated, for the education of promising Negro singers and artists. Numerous exhibits of the works of Negro artists took place under the auspices of the American Federation of Arts, the Southside Community Art centre of Chicago and the Downtown Gallery of New York; and the Migration Series of Jacob Lawrence, a talented young artist, was featured in the November issue of *Fortune*. Richard Wright, whose novel *Native Son*, successfully dramatized by himself and Paul Green, was presented in New York and on the road by a mixed cast headed by Canada Lee, was chosen the 25th Spingarn medalist. A Negro extravaganza, *Cabin in the Sky*, starring Ethel Waters, was successful in New York and on continental tour. Wm. Grant Still's orchestral ballad, *Plain Chant for America*, to the libretto of Katharine Chapin, was inaugurated by the New York Philharmonic, and Dean Dixon, a talented young Negro conductor, rose to unusual recognition conducting the NBC orchestra, the Stadium Concerts' orchestra and the New York NYA orchestra in a series of concerts. The Southside Community Art centre, in Chicago, sponsored by a Negro Citizens' committee in co-operation with the Illinois Art project, was dedicated May 7 by Mrs. Eleanor Roosevelt.

Harvard university protested vigorously the athletic exclusion policy of the Naval academy, and voted to discontinue athletic relations with schools having such policies; later, Navy broke its custom for the first time in playing Cornell with Sam Pierce as member of the Cornell football team.

Nelson, Donald Marr

(1888–), U.S. business executive, was born Nov. 17 at Hannibal, Mo. and was graduated from the University of Missouri in 1911. The next year he was employed by Sears, Roebuck and company as a chemical engineer. In 1927 he was appointed general merchandise manager of the company, in 1930 vice-president in charge of merchandising, and in 1939 executive vice-president and chairman of the executive committee. On May 29, 1940 Nelson was appointed full-time acting director of the U.S. treasury's procurement division. On June 28, 1940 he was named co-ordinator of national defense purchasing in co-operation with the advisory commission of the Council of National Defense. Four months later he became head of the commission's priorities division.

In the Office of Production Management (*q.v.*), created Jan. 7, 1941 by President Roosevelt, Nelson was appointed director of the division on purchases and thus assumed responsibility for buying billions of dollars of material for the defense program. On Aug. 28, 1941 he was named executive director of the Supply Priorities and Allocations board (*q.v.*) and priorities director of the OPM. Many persons, including Bernard Baruch, hailed the appointment and interpreted it as a step toward the long-awaited vesting of absolute authority for the defense program in one man.

The interpretation was correct. On Jan. 13, 1942 President Roosevelt announced that he would create a new War Production board to supplant the SPAB and would appoint Nelson chairman of the board, with supervision over all agencies of war production. The president's statement added that "his (Nelson's) decision as to questions of procurement and production will be final." Nelson thus received executive powers equivalent to those of Baruch in World War I. Immediately thereafter the Office of Production Management was abolished, and the powers and activities previously exercised by it were taken over by the War Production board.

Nepal. An independent kingdom (area *c.* 54,000 sq.mi., est. pop. 5,600,000) lying between India and Tibet—and including Mt. Everest—ruled in fact by the prime minister, Maharaja Sir Joodha Shumshere Jung Bahadur Rana. In 1941 no change took place in the personnel or methods of government. The prime minister and *de facto* ruler remained steadfast in his friendship for Britain, despite the wave of pessimism which followed the German successes in Europe. He confiscated all private wireless receiving sets in the country, on account of the effect on the public mind of the German broadcasts. The active assistance which the Nepal government gave to the British arms was substantial. It assented readily to its Gurkha regiments being sent overseas if necessary, and it raised several additional battalions for the Indian army, recruiting several times as many men as in ordinary years. The maharaja also contributed generously to various war funds and charities. The British envoy, Lt. Col. G. L. Betham, resides at the capital, Kathmandu (pop. *c.* 80,000).

(ME.)

Nernst, Walter (1864–1941), German physical chemist, was born June 25 at Briesen, West Prussia. Among his many inventions was the microscale which could indicate a weight of one-millionth of a milligram, and could detect the presence of gold in sea water. He died at his country estate near Muskan, Germany, Nov. 18. (See *Encyclopædia Britannica.*)

Nervous System. The selective service act found specialists in nervous and mental diseases prepared to assist in examining conscripts. Actually, the inadequate conditions under which they were permitted to work indicated no great progress since the selective service of World War I. Discussions and written articles among the large body of specialists revealed little advance in knowledge regarding war neuroses, their cause and treatment. Even the old terminology of neurocirculatory asthenia and effort syndrome was revived. However, Kardiner's study of chronic war neuroses with convulsive and vegetative symptoms showed that early and adequate treatment is essential for the prevention of permanent sequels. Among drafted men, psychiatric disorders stood only second to dental troubles as a cause of rejection from active service.

Experimental Neurosis.—Experimental neurosis in animals can be produced under specific conditions. Sheep, dogs and pigs develop neurotic behaviour when the tasks before them are too great for their individual discriminatory capabilities. The physiology of such states indicated that the chronic condition is perpetuated by an endocrine imbalance.

Vitamins.—Overenthusiasm regarding vitamin deficiency as it affects the nervous system has been replaced by sober knowledge. Vitamin E_1 (tocopherol) and B_6 (pantothenic acid) are ineffective therapeutically in degenerative diseases of the nervous system. Vitamin A causes nervous symptoms only by pressure of exuberant bone growth on the spinal cord and nerve roots. B_1 (thiamin) continues to be important in peripheral neuropathies.

Shock Therapy.—According to statistics, insulin shock therapy for schizophrenia is much less effective than the original anticipation. Electric shock superseded metrazol in the treatment of affective disorders (melancholia). Curare or magnesium sulphate used intravenously decreases the severity of the convulsions. Brain damage from the treatment consists largely in small haemorrhages and gangliac cell degenerations. Prefrontal lobotomy as a means of treating pathological anxieties was still in a controversial state. Profound mental deterioration, hemiplegic states and epilepsy are disastrous sequels. (*See* also PSYCHIATRY.)

Poliomyelitis.—The greatest advances made in the study of any single disease in 1941 occurred in poliomyelitis. The National Foundation for Infantile Paralysis, through generous subsidy of research workers, showed how adequate financial support of existing U.S. talent hastens the progress of knowledge. The epidemiology, portals of entry, methods of extension and immunological reactions of the virus of poliomyelitis were becoming clearer so that we might anticipate the discovery of preventive measures in the near future. (*See* also ENDOCRINOLOGY; INFANTILE PARALYSIS; MEDICINE; VITAMINS.)

BIBLIOGRAPHY.—A. Kardiner, *The Traumatic Neuroses of War* (1941); O. D. Anderson and R. Parmenter, "A Long Term Study of the Experimental Neurosis in the Sheep and Dog," *Psychosomatic Med. Monograph*, vol. ii (1941); "Infantile Paralysis," a symposium delivered at Vanderbilt university (April 1941), published by the National Foundation for Infantile Paralysis.

(R. R. G.)

Netherlands. A kingdom of northwest Europe, bounded N. by the North sea, E. by Germany, S. by Belgium and W. by the North sea; occupied by German armed forces in May 1940. National flag, red, white and blue, in equal horizontal stripes. Area 13,440 sq.mi.; pop. (est. April 1, 1941) 8,932,369. Chief towns (pop. Dec. 31, 1938): Amsterdam (cap. 793,526); Rotterdam (612,372); The Hague (prewar seat of the government, 495,518). Language: Dutch; religion: Christian (1930 census, Dutch Reformed Church, 2,732,333; Roman Catholic, 2,890,022). Ruler, Queen Wilhelmina; president of the council of ministers, Prof. P. S. Gerbrandy.

History.—Queen Wilhelmina and her cabinet continued their domicile in England during 1941. Early in the year Dr. E. N. van Kleffens, foreign minister, and Hr. Ch. J. I. M. Welter, minister for the colonies, on the way to the Netherlands East Indies, visited Secy. of State Cordell Hull in Washington. Discussions on the general situation and on internal affairs took place with the governor general of the Netherlands Indies. On Nov. 20 appointment was announced of Dr. H. J. van Mook, director general of the economic department of the Netherlands East Indies, and Hr. P. A. Kerstens, leader of the Roman Catholic party in the East Indies, as ministers respectively of colonies and of economics and shipping.

The royal Netherlands navy was active in the Allied cause, and the merchant marine was chartered to the British government. Dutch military forces organized in England received the name Royal Netherlands Brigade "Princess Irene."

On the occasion of her 61st birthday Queen Wilhelmina broadcast on Sept. 1 to Netherlanders throughout the world. In November an interesting ceremony took place in the Middlesex Guildhall, when members of the Dutch maritime high court were sworn into office, this being the first time that a foreign court of this nature had been established in England.

Immediately following the Japanese aggression in the Pacific in December the Netherlands was aligned with the Allied powers and declared war on Japan on Dec. 8, 1941. War was declared on Italy as from Dec. 11. (*See* also WORLD WAR II.) (H. F. D. B.)

In Occupied Holland.—Resistance of the Dutch people to the Germans increased during 1941 in the face of growing privations and accumulating terrors in the form of the Gestapo, concentration camps, forced labour, anti-Semitic laws and all the other familiar devices of German misrule. A sturdy campaign of opposition by the masses of the population provided many stories of

R.A.F. BOMBERS swooped so low over Dutch fields July 16, 1941 that their crews were able to wave to friendly farmers below

courage and ingenuity in weakening the morale of the invader, and open breaches occurred in February, when serious strikes and rioting followed repressive measures taken by the Germans after the killing of a Dutch nazi.

On July 28 it was reported that Dr. Hendrick Colijn, former premier, had been sent to a concentration camp with 60 other members of the dissolved antirevolutionary party. The banning of all national symbols, the nazification of the Dutch press, further anti-Semitic measures, stricter food and other commodity rationing, the completion of the economic incorporation of Dutch economy into that of the reich, and in July the dissolution of the leading political parties by the reich commissioner, Arthur Seyss-Inquart, were other manifestations of the "new order" in Holland. At the close of 1941, efforts were being engineered to set up a puppet government under the Dutch nazi leader, Mussert. (D. A. C.)

Education.—In 1938: elementary schools, 7,812; scholars, 1,242,778; secondary schools, 288; scholars, 62,301; high schools (1937–38), 4; scholars, 3,037; universities (1937–38), 6; scholars, 9,471.
